Because the actual sanctions against enterprises that polluted were weak, the follow-up to early advances in prevention was difficult. And with pollution fines less than treatment costs, it paid to pollute. State-owned businesses saw pollution charges (which totaled 6 billion yuan in 2001) as just one more state tax. Management was lax, inspections were few and sloppy, and treatment installations were turned off at times to save costs. As in other socialist countries, in China local governments were the owners of the enterprise, the monitors of its environmental performance, and the judges at the same time, and they feared that investments in the environment might come at the expense of employment and profits. The staffs of local environmental-protection bureaus were increased, but much of the time their hands were tied; decisions were made by bureaucracies rather than by law or public opinion. The differences in technological levels and scale within many industrial branches in China further complicated an imposition of uniform standards. China set ambitious targets for reduction of emissions by its industries,
but monitoring has been uneven, and small industries and farmers are hardly covered.

Industrial pollution has been spreading. By the mid-1990s one-half of China’s industrial production came from township and village enterprises, largely outside of the control of local environmental protection bureaus. It took time, considerable political effort, and concentrated action to close down the worst-polluting industries in the most affected areas of eastern China. Prompted by unacceptable levels of water pollution and drinking water disasters, cleanup programs were started for major cities, Taihu Lake, and medium-size river basins. As of 2004, more than 80 percent of the industrial wastewater discharged by urban industries was up to standard, compared with 50 percent in 1990. Polluting industries were driven to interior provinces and rural areas.

Problems are greatest in dry northern China, where industries and households make great demands on shrinking water resources. Economically, the most logical solution is to raise water prices and reduce the allocation to farmers, but this solution has met with political and practical objections. Since the 1990s the lower reaches of the Huang River run dry for several months a year and have become a sandy sewer. All main lakes and one-half of the sections of the Huai River, the Hai River, the Liao River, and several other rivers in eastern China are worse than the lowest quality standard. Northern and western China also burn much coal. In spite of greater energy efficiency and coal washing, rapid industrial growth (around 10 percent a year) pushed China’s total sulfur dioxide and soot emissions to 18 and 9.9 billion metric tons, respectively, in 2000.
Highest levels are found in the interior coal-burning cities in Shaanxi, Hebei, Chongqing, Guizhou, and Sichuan provinces.

China’s fast economic growth, improvements in education, foreign investment, and increased environmental awareness (leading to greater political pressure on municipal leaders to clean up their cities) were eventually the more important contributors—rather than legislation or punitive sanctions—to technological innovation, improved efficiency, and cleaner production of China’s industries. Shortages in energy (in particular electricity and oil) and water during the past two decades led to a more economic use of resources and a shift to more efficient technology. China has become an importer of raw materials such as cotton, pulp, steel, and oil and an exporter of finished industrial products.

Natural Disasters

The worst natural disaster in China in recent decades was the 1976 Tangshan earthquake, which by some estimates killed 240,000 people and destroyed somewhere between 600,000 and 10 million homes; some estimates place the number of dead as high as 750,000. (The death toll from the earthquake of 12 May 2008 was estimated to be about 70,000 and the number of homes destroyed about 3.5 million.) The annual death toll from earthquakes and landslides is about one thousand; severe droughts affect 10 million hectares of farmland every year, and serious floods about 5 million hectares, with one to three thousand lives lost and 3 million homes destroyed. Although the death toll of these natural disasters pales in comparison to the traffic death toll (which is almost 100,000 per year), their economic costs are enormous due to the damage to homes and other buildings, infrastructure, crops, and domestic farm animals. Official estimates report that annual direct economic damages have increased from 50 billion yuan in the 1950s to 60 billion yuan in the 1970s and over 100 billion yuan in the 1990s. But if one includes indirect losses because of deforestation, desiccation, pollution, and natural resource degradation, annual economic losses quadrupled to almost 20 percent of China’s GDP in the 1990s.

The vulnerability to destruction from floods will be reduced as people move out of low-lying areas along major rivers and as stricter building limits are imposed. China’s eighty-four thousand reservoirs have helped to reduce floods and store water for irrigation, but many reservoirs have become old, silted up, and outright dangerous. Dikes along main rivers have offered greater protection, but riverbeds have been raised by sediments and constricted by bridges and other structures. Increased afforestation programs and decreased grain cultivation in erosion-prone areas will help reduce both flood and drought damage.

International Cooperation

China’s environmental efforts have received considerable support—both institutional support, such as in legislation and training programs, and support for investment projects—from foreign countries and international organizations such as the World Bank. Other countries, for instance, have largely financed the elimination of chlorofluorocarbon (CFC) coolants in China’s refrigerator industry.

China’s principles in global environmental issues were laid down in 1990: the environment should be considered in the process of economic development; developed countries are largely responsible for current pollution; the interests of developing countries should not be hampered by so-called green demands; the world economic order should promote the participation of developing countries in solving global problems; and China as a large country will contribute to the global effort by reducing its own environmental problems.

China has supported most international treaties, and its membership in the World Trade Organization has brought it closer to international product standards. Its international stand is a clever combination of global concerns and self-interest in continued economic growth, which invites Western countries and companies to contribute to and participate in environmental improvements in China.

Environmental Movements

China’s increasingly industrialized economy has had a profound impact on the environment. Non-governmental groups and branches of international environmental groups have supplemented government efforts to gather information, to educate the public and industry to the effects of environmental degradation, and to monitor changes to the environment. Specialized functions of these organizations include technical support and legal advocacy for those harmed by pollution.

The environmental or green movement in China has experienced a steady evolution since the early 1990s, from the burgeoning of a few groups with limited goals to the flowering of a “green” civil sector with diverse focus and expertise. The number of environmental non-governmental organizations (NGOs) has shot up from a handful to over thirty-five hundred in less than two decades. These groups have become increasingly specialized in their operations and sphere of influence. But funding constraints, insufficient government facilitation, and lack of internal resources are major challenges to their future development.

The progress of China’s green movement has been coupled with the gradual increase in the complexity of China’s social and political structures as a consequence of the country’s fast economic development. Further expansion of the sector is likely to remain complex as the country’s economic, social, and political progress breaks down remaining barriers, giving the movement greater opportunity for influence. The movement itself will also serve as a catalyst to accelerate and facilitate change.

Beginnings of Green Movement

China’s green movement was galvanized by a special initiative of the central government. In the late 1970s the Chinese government introduced a series of environmental policies that laid the foundation for more sophisticated environmental laws and regulations to come. The Environmental Protection Bureau was established in 1982 under the Ministry of Urban and Rural Construction and Environmental Protection. In 1993 a pivotal event furthered China’s green movement: The country set up a powerful agency, the Environmental and Resources Protection Committee of the National People’s Congress (China’s legislature). Qu Geping, a veteran environmental expert who headed the Environmental Protection Bureau, became the committee’s director. Qu, revered as China’s “Father of Environmental Protection,” coordinated the effort by thirteen other government agencies and twenty-five media organizations to launch an annual nationwide campaign to publicize laws and regulations related to environmental and resources protection and to review progress of local governments in their implementation. Groups of journalists are dispatched each year to do on-site environmental investigations, and their findings are published throughout the media. The 1993 campaign...
brought environmental protection to wide public attention for the first time, and many participating journalists later became leaders and supporters of green NGOs. Those investigations still occur annually. Their influence, though declining as the sources for environmental information diversify, continues to be far reaching in bringing to the public attention the environmental woes that China faces.

Non-Governmental Organizations

China’s first independent environmental group was registered in 1994, shortly after the country enacted a law requiring legal registration of social organizations. The number of green groups mushroomed to 3,539 by October 2008. Limitations in the registration law, however, have resulted in a unique feature of the composition of environmental NGOs in China. The registration law requires all social NGOs to have a government sponsor that supervises their operations. As a result, of these 3,539 groups, 1,309 are organized by various government agencies who serve as their sponsors, several of which has been in existence long before the first independent green group got registered. Such groups are called government-organized NGOs, or GONGOs. There are also 1,382 student groups that are supervised by their respective university authorities and do not need legal registration.

Independent green groups, that is, grassroots NGOs, normally have difficulty finding a government sponsor, and international environmental groups do not have the right to register in China according to the current law. In order to circumvent the registration hurdle, the majority of these groups either register as businesses or as affiliates of universities or research centers. Some groups simply operate in a gray area without registration. The number of independent green groups is considerably smaller than GONGOs and student groups, with only 508 grassroots NGOs and ninety international environmental NGO branches.

Most environmental groups in China are concentrated in big cities on the east coast including Beijing, Shanghai, and Tianjin, or in ecologically strategic areas, such as Sichuan, Chongqing, and Yunnan in southwest China, that harbor intact forests, headwaters of major rivers, and rich biodiversity; others focus on Hubei and Hunan provinces, which contain the often heavily polluted middle and lower reaches of the Yangzi (Chang) River, or Inner Mongolia, Tibet, and the Xinjiang Uygur Autonomous Regions, which experience serious grassland degradation.

**Relationship of Economic Growth to Environmental Movement**

The robust emergence of China’s green NGOs is the direct consequence of the country’s breathtaking economic development. Almost three decades of near double-digit annual economic growth, which has lifted millions out of poverty, led to mounting environmental woes. Environmental protection, constantly at loggerheads with economic growth, has been losing out due to the paramount priority put on the economy by the government at all levels. Since China’s economy has progressed within three decades from a rudimentary rural economy to one of current heavy industrialization—one with such intensity, scale, and influence—environmental ills have become pervasive and acute, causing public health tolls without discrimination. China’s economic reforms have accompanied the sophistication of its economic and social structures, which sometimes renders the tight control from the central government ineffective, requiring it to invite help from outside of the government system, albeit with caution, to address issues pertinent to environmental protection.

**Growth of Environmental Movement**

Several factors have facilitated and accelerated the environmental movement in China. Its growth has been expedited by a series of milestone laws and regulations enacted by the central government. Those include the Rules for Registering Social Organizations in 1994 that grants legal status to NGOs, the Environmental Impact Assessment Law in 2003 that encourages broader public participation in policy decisions, and the Guidelines for Full Implementation of the Law of State Secrets in 2004 that forces government agencies to disclose unclassified information for public review. As such policy tools encourage public participation in environmental issues, advancement of modern communication technologies, such as the Internet and cell phones, have aided in information sharing and in organizational endeavors. Decades of dedicated public education by green NGOs have raised the general public’s awareness of environmental issues and have created a large, well-trained staff and volunteer pool.

Because the government still has the paramount power in addressing environmental problems, green NGOs in China tend to cooperate with the government instead of taking a confrontational approach against it. Initially, green groups engaged mainly in simple educational activities, such as encouraging water saving, animal protection, and promoting environmental education in schools. With the increase both in the number of NGOs and in their expertise, NGOs expanded their operations in the late 1990s to include forest, water, and wetland conservation, smoking prohibition, green consumption, energy saving and emissions reduction, and climate change. They nurtured public awareness and volunteer spirit through education and activities. They also provided studies and surveys for environmental policy making, cooperated with the government to supervise the implementation of environmental policies, and served as a watchdog to check powerful local governments and industries in environmental offenses.

The expanding scope of NGO activities has continued in China in recent years. Some NGOs have specialized in providing technical support, such as structuring a database for water and air pollution mapping, a green choice public interaction platform, and biodiversity protection mapping. Some focus on encouraging public participation
in environmental issues; others provide capacity building for civil groups or carry out surveys and investigations on specific issues. Several green groups have engaged in safeguarding public interests by providing pollution victims access to courts. Two such groups, the Center for Legal Assistance to Pollution Victims and the Center for Environmental Legal Service under the All China Environment Federation, have more than one hundred volunteer environmental lawyers among them and have helped millions of people who asked for legal assistance from 2005 to 2008.

A new operational mode has become popular as well. Confronted by the perennial shortages of funding, personnel, and other resources, green groups began to collaborate in recent years, integrating resources and dramatically enhancing their influence on policy making and attitudes of the general public. In July 2007, several green groups in Beijing initiated a campaign of “Public Action on 20 Percent Energy Saving”; more than forty groups nationwide participated in the efforts. Such alliances also advanced campaigns for reducing air pollution by driving less and coordinated emergency rescue and relief efforts after the massive earthquake in Sichuan in May 2008. These trends are likely to continue into the future.

**Challenges to Growth of Environmental Movement**

Despite the drastic advancement of the environmental movement in China, several key barriers constrain its future development. A major challenge lies in the government’s dubious attitudes towards green NGOs. Although the government needs the extra exposure from the environmental groups to address rampant environmental woes, it is still wary of their power. As a consequence, many government agencies are reluctant to share information with and to invite help from green NGOs, and the current registration limits will continue to quench the zeal of new independent grassroots groups.

Another major hurdle is the shortage of funds; more than half of all environmental NGOs see this as the greatest challenge to their future development. Philanthropic awareness has been very low in China. While business and individual donations are mainstream practices in developed countries, they are still minimal in China. Corporate social responsibility is a novel concept in the country, and businesses lack incentive to make donations for philanthropic endeavors. Individual donations are meager as well. Per capita donation in China is less than one yuan (one U.S. dollar is equivalent to about seven yuan), while in the United States that figure is $460 per capita. Individual donations in the United States account for 2.1 percent of its national gross domestic product, compared to only 0.01 percent in China. Thus funding channels for environmental groups are very limited, and they must rely on personal connections and international foundations or branches of international organizations. Green groups themselves are weak in fundraising capacity, and those registered as businesses lose their legal standing to raise funds. Funding from international foundations or branches of international environmental organizations, one of the major current funding sources for China's green groups, tends to be unreliable in amounts, terms, and specific objectives.

Those hurdles are likely to be overcome in time if the current rate of progress by government and other stakeholders continues. The central government has given higher priority to the environment and has incorporated environmental protection in its national development plan. Environmental performance has also become a benchmark in evaluating the performance of local officials, and success or failure in this area will directly influence their political careers. The institutional structure has been further upgraded: The Environmental Protection Bureau has become the State Environmental Protection Administration (SEPA), an independent agency below ministry level. SEPA was formally reorganized as the Ministry of Environmental Protection in 2008. The advancement of environmental protection on the government’s agenda will create greater opportunity for the green movement in China.

**Prospects for the Future**

In recent years, the business sector in China has gradually begun to cooperate with green NGOs. Although enterprises are the major targets of green groups, some have helped environmental groups in campaign activities for public welfare, social surveys, and exhibitions. Approximately one hundred entrepreneurs launched the Alxa SEE (Society, Entrepreneur, and Ecology) Ecological
The Alxa SEE Environmental Award was created a year later; at RMB¥3 million, it is the highest such award in China. Green groups in China will continue to get international assistance and cooperation. International environmental NGOs started to enter China in the 1980s, and now many major groups operate in China, including the World Wildlife Fund, the Environmental Defense Fund, the Nature Conservancy, Conservation International, the Worldwatch Institute, and the World Resources Institute. American and European foundations along with bilateral, multilateral, and regional development aid agencies have been increasingly active in supporting the work of environmental groups. One influential donor is the Blue Moon Fund, which has provided the seed money for the creation of the Beijing-based Global Environment Institute, an independent research institute. Such cooperation and partnership also helps capacity building and personnel training for local green groups.

Governmental and non-governmental organizations have arisen to deal with the environmental degradation that is a byproduct of China’s increasingly industrial economy. Governmental and civil structures have changed to accommodate operations of these green groups. While funding and administrative hurdles exist, the continued advancement of the effectiveness of these groups seems assured.

Whether from the pursuit of political and military power or from population pressure, China has suffered from unsustainable development for most of the past 3,000 years. The study of environmental issues in China is a relatively recent but rapidly growing science benefiting from the participation of scholars across several disciplines.

Since the later half of the twentieth century, environmental problems have become a major concern of the international community. In the beginning of the twenty-first century, it is even more evident that these problems must be solved to ensure the survival of humankind. China, a country that has suffered from unsustainable development for most of the past three thousand years, and which is now one of the most rapidly growing consumers of energy on the globe, will play an increasingly crucial role as both a subject of and player in the field of environmental studies.

Voices in a New Field

The environmental history of China emerged as a new field of historical study in the 1970s in response to contemporary environmental crises. Environmentalists,
social theorists, historians and other scholars in cross-disciplinary fields then began to write books on the subject and publish articles in journals, some of which devoted entire issues to the topic: In August 1972, the Pacific Historical Review concentrated on environmental history, and in June 1974, the Annales: Économie, société, civilisations published a special issue on the subject. Richard H. Grove traced the origin of environmental history to works of historical geographers dating from the mid-nineteenth century on. The social theorist James O’Connor argued that the socioeconomic and environmental crises of our time are interconnected and, going further, that capitalism was much to blame for current environmental problems.

In a 1993 article, Mark Elvin contended that unsustainable growth was observed in the past 3,000 years of Chinese history. He pointed out that in the early phase of this long period, the major impact on the environment came mainly from the pursuit of political and military powers, and in the later phase, from population pressure. He also described the process of deforestation and analyzed the over-development of irrigation systems. In 2004, Elvin published his major works on the environmental history of China in a huge volume, The Retreat of Elephants.

Elvin also organized the first conference on the environmental history of China, held in Hong Kong in December 1993, and invited scholars from multiple disciplines to participate. This conference produced two symposiums titled Sediments of Time, one published in 1995 with twenty-four Chinese articles and the other in 1998 with twenty-one English articles; they dealt with issues related to physical environment, human settlement, frontier, water, climate, disease, official representations of the environment, literary and popular sensibility, as well as case studies on the environment and modern economic growth in Taiwan and Japan. Following the 1993 conference, other conferences on the subject were held at Academia Sinica in Taipei in 2002 and 2006, and at Nankai University in Tianjin in 2005. The selected papers of the 2005 conference were published in 2007 and those of 2006 are forthcoming.

In the 1990s and 2000s, many works on the environmental history of China were written by younger scholars. Wang Xingguang explored the ecological and environmental changes and the rise of the Xia dynasty (2100–1766 BCE) with data discovered by archaeologists and palynologists (scientists who study pollen and spores), and as well with materials contained in ancient texts. Motoko Hara analyzed various ancient texts on the development and environment in ancient China, focusing on types of soil, trees and grasses, hills and mountains, dry land agriculture, irrigation, and cultivated crops. Robert Marks traced the development of the Lingnan region in south China from the Han dynasty (206 BCE–220 CE) to the Qing dynasty (1644–1912), focusing on settlement and ecological changes, population increase, climate change and agricultural production, grain trade and granary, land reclamation and development of mulberry fields, exploitation of the mountain areas, and the disappearance of tigers. Wang Lihua studied the dietary culture of northern China in the medieval period by focusing on climate, water, forest, food production and processing, as well as carrying capacity and population. Chao Xiaohong studied social and ecological changes in southern Shanxi during the Ming (1368–1644) and Qing dynasties by focusing on climate change, deforestation, soil erosion, water control systems, and management. James Reardon-Anderson discussed land use in Manchuria and Inner Mongolia during the Qing dynasty with an emphasis on migration and deforestation. John Richards described deforestation and intensified land use in China’s internal frontiers, including Hunan Province, the Yangzi (Chang) highlands, Guizhou Province, and Manchuria. Zhao Zhen studied the ecological changes in northwest China during the Qing dynasty by emphasizing migration, deforestation, and water resources. Bao Maohong gave a quite thorough review of studies of Chinese environmental history and pointed out four major aspects to be strengthened in the future:

- The theoretical basis of research
- The knowledge of ecology and environmental science and the moral concerns of contemporary environmentalism among historians
- The research on modern and contemporary environmental history of China
- The research on other countries for enhancing comparisons and academic exchanges.
Environmental Issues Explored

Since the 1980s, foreign researchers have bluntly disclosed environmental degradation and pollution in China. For instance, Vaclav Smil’s book *The Bad Earth* was finished in 1983 and was soon translated into Chinese as a restricted publication available only to an inner circle of scholars. Ten years later Smil published *China’s Environmental Crisis*, which discussed the environmental implications of population growth, land degradation reflected in soil erosion, desertification and toxification, highly unequal distribution of water resources, massive deforestation, unsustainable farming, economic modernization and the quest for a higher quality of life, rural energy shortage, and air pollution in cities. After assessing the gains and losses brought forth by China’s modernization plans, Smil (1993, 192) wrote: “China is obviously not alone in facing a prospect of continuing decline in the quality of its environment, nor is it alone in having to deal with it from a position of relative poverty and limited technical, research, and managerial capabilities. But its relatively limited natural resource endowment, the already dismal state of its environment, its huge and far from stabilized population, and the magnitude of its modernization plans present a uniquely incompatible combination.”

Reeitsu Kojima traced the development of industrializing Asia during the four decades between the 1950s and the 1990s and contended that mainland China had grown into the world’s largest source of environmental pollution. Kojima pointed out the following negative environmental conditions of China. First, China’s precipitation is comparatively much lower and its coastal stretch much shorter than that of Japan, implying its weak capacity to cleanse pollution. Second, China depends on coal as its primary source of energy and this implies lower energy efficiency, larger sulfur content, and the problem of cinder disposal. Third, the lavish use of chemical fertilizers and agricultural chemicals has caused soil and water pollution which, in turns, affects the growth of aquatic plants and fish. Fourth, the development of small- and medium-size industries in rural areas implies the danger of spreading pollution all over the country. Fifth, rapid urbanization has a consequence of rapid increase of household waste and sewage. Moreover, Kojima pointed out that in the early 1980s the advanced industrial countries made relatively large investments into environmental protection. For instance, the share of environmental investment in gross national product (GNP) was 1.85 percent in West Germany, 1.8 percent in the United States, 1.3 percent in Japan, and 1.1 percent in France. In 1990, the government statistics of China claimed that 0.7 percent of GNP was invested for environmental protection. This environment investment/GNP ratio was exaggerated, however, compared with the adjusted estimate of 0.28 percent. Thus, Kojima suggested that unless the ratio was raised by 2.5–3.0 percent, no environmental improvement would actually take place in China.

Elizabeth Economy, the author of *The River Runs Black*, mentioned the following indicators to show the seriousness of China’s environmental degradation:

- Sixteen of the twenty most polluted cities in the world were in China.
- Air pollution alone caused 300,000 premature deaths per year.
- More than 70 percent of the water in five of the seven major river systems was unsuitable for human contact.
- More than 25 percent of land had become desert, with the desertification rates twice those of the 1970s.
- Approximately 8 to 12 percent of China’s gross domestic product (GDP) has been lost due to environmental degradation.

The sinologist Judith Shapiro has analyzed the dynamics of anthropogenic environmental degradation in China during the era of Mao Zedong (1949–1976) in many journal articles as well as in her 2001 book *Mao’s War against Nature: Politics and the Environment in Revolutionary China*. Shapiro contended that problems such as population explosion, arable land limits, poverty, misguided policies and mistaken beliefs, and irrational price structures due to state ownership were often linked to environmental degradation; however, the underlying dynamics of such degradation lay in a nationwide war.
against nature. Shapiro analyzed this war against nature through four themes: political repression, utopian urgency, uniformity that ignored regional variation and time-tested local practices, and state-sponsored relocation into wilderness areas. This militarization of Chinese society in a war against nature had helped promote modernization projects that transformed the landscape and degraded the environment.

Shapiro also pointed out that, with the legacy of the Mao-era still at work, China’s explosive economic growth and the rush to industrialization since the 1980s were obvious sources of unfolding environmental crisis. Yet some signs of hope also appeared: Environmental nongovernmental organizations, student environmental clubs, and activist groups started to function and share information with overseas counterparts. For example, Global Village Beijing was awarded a major international environmental prize; Friends of Nature in Beijing and the Shaanxi Mothers Environmental Protection Association organized public cleanups and efforts to save endangered species. The traditional Chinese concept of “harmony between the heavens and the humankind” was also reemphasized by people from all walks of life. It seems that China’s government is determined to wash off the country’s reputation as one of the most polluted in the world.

Training a New Generation of Environmentalists

Since the 1970s, many Chinese universities have recognized the importance of training students in environmental sciences; since the 1990s, several have established Colleges of Environmental Sciences and Engineering (CESE). Peking University in Beijing started air pollution research in the 1970s and invited Professor C. S. Kiang of the Georgia Institute of Technology to be the Founding Dean of the College of Environmental Sciences in 2002; they further established the CESE in 2007 with an emphasis on interdisciplinary training and research. Nankai University in Tianjin started a course on environmental protection in 1973, set up the Department of Environmental Sciences in 1983, and established their CESE in 1998. Tongji University in Shanghai started to do research on industrial waste water in the 1960s, with an emphasis on water pollution; they established the College of Environmental Engineering in 1988 and their CESE in 1998. Zongshan University in Guangzhou (Canton) started research and teaching on environmental sciences and established their CESE in 2002, with emphases on water pollution control and wetland ecology. Chang’an University in Xi’an set up their CESE in 2003 with emphases on water control and geological resources. Kunming University of Science and Technology set up the Department of Environmental Engineering in 1978 and further developed the CESE in 1999 with a stress on pollution control in Yunnan Province. The Southwest Jiaotong University in Chengdu established the Environmental Engineering Department in 1998 with emphases on water pollution control, treatment of solid waste, and protection of built environment. Undoubtedly, these university programs have trained a number of experts to undertake the task of environmental protection and control in China.

The Official Approach

Since 1972, Chinese officials have participated in international environmental meetings, familiarizing themselves with world scientific knowledge and concern about growing environmental problems. At the same time,
they began to link with international environmental organizations and donor institutions, such as the World Resources Institutes, Resources for the Future, and the Ford Foundation, which were seeking permission to conduct projects in China. Moreover, persisting environmental problems forced them to reevaluate China’s development path. They also wished to leverage environmental issues to achieve other foreign policy goals. For instance, in 1994 the State Council approved China’s Agenda 21—a document aimed at guiding China’s sustainable development in the twentieth-first century in four major aspects: the overall strategy for sustainable development, social sustainable development, economic sustainable development, and rational utilization of resources and environmental protection—to echo that resolution of the U.N. Conference on Environment and Development in 1992. These factors have contributed to the central government’s strong commitment to environmental protection.

During the 1980s and 1990s, China developed a large body of environmental laws, and in 1998 the National Environmental Protection Agency was elevated to a ministry-level administration and renamed the State Environmental Protection Administration (SEPA). The SEPA was renamed Ministry of Environment Protection at the 2008 National People’s Congress. Although the post-Mao decentralization of power to the provinces and the emphasis on economic growth at the local level has prevented certain environmental policies from being implemented efficiently, China’s integration into the global economy has permitted the country to feel secure about its food supply, and this has allowed policy makers to think more about slowing down aggressive land reclamation. Moreover, floods in 1998 and 1999 encouraged Chinese scientists to analyze the role of logging, erosion, dikes, and the filling in of wetlands in promoting floods, leading the government toward a new appreciation of the environmental benefits of forests and wetlands. China’s central government now understands that environmental sustainability should be integrated into the country’s economic development.

Progress and the Future

What are the official viewpoints regarding China’s achievements in environment protection from the 1950s to the early 2000s? According to Jiang Chunyun, the editor of a team-compiled report on China’s environmental changes and controlling strategies, the achievements...
can be quantified from six aspects. First, in 2003 the planted area of forest reached 1.59 billion hectares and the forestry coverage rate was 16.6 percent, compared to 8.6 percent in the 1950s. Second, the annual area of grassland increased from 1.05 million hectares (1981–1985) to 2.6 million hectares (1991–1995), and from 1996 onward, the average annual increase of grassland was more than 2.7 million hectares. Third, the program of protecting biodiversity was initiated in the early 1980s, and by the end of 2003, the government had established 1,999 nature conservation sites with a total area of 14.4 million square kilometers, of which 13.8 million were on the land, which account for 14.37 percent of China’s total land area. Fourth, there was already some progress in controlling desertification since 1991, and a law controlling desertification was published on 1 January 2002. Fifth, a law controlling water and soil erosion was published in 1991, and by the end of 2000, there were 380,000 square kilometers brought under control. And finally, the pollution control in various aspects started to show recognizable effects. By the end of 2000, the total amount of pollutants was reduced by about 15 percent from 1995 levels.

Regardless of these achievements, environmental degradation has not been brought to a standstill. There are still several issues are of particular concern:

- The shortage of water resources
- The total disappearance of natural forests
- The expansion of desert area
- The aggravated erosion in certain localities
- The continued decrease of biodiversity
- The increasing frequency of natural disasters
- The lack of effective control of environmental pollution

Given these concerns, the impacts of environmental degradation on human health and national security are well recognized by the government.

According to the 2000 plan of the State Council, environmental programs in China will proceed in the first half of the twenty-first century with the following goals: to hold back environmental degradation from 2000 to 2010; to ensure ecological and environmental security from 2011 to 2030; and to establish an ecological civilization from 2031 to 2050. In order to reach these goals, nine strategies have been proposed:

- Overall planning and coordination
- Transformation of production mode
- Adoption of recycling economy
- Ecological rehabilitation
- Utilizing alternative energy
- Innovation in science and technology
- Development of ecological industry
- Building industrial demonstration belt
- Regional multiple renovation

In short, “If we do not solve the environmental problem in China, the world is going to be in a very bad way,” said Professor C. S. Kiang in 2007, reflecting the seriousness of the situation. There is no doubt that China’s environmental choices impact the world, and, as one of the most rapidly growing consumers of energy on the globe, China will play an increasingly crucial role as both a subject of and player in the field of environmental studies.

The erhu is a bowed, fiddle-like stringed instrument that originally came from Central Asia; it can be played solo as well as in an ensemble or an orchestra performance. The erhu’s sound box is usually hexagonal or octagonal in shape, while the front is covered with python skin which—since a 2005 government law—must come from farm-raised pythons.

The erhu is a fiddle-like musical instrument popular among the Han Chinese, the largest ethnic group in China; it is renowned for its versatile timbre. It can be sad and serene as well as exciting and vivacious. The range of the erhu is about three octaves, with its strings tuned a fifth apart to D and A. When an erhu musician uses the fingers of his or her left hand to press or slide on the strings, it creates sounds such as vibratos, trills, and harmonic tones. When the musician uses his or her right hand to push and pull the bow, it creates legato, staccato, and tremolo.

The first Chinese character of the instrument’s name, er, refers to the fact that it has two strings, although a variant has three. The second character, hu, indicates that this instrument belongs to the huqin family of bowed string instruments. In addition, the character Hu is a generic name for the non-Han ethnic peoples who lived north and west of China in ancient times. Indeed, according to Yue Shu (“Book of Music”), a classic of the Song dynasty (960–1279), erhu originated from xiqin, a two-stringed lute introduced by the Xi people in Central Asia around the tenth century. Other less popular names for erhu include nanhu and wengzi.

The erhu consists of three major parts: qingan (neck), qintong (resonator), and gong (bow), each made of different hardwoods. The neck has a qintou (curved tip).

A blind man plays an erhu on the streets of Beijing. Players hold the erhu in their laps and pull the bow between the strings. Photo by Tom Christensen.
with two qinzhou (tuning pegs) inserted on the side. The resonator, or sound box, usually takes a hexagonal or octagonal shape, and its front is covered with python skin, which gives the erhu its characteristic sound. In 2005 the State Forestry Administration of China began to require that the skin come from farm-raised pythons only. Two strings, originally of silk and now usually of metal, stretch between the pegs and the base at the bottom of the resonator. A qianjin (nut), a hoop of string or a hook of metal, either fixed or unixed, holds the strings to the neck somewhere in the middle. A qinma (bridge) of wood is placed between the strings and the python skin on the resonator. A typical erhu measures 81 centimeters (about 32 inches) from top to bottom. The bow, about the same length, consists of a stick and horsehair, whose tension is adjustable with screws. The player usually sits, resting the erhu on the lap, and pushes and pulls the bow horizontally between, instead of outside, the strings. Capable of creating the sound of human voices and imitating other natural sounds, the instrument can be very expressive.

Since the 1950s, a complete set of erhu variants has been developed for orchestra performance. The set includes the gaohu (high-pitched fiddle), which sounds higher than the erhu; zhonghu (middle-pitched fiddle), which plays the role of a viola; and dihu (low-pitched fiddle), which performs like a cello. Liu Tianhua (1895–1932), famous for his Bing zhong yin (“A Moaning Sick Woman”) melody, and Hua Yanjun (aka Abing, 1893–1950), celebrated for his Erquan ying yue (“A Moon in Two Springs”), played pivotal roles in uplifting erhu from a tool merely for accompaniment to its current status as a major instrument to be played solo, in a small ensemble, or in an orchestra.

Erlitou Culture
Èrlìtóu wénhuà 二里头文化

c. 1900–1500 BCE

Erlitou culture, often identified with the semi-legendary Xia dynasty, is the earliest state-level culture in ancient China and the earliest Chinese archaeological culture in which bronze was used extensively, primarily for the casting of ritual vessels.

Erlitou culture (c. 1900–1500 BCE) existed in early Bronze Age (the period of human culture characterized by the use of bronze) with its center in western Henan and southern Shanxi provinces. The culture is named after the archaeological site at Erlitou, Yanshi County, Henan Province. Some archaeologists divide the culture into two phases, with Dengxiafeng in Henan Province as the type site of the eastern phase and Erlitou as the type site of the western phase. A Chinese national project to determine the chronology of the Xia (c. 2100–c. 1766 BCE), Shang (1766–1045 BCE), and Zhou (1045–256 BCE) dynasties dated the Erlitou site from about 1860 to 1545 BCE, but some more recent analyses of the radiocarbon samples suggest that the site began to be extensively occupied only after 1750 BCE.

Remains associated with the city-settlement at Erlitou cover an area of 300,000 hectares, making it the largest known site of this period in China. It lay at the core of a network of smaller settlements and villages in a “four-tiered” hierarchy. Thus, many archaeologists regard Erlitou culture as representing the earliest state in ancient China. This state would have been limited geographically to the region occupied by Erlitou culture in Henan and Shanxi provinces, but the cultural influence of Erlitou culture spread well beyond its immediate borders.

Many historians identify Erlitou culture with the Xia dynasty mentioned in the traditional histories. But no contemporaneous writing has yet been discovered, and the earliest references to the Xia are from the Zhou dynasty. Chronological problems also remain in matching the historical records to the archaeological culture. Thus the identification of Erlitou with the Xia dynasty remains a matter of dispute.

The Erlitou settlement was not walled, but it was well protected by its position between the Yi and Luo rivers, and traces of a boundary ditch to the north and west have been discovered. The city was large and neatly laid out, including a central walled “palace” precinct that enclosed the tamped-earth foundations of large-scale wooden buildings. This precinct occupies an area of about 10.8 hectares and is enclosed by a grid of wide roads (10–20 meters across) on all four sides. The roads have traces of carriage wheels.

At least eight foundations of large structures have already been identified or excavated. The first two discovered have been reported the most extensively; the larger is 100 by 108 meters (Foundation 1), and the smaller (Foundation 2) is 58 by 73 meters. Foundation 2 is aligned on a central axis with the more recently discovered Foundation 4 and must have been contemporaneous with it. The shape of the precinct is a vertical rectangle, and it is cosmologically (relating to a branch of metaphysics that deals with the nature of the universe) oriented along a north-south axis, as are the building foundations.

These large-scale buildings are usually described as...
palaces because of their size and because they are arranged in the courtyard architectural style characteristic of later Chinese palaces and temples. Some of them may not have been residences but rather ancestral halls or other ritual structures. The city, with its palace precinct and cosmological orientation, had already taken the form that characterized later Chinese capitals, which were political and ritual centers. Moreover, the courtyard architectural style for major buildings is that of elite architecture in traditional China through the ages.

Erlitou culture marked the beginning of the Bronze Age in China. Although small pieces of bronze dating to the third millennium BCE have been found at many sites in China, a bronze foundry has been found at Erlitou, and bronze ritual vessels were first cast there. The characteristic segmented (piece) mold method that is unique to the Chinese bronze-casting tradition was already in use. Vessels of the Erlitou culture are small and if decorated at all only in a rudimentary manner. The jue—a tripod with a long spout and side handle—is the most common vessel type, but other vessel types with legs and handles (called jia, he, and ding) have also been found. The complexity of their shapes suggests that the technology had already undergone a period of development. Turquoise, bone, and pottery workshops have also found at Erlitou.

Most of the bronze ritual vessels of the Erlitou culture are wine vessels. Other bronze artifacts include bronze plaques inlaid in turquoise with a two-eyed motif. Where excavated scientifically, these were found in tombs in the chest position, suggesting that they may have been sewn on clothing. A dragon-like figure made of small pieces of turquoise that must have been attached to some perishable material has also been excavated. Its position in the tomb was the same and probably served the same purpose. This complex of mortuary artifacts also includes bronze bells near the waist (or hand) and jade baton-like objects. Thus, these tombs may have been those of a special class of religious practitioners.

Bronze plaques similar to those found at Erlitou have also been found in the Guanghan region in Sichuan Province, which had developed its own bronze culture (Sanxingdui) by the late Shang dynasty.

The fifty-five officially recognized ethnic minorities, numbering about 110 million people, inhabit virtually all parts of China, though they are more numerous in the west. Ethnic minority homelands make up more than half of China’s land area. Government programs to bring some of eastern China’s prosperity to the west have met with mixed results.

China refers to itself as a multiethnic state. The government recognizes fifty-five ethnic minority groups (shaoshu minzu), in addition to the majority Han. They account for about 110 million people, less than 10 percent of the national population. Nonetheless, China’s minority population size surpasses all but ten countries. Due to a relaxed policy in sparsely populated areas of the country, where most minorities reside, ethnic minority birth rates slightly exceed the national average. Ethnic minority homelands are known as “nationality autonomous areas,” and include 5 province level regions, 31 prefectures, and 105 counties. Taken together, these areas cover more than half of China’s land, including 90 percent of its border area, and provide the nation with much of its forest reserves, animal meat products, minerals, and medicinal herbs. However, in most cases the indigenous ethnic minority population of each autonomous area accounts for less than half of its total population. Moreover, immigration into some of these areas by Han Chinese has
increased. This is especially true for the Xinjiang Uygur Autonomous Region (XUAR) and the Tibetan Autonomous Region (TAR).

The largest minority group is the Zhuang with over 15 million members who inhabit the Guangxi Zhuang Autonomous Region and areas of Yunnan, Guizhou, Hunan, and Guangdong provinces. The smallest minority group is the Lhoba with about two thousand members who live in the southwestern part of the TAR. Only the Mongolians, Zhuang, Hui, Tibetans, and Uygur ethnic groups reside in province-level entities that are specifically designated as their respective autonomous regions. Eighteen national minorities have over one million members. Twenty-two have fewer than 100,000 members and seven have fewer than 10,000 members. Ethnic minorities inhabit virtually all parts of the country, including rural, urban, mountain, coastal, and border areas, though they are more numerous in western China. The proportion of minority inhabitants in an autonomous area varies greatly. For example, Tibetans account for over 90 percent of the TAR but Mongols are only about 16 percent of the population of the Inner Mongolian Autonomous Region (IMAR). In the case of Tibetans, more reside outside the Tibetan Autonomous Region in adjoining Chinese provinces (Qinghai, Gansu, Yunnan and Sichuan), which together with the TAR, is often referred to as ethnic Tibet. Smaller groups like the Qiang or Dongxiang have only one county-level territorial jurisdiction. The Muslim Hui are somewhat unique among China’s ethnic minority groups in that they are scattered throughout China, though they also have the jurisdiction of the Ningxia Hui Autonomous Region.

Mongols, Koreans, Kazakhs, Uzbeks, Kirgis, Dais, and Russians are the principal ethnic nationality of nations adjoining China. Other groups such as the Miao, Lhoba, and Deang are not only minorities in China, but also on the other side of the border in neighboring countries. Finally, some groups have had a separate tradition of relations with religious brethren in other parts of the world. The Hui, Dongxiang, Uygurs, and other Islamic groups have religious ties with areas of the Middle East, and many attend the hajj (the pilgrimage to Mecca, Saudi Arabia, prescribed as a religious duty for Muslims) at some time in their lives. Groups such as the Miao and Tibetans maintain strong ties with their overseas refugee communities. Global trade, easier air travel, and the Internet have strengthened ethnic networks across national borders.

China’s concern with its multiethnic borders, especially after the collapse of the Soviet Union, led to the formation of a five-nation Shanghai Cooperation Organization to secure stability across its border regions with Russia, Kazakhstan, Kyrgyzstan, Tajikistan, and China.

Although fifty-five ethnic groups live as minorities within a Han Chinese dominated nation, some ethnic groups could be considered as double minorities. For example, the Xibe, Kazakh, Kyrgyz, Uzbek, and Tatar are ethnic minorities within the XUAR, as are the Luoba and Moinba in the TAR. Other ethnic minorities such as the Miao and Yao, who have lived in close proximity to one another for hundreds of years, have forged their own special relationship. Migration has also influenced the context of ethnic minority relations. Many Han migrate...
to ethnic minority regions due to higher pay for work in hardship areas, other opportunities to prosper, crowded conditions in their former areas, being stationed in army units, and job assignments after graduation from college and university. Whereas the Han composed 6.2 percent of the population of the XUAR in 1953, they numbered close to 40 percent by 1973. Such trends are also occurring in the TAR, where Tibetans have come to account for only half the population in the capital city, Lhasa.

Religion is pervasive among most of China’s minorities, and has traditionally been the main form of organized education outside of the family. Monasteries, mosques, and churches, which predate state schooling, remain repositories of traditional values and learning, and continue to flourish, although within tight government restrictions. State schools sometimes compete with religious institutions when it comes to education, especially in terms of financial contributions from minority households and attendance rates. After the Cultural Revolution (1966–1976), when ethnic values were criticized and class struggle predominated in politics and social relations, the government attempted to win back the support of ethnic minorities by increased autonomy in cultural expression, including in language and religious practices. Nevertheless, religious autonomy in the context of a socialist authoritarian government has been more a matter of degree. Religion is increasingly tolerated, and even encouraged when it helps tourism, yet severely limited when it threatens the authority of the Communist Party.

Most of China’s minorities have a strong religious tradition. Some, such as the Hui, are identified largely on the basis of their religion. Members of the Hui, Uygur, Kazakh, Kyrgyz, Tatar, Uzbek, Tajik, Dongxiang, Salar, and Bonan are adherents of the Islamic faith. The Tibetans, Mongolians, Yugurs, and Tus are adherents of Lamaism. The Dai, Bulang, and Benglong are adherents of Hinayana Buddhism. The Oroqen, Daur, and Ewenki practice shamanism. The Drung, Nu, Va, Jingpo, and Gaoshan are adherents of polytheism as well as totemism and ancestral worship. A small number of Catholics and other Christians can be found among the Koreans, Miao, Yao, Lahu and Yi. Moreover, some ethnic groups, including Bai and Tibetan, have a long standing sub-community of believers of Islam, though they strongly identify with their respective ethnic group.

With the exception of the Hui and Manchu, who generally speak Mandarin, all minorities have their own spoken language, with some having more than one. Most of the languages belong to the Sino-Tibetan and Altaic families, while some belong to the South Asian, Austronesian, and Indo-European families. Before 1949 only twenty minorities had their own written language. Those in most common use were the Mongol, Tibetan, Uygur, Kazakh, Korean, Xibe, Dai, Uzbek, Kyrgyz, Tatar, and Russian scripts. Others included Yi, Miao, Naxi, Jingpo, Lisu, Lahu, and Va. The government helped to derive a written script for nine ethnic minorities formerly without one. Still, many minorities remain without a written script, such as the 300,000-strong Dongxiang, and 300,000-strong Qiang minorities. While most of the Manchu have long since abandoned their script and commonly use Chinese, others groups such as the Jingpo speak a variety of languages. Some are trilingual, speaking their native tongue, the language of the ethnic minority group in closest proximity, and Mandarin Chinese. For example, many Xibe and Kazakh in the Xinjiang Uygur Autonomous Region would learn to speak the Uygur language before Chinese.

The Constitution, Regional Autonomy, Government Organs, and Policies

The Constitution of the People’s Republic of China states:

Article 4. All nationalities in the People’s Republic of China are equal.

The state protects the lawful rights and interests of the minority nationalities and upholds and develops the relationship of equality, unity and mutual assistance among all of China’s nationalities. Discrimination against and oppression of any nationality are prohibited; any acts that undermine the unity of the nationalities or instigate their secession are prohibited. The state helps the areas inhabited by minority nationalities speed up their economic and cultural development in accordance with the peculiarities and needs of the
different minority nationalities. Regional autonomy is practiced in areas where people of minority nationalities live in compact communities; in these areas organs of self-government are established for the exercise of the right of autonomy. All the national autonomous areas are inalienable parts of the People's Republic of China. The people of all nationalities have the freedom to use and develop their own spoken and written languages, and to preserve or reform their own ways and customs. (Constitution of the People's Republic of China, 1982).

The Law on Regional Autonomy for Ethnic Minorities, adopted in 1984 at the Second Session of the Sixth National People's Congress, includes provisions for autonomous organizations; rights of self-government organizations; help from higher-level organizations; training and assignment of cadres, specialists, and skilled workers among the minority peoples; and the strengthening of socialist relations among ethnic groups. In short, the policy has been characterized as one state but many ethnic groups. Problems remain regarding autonomy and self-determination. Although the 1984 law is far-reaching, it lacks any bite as long as the law is subject to the power monopoly of the Communist Party. The idea of “autonomy within a unified state” is defined by the principle of “democratic centralism,” wherein there is subordination of the individual to the organization, subordination of the minority to the majority, subordination of the lower levels to the upper levels, and subordination of the whole party to the central committee (Heberer 1989). In theory this idea still permits ethnic minorities to enjoy an “equality of status.” In reality the autonomy may be severely restricted. A greater degree of autonomy would require a broader separation of party and state. Also, autonomy is tied to a territory; it comes by virtue of residing within a designated national minority autonomous area. More than ten million ethnic minorities live outside of their respective autonomous areas.

Ethnic minority work at the national level is carried out through various government bodies. The State Ethnic Affairs Commission is under the State Council—the highest administrative organ in the country, and is charged with the authority to supervise and inspect the implementation of policy in ethnic minority regions. This includes ensuring a degree of equality among ethnic groups, strengthening interethnic unity, training minority cadres, and managing ethnic minority work in general. At the local level the People’s Congresses of some provinces and autonomous regions have an ethnic affairs committee or section. Many minority cadres are trained at one of about thirteen nationality colleges, six of which are administered by the State Ethnic Affairs Commission.

A variety of general policies toward ethnic minorities have been in effect since the founding of the People's Republic of China in 1949. Initial efforts were directed at recruiting ethnic minority elites into the government and ruling Party. The 1950–1957 period was marked by the formulation of national-level policies directed at unification and consolidation on the one hand and at ethnic solidarity on the other. However, the formation of nationwide cooperatives strained relations between the Han and the ethnic minorities. The failure of the Great Leap Forward (1957–58), an economic and social plan to rapidly transform China from an agrarian economy of peasant farmers into a modern, industrialized Communist state, led to a difficult period of ethnic relations. After the Great Leap Forward the government moved back to a position of granting more autonomy to ethnic minorities. This position was short-lived, however, as the excesses of the Cultural Revolution led to extreme suffering among minority groups in China. Temples were destroyed, religious customs were violated, and language systems were changed.

During the Cultural Revolution, leaders declared that ethnic minority policy was no longer needed because China was not a multiethnic country. Minorities and their territories were no longer considered special. The autonomous units in many regions were dissolved. Officials used ideologically driven economic policies and faulty logic such as the ordering that certain types of rice be planted regardless of the area's special agricultural conditions. Literacy in minority languages decreased, and almost all ethnic minority schools and colleges were closed. Ethnic minority languages were condemned. The wearing of national costumes was prohibited, and ethnic songs and dances were viewed as feudal or capitalistic. Some ethnic minority health practices were viewed as superstitious and curtailed.

China's economic reforms and opening to the outside world, which began in late 1978, ushered in a period
of renewed emphasis on the cultural distinctiveness of minorities and promoted a respect for their traditional cultures. However, economic policy was directed more toward a rapid development of the coastal regions of eastern China, thus opening up an economic gap between the prosperous east and the poorer western parts of the country where most ethnic minority groups lived. A special series of policies was developed and implemented beginning in the 1990s to rectify this problem by promoting investment in western China, but it has met with mixed results.

Historical Perspectives
The origins of the Han majority can be traced far back in Chinese history. The Yellow Emperor of the twenty-seventh century BCE, chief of the league of tribes that ruled northwestern China, brought the ethnic groups of the Huang (Yellow) River under unified control. This unification led to the gradual formation of the Xia people, said to be the ancestors of the present-day Han. Several thousand years of Chinese history have left evidence of hundreds if not thousands of separate groups.

The scholarly discourse in China depicts the Han majority as a group that resulted from an intermixing and fusion of many peoples over several thousand years. Relations between the minorities and the Han are viewed as having gone through many stages. During the feudal period the dominant ethnic group often held other groups in contempt, and the distance of a people from cultural center of China could determine their level of subjugation. All groups were permitted to pay homage to the emperor, given a lower place within the scheme of social status, and sometimes allocated defense from others by the Han militia. Confucianism, the doctrine that ruled China for centuries, supported this view toward outsiders and promoted nonviolent assimilation rather than the extermination of other groups. The major means of nonviolent assimilation was through an education that stressed the conventions of behavior and morality as prescribed by the Confucian classics.

In early times the Chinese territory was in the north plain of what is present-day China. The Qin dynasty (221–206 BCE) unified the group of warring states and groups were either assimilated into the empire or moved out of the area. The Han dynasty (206 BCE–220 CE), is commonly considered to be one of the greatest periods of Chinese history, and the Han Chinese came to represent the cultural majority.

Throughout Chinese history, the Han and other ethnic groups fought wars in which an intricate web of relations evolved. Moreover, two of China’s fifty-five ethnic minorities, the Mongol and the Manchu, actually ruled China for hundreds of years. After emerging victorious, these groups ruled by assimilating themselves into Han Chinese ways associated with dynastic rule. The cultural assimilation of the Manchu, who ruled for 267 years (during the Qing dynasty, 1644–1912), is viewed as more complete than for the Mongol who ruled for the 97 years of the Yuan dynasty (1271–1368). While the Mongol of China maintained their written script, the Manchu have long
abandoned theirs, though some Manchu have recently developed a renewed consciousness of their ethnicity.

The Qing dynasty employed a full range of methods to control ethnic minority groups. It used force against the Yi rebellion in the seventeenth century and the two Muslim rebellions of the nineteenth century. Other methods of persuasion during the Qing dynasty included the tribute system (board of rights); court of colonial affairs (mainly for Mongol, Tibetan, Hui and several other Muslim groups); native official system; Han migration to minority areas; and the incorporation of minority areas into the state administrative system. The Asian scholar June Dryer notes that the “goal of the Qing and other dynasties was a pluralistic form of integration that aimed at little more than control” (1976, 12–13). The minimum requirement was a vague commitment of loyalty to the emperor and abstention from aggression. Traditional customs that did not pose a threat to the Chinese state were not interfered with. The imperial bureaucracy seldom if ever penetrated the county level to the countryside and villages. Minority areas came under Chinese control not only through their absorption of Chinese values, as in the case of the Naxi, but also through Han migration to those areas.

In the early part of the twentieth century, when the Nationalist government ruled China beginning in 1911 (although the Qing emperor did not abdicate until 1912), minority territories often changed hands, and ethnic relations were relatively unstable. Decision-making processes became diffused among warlords, foreign powers, and numerous factions of the Nationalist Party. The ethnic minorities mistrusted the Nationalist government due to arrogant officialdom and the expropriation of ethnic minority lands. Except possibly somewhat in the case of the Zhuang and the Bai, efforts toward assimilation failed. However, aside from the loss of Outer Mongolia, China’s territorial claims since the Qing dynasty were maintained. After their victory in the Civil War, the Communists promulgated policies toward minorities that stressed equality among all ethnic groups, the right of autonomy within a unified state, a united front with cooperation between the Chinese state and upper-class ethnic and religious leaders, respect for ethnic minority cultural ways, the right to education in one’s native language, and the development of a higher standard of living for ethnic minorities.

China was not always unified, and the concept of nation is a relatively recent notion in China. The Chinese concept of nation was unlike the European one with its subjective-legal meaning. Rather, the Chinese concept was territorial and historical and reflected the similarity among Chinese terms for people (minzu), nation (minzu), and nationality (minzu).

Sun Yat-sen, the founder of the Republic of China, regarded China as a republic of five nationalities: Man (Manchu), Meng (Mongol), Zang (Tibetan), and Hui (including the many Muslim nationalities). In the 1930s the Nationalist government denied that ethnic minorities
Ethnic Minorities

existed in China, claiming that all groups were branches of the Han. Soon after the founding of the People’s Republic of China in 1949, some four hundred groups answered the call to register as ethnic minorities, a number of whom became classified as members of the same group or were considered as Han Chinese. Over 700,000 people remained ethnically unclassified.

China has long relied on Soviet leader Joseph Stalin’s recognition of an ethnic group as a community of people that share a common language, territory, economic life, and common culture. However, this presented difficulties because some groups in China lacked a common language or territory. For example, the Hui were spread across the country and largely defined only on the basis of their Muslim religion and the Manchu no longer had a common language. Therefore, the definition came to be employed with some flexibility in China. In 1922 the Second Congress of the Chinese Communist Party (CCP) supported Russian Communist leader Vladimir Lenin’s formulation for the establishment of republics for non-Han Chinese ethnic nationalities. Theoretically these republics would have the authority to become independent if they chose. However, in 1935 the Communist Party moved in the direction of regional autonomy instead of federalism. While the CCP used the Soviet Union’s nationalities policy as a model, it was tempered by the Chinese Communist Party’s view that the right of session was incompatible with China’s situation. In short, the notion of regional autonomy was circumscribed such that it could not act contrary to prescriptions of the central government.

The persistent tendency of adherence to many of the basic principles underlying the policies borrowed from the former USSR in the 1950s has left China with a highly political approach to ethnic relations. The politicization approach is increasingly viewed as being out of step with a globally emergent China. There is a resurgent interest in the culturalization approach that is said to have characterized China over thousands of years and resulted in a united-pluralistic society through cultural assimilation across a massive and diverse population.

The early years of the PRC were characterized by moderation and flexibility, with the provision of infrastructure for building, legislation for achieving equality, and efforts to improve the economic position of ethnic minorities. Ethnic minority cadres were trained and efforts were made to promote the idea that each ethnic group had something to learn from and contribute to the others. However, since that time minority policies have gone through changes based on shifting political campaigns, economic development policies, and degrees of nationalism expressed by majority and minority groups. China’s stress on national unity, not only with respect to Taiwan, Hong Kong and Macao, but also with the TAR and XUAR, has been pervasive. The uniqueness of being the only country on the face of the earth with an unbroken civilization of four thousand years has intensified the mission to protect national unity. China’s reappearance as a global power has also reinforced this mission. Unfortunately, the notion that the Han Chinese are culturally superior to other ethnic groups is ubiquitous.

Ethnic Relations
Zúqún guānxì 族群关系

China is a multiethnic country with fifty-six officially recognized ethnic groups: fifty-five minorities and the majority Han. But this understates the divisions within the Chinese population, especially the variety of culturally and ethnically diverse groups within the Han population. For the many peoples of the People's Republic to participate fully in building a strong and prosperous future, China's ethnic communities need to be appreciated, officially and unofficially, for fostering a rich multicultural heritage.

Foreigners and the Chinese themselves typically picture China's population as a vast monolithic Han majority with a sprinkling of exotic minorities living along the country's borders. This understates China's tremendous cultural, geographic, and linguistic diversity. China is officially a multiethnic country with fifty-

“Long Live the Great Unity of All Nationalities,” 1960. A poster showing Mao leading a merry group of people representing China’s different ethnic nationalities. COLLECTION STEFAN LANDSBERGER.
six recognized ethnic groups: fifty-five minority groups, and the majority Han. China boasts that its minorities are involved in local and national governance, in the effort to prove that China has a socialist system representing the many peoples of the People’s Republic democratically.

**Nationality in China**

Officially, China is made up of fifty-six nationalities: one majority nationality, the Han, and fifty-five minority groups. Results from the 2000 census suggest a total official minority population of nearly 104 million, or approximately 9 percent of the total population. The peoples identified as Han comprise 91 percent of the population from Beijing in the north to Guangzhou (Canton) in the south and include the Hakka, Fujianese, Cantonese as well as the Sichuanese, Hunanese, Yunnanese, and Hainanese.

The rest of the population is divided into fifty-five official minority nationalities that are mostly concentrated along the borders, such as the Mongolians and Uygurs in the north and the Zhuang, Yi, and Bai in southern China, near Southeast Asia. Other groups, such as the Hui and Manchus, are scattered throughout the nation, and there are minorities in every province, region, and county. An active state-sponsored program assists these official minority cultures and promotes their economic development. The outcome, according to China’s preeminent sociologist, Fei Xiaotong, is a unified multinational state.

**Divisions within the Majority**

But even this recognition of diversity understates the divisions within the Chinese population, especially the wide variety of culturally and ethnically diverse groups within the majority Han population. Although presented as a unified culture—an idea also accepted by many Western researchers—Han peoples differ in many ways, most obviously in their languages.

The Han speak eight mutually unintelligible languages: Mandarin, Wu, Yue, Xiang, Hakka, Gan, Southern Min, and Northern Min. Even these subgroups show marked linguistic and cultural diversity. In the Yue language family, for example, Cantonese speakers are barely intelligible to Taishan speakers, and the Southern Min dialects of Quanzhou, Changzhou, and Xiamen are equally difficult to communicate across. The Chinese linguist Y. R. Chao has shown that the mutual unintelligibility of, say, Cantonese and Mandarin is as great as that of Dutch and English or French and Italian. Mandarin was imposed as the national language early in the twentieth century and has become the lingua franca (common language), but it must often be learned in school and is rarely used in everyday life in many areas.

The notion of a *Han ren* (Han person) dates back centuries and refers to descendants of the Han dynasty that flourished at about the same time as the Roman Empire. But the concept of *Han minzu* (Han nationality) is a modern phenomenon that arose with the shift from the Chinese Empire to the modern nation-state. In the early part of the twentieth century, Chinese reformers had been concerned that the Chinese people lacked a sense of nationhood, unlike Westerners and even China’s other peoples, such as Tibetans and Manchus. In the view of these reformers, Chinese unity stopped at the clan or community level rather than extending to the nation as a whole.

The great republican leader Sun Yat-sen was a Cantonese. In his plans to depose the Manchu-ruled Qing state (1644–1912), the last imperial dynasty, Sun sought to unite and mobilize the Han and all other non-Manchu groups in China—including Mongols, Tibetans, and Muslims—into a modern multiethnic nationalist movement. He succeeded in the revolution of 1911–1912 and established Republican China (1912–1949). The Han were seen as a unified group distinct from the internal foreigners—Manchus, Tibetans, Mongols, and Hui—as well as the external foreigners, Westerners and Japanese. Some scholars have argued a racial basis for this notion of a unified Han *minzu*. Other scholars have suggested the rationality was more strategic and nationalistic: the need to build national security around the concept of one national people, with a small percentage of minorities supporting that idea.

**North–South Divide**

Cultural perceptions among the Han often involve broad stereotypical contrasts between north and south. Northerners tend to be thought of as large, broad faced, and light skinned. Southerners are depicted as small and dark.
Cultural practices involving birth, marriage, and burial differ widely. For example, the Fujianese, southerners, are known for vibrant folk-religion practices and ritualized reburial of corpses. Hakka people are thought to be hard-working and their women independent minded, so much so that they refused to bind their feet. Many of these customs are nonexistent in the north. Northerners and southerners have radically different eating habits. Northerners eat noodles from wheat (and other grains), meats like lamb and beef, and prefer spicy foods. Southerners’ diet is based on rice and less meat in favor of seafood, and the food is generally milder than in the north, especially along the coast.

With the dramatic economic explosion in South China in recent years, southerners have begun to assert cultural and political differences. Cantonese rock music, videos, movies, and television programs, all heavily influenced by Hong Kong, are now popular throughout China. Whereas comedians used to poke fun of southern ways and accents, southerners now scorn northerners for their lack of sophistication and business acumen. As any Mandarin-speaking Beijing resident will admit, bargaining for vegetables or cellular telephones in Guangzhou or Shanghai markets is becoming more difficult for them because of the growing pride in the local languages: non-native speakers always pay a higher price.

National Unity

Sun Yat-sen popularized the idea that there were five peoples of China: the majority Han, Manchus, Mongolian, Tibetan, and Hui (a term that included all Muslims in China, now divided into Uygurs, Kazakhs, Hui, Uzbeks, Tatars, Salars, Dongxiang, Bonan, and Tajiks).

The Communists expanded the number of peoples from five to fifty-six but kept the idea of a unified Han group. The Communists were, in fact, disposed to accommodate these internal minority groups for several reasons. The Long March (1934–1935), a 6,000-mile trek across China from southwest to northwest to escape the threat of annihilation by Chiang Kai-shek’s Guomindang, forces, took the Communists through some of the most heavily populated minority areas in China. Harried on one side by the Guomindang and on the other by fierce “barbarian” tribesmen, the Communists were faced with a choice between extermination and promising special treatment to minorities—especially the Miao, Yi (Lolo), Tibetans, Mongols, and Hui—should the party come to national power. The Communists even offered the possibility of true independence for minorities. Chairman Mao frequently referred to Article 14 of the 1931 Chinese Communist Party constitution, which recognized the right of self-determination of the national minorities in China, their right to separation from China, and their right to the formation of an independent state for each minority.

This commitment was not kept after the founding of the People’s Republic in 1949. Instead, the party stressed maintaining the unity of the new nation at all costs. The recognition of minorities, however, also helped the Communists’ long-term goal of forging a united Chinese nation by solidifying the recognition of the Han as a unified majority. Emphasizing the difference between Han and the minorities helped to de-emphasize the differences within the Han community. The Communists incorporated the idea of Han unity into a Marxist ideology of progress with the Han in the forefront of development and civilization, the vanguard of the people’s revolution. The more backward or primitive the minorities seemed, the more advanced and civilized the Han seemed and the greater the need for a unified national identity. Cultural diversity within the Han is seldom mentioned because of a fear of the country breaking up into feuding warlord-run kingdoms, as happened in the 1910s and 1920s.

China has historically been divided along north/south lines or into five kingdoms, warring states, or areas controlled by local warlords as often as it has been united. China as it currently exists—including large pieces of territory occupied by Mongols, Turkic peoples, Tibetans, and others—is three times larger than China was under the last Chinese dynasty, the Ming, which fell in 1644. Ironically, geographic China, as defined by the People’s Republic, was actually established by foreign conquest dynasties, first by the Mongols and finally by the Manchus. A strong, centralizing Chinese government (whether of foreign or internal origin) has often tried to impose ritualistic, linguistic, and political uniformity within its borders. The modern state has tried to unite its various peoples with transportation and communications networks and an extensive civil service. In recent years
Minority Recognition

China’s policy toward minorities involves official recognition, limited autonomy, and unofficial efforts at control. The official minorities hold an importance for China’s long-term development that is disproportionate to their population. Although totaling only 8.04 percent of the population, they are concentrated in resource-rich areas spanning nearly 60 percent of the country’s landmass and exceed 90 percent of the population in counties and villages along many border areas of Xinjiang, Tibet, Inner Mongolia, and Yunnan. While the 1990 census recorded 91 million minorities, the 2000 census is estimated to report an increase of the minority population to be 104 million.

Shortly after taking power, Communist leaders sent teams of researchers, social scientists, and party cadres to the border regions to identify groups as official nationalities. Only forty-one of the more than four hundred groups that applied were recognized, and that number had reached fifty-six by 1982. For political reasons, most of the nearly 350 other groups were identified as Han or lumped together with other minorities with whom they shared some features. Some are still applying for recognition. The 2000 census listed almost 750,000 people as still unidentified and awaiting recognition, meaning they are regarded as ethnically different but do not fit into any of the recognized categories.

In recognition of the minorities’ official status as well as their strategic importance, various levels of nominally
autonomous administration were created: five regions, thirty-one prefectures, ninety-six counties (or, in Inner Mongolia and Manchuria, banners), and countless villages. Such autonomous areas do not have true local political control, although they may have increased local control over the administration of resources, taxes, family planning, education, legal jurisdiction, and religious expression. These areas have minority government leaders, but the real source of power is still the Han-dominated Communist Party. As a result, they may actually come under closer scrutiny than other provinces with large minority populations, such as Gansu, Qinghai, and Sichuan, which are home to the Hui, Tibetan, and Yi minorities. While autonomy seems not to be all the word might imply, it is still apparently a desirable attainment for minorities in China.

Between the 1982 and 1990 censuses, eighteen new autonomous counties were established, three of them in Liaoning Province for the Manchus, who previously had no autonomous administrative districts. Although the government is clearly trying to limit the recognition of new nationalities, there seems to be an avalanche of new autonomous administrative districts. Besides the eighteen new counties and many villages whose total numbers have never been published, at least eight more new autonomous counties are to be set up. Five will go to the Tujia, a group widely dispersed throughout the southwest that doubled in population from 2.8 to 5.8 million from 1982 to 1990.

The increase in the number of groups seeking minority status reflects what may be described as an explosion of ethnicity in contemporary China. It has become popular, especially in Beijing, for people to reveal themselves as Manchus or other ethnic groups, admitting they were not Han all along. While the Han population grew 10 percent between 1982 and 1990, the minority population grew 35 percent overall, from 67 million to 91 million, and another 10 percent in the year 2000, to 104 million. The Manchus, a group long thought to have been assimilated into the Han majority, added three autonomous districts and increased their population by 128 percent from 4.3 to 10.6 million, while the population of the Gelao people in Guizhou shot up from just 53,000 in 1982 to over 579,000 in just 18 years.

In addition to a high birth rate, these figures also indicate category shifting, as people redefine their nationality from Han to a minority or from one minority to another. In interethnic marriages, parents can decide the nationality of their children, and the children themselves can choose their nationality at age eighteen. One scholar predicted that if the minority populations’ growth rate continues, they will total 100 million in the year 2,000 and 864 million in 2080.

**RISING ETHNIC AWARENESS**

By the mid-1980s, those groups identified as official minorities were beginning to receive real benefits from the implementation of several affirmative action programs. The most significant privileges included permission to have more children (except in urban areas, minorities are generally not bound by the one-child policy), pay fewer taxes, obtain better (albeit Chinese) education for their children, have greater access to public office, speak and learn their native languages, worship and practice their religion (often including practices such as shamanism, which are still banned among the Han), and express their cultural differences through the arts and popular culture.

In recent years various minority and ethnic groups have begun to rediscover and reassert their different cultures, languages, and history. The official minorities in China have begun to assert their identities more strongly, pressing the government for more recognition, autonomy, and special privileges. In addition, within the Han majority, groups have begun to rediscover, reinvent, and reassert their ethnic differences.

Rising self-awareness among the Cantonese is paralleled by the reassertion of identity among the Hakka, the southern Fujianese Min, the Swatow, and other peoples. Most of these southern groups traditionally regarded themselves not as Han but as Tang people, descendants of the great Tang dynasty (618–907 CE) and its southern bases. Most Chinatowns in North America, Europe, and Southeast Asia are inhabited by descendants of Chinese immigrants from the mainly Tang areas of southern China and built around tang ren jie (Tang person streets).

There is also a newfound interest in the ancient southern Chu kingdom as a key to modern southern success. Some southern scholars have departed from the traditional Chinese view of history and argue that, by the sixth
century BCE, the bronze culture of the Chu spread north and influenced the development of Chinese civilization, rather than this culture originating in the north and spreading southward. Many southerners now see Chu as essential to Chinese culture, to be distinguished from the less important northern dynasties, with implications for the nation’s economic and geopolitical future. Museums to the glory of Chu have been established throughout southern China. There is also a growing belief that northerners and southerners had separate racial origins based on different histories and contrasting physiogenetic types, a belief influenced by nineteenth-century notions of race and Social Darwinism.

There has also been an outpouring of interest in Hakka origins, language, and culture on Taiwan, which may be spreading to the mainland. The Hakka, or guest people, are thought to have moved southward in successive migrations from northern China as early as the Eastern Jin (317–420 CE) or the late Song dynasty (960–1279), according to many Hakka, who claim to be Song people as well as Tang people. The Hakka have the same language and many of the same cultural practices as the She minority but never sought minority status themselves, perhaps because of a desire to overcome their long-term stigmatization by Cantonese and other southerners as uncivilized barbarians. This low status may stem from the unique Hakka language (which is unintelligible to other southerners), the isolated and walled Hakka living compounds, or the refusal of Hakka women during the imperial period to bind their feet. The popular press in China is beginning to note more frequently the widely perceived Hakka origins of important political figures, which include Deng Xiaoping, Mao Zedong, Sun Yat-sen, former party general secretary Hu Yaobang, and former president Ye Jianying. People often praise Zhou Enlai by stressing his Jiangnan linkages and Lee Kuan-yew as a prominent Hakka statesman.

One might say it has become popular to be ethnic in today’s China. Mongolian hot pot, Muslim noodle, and Korean barbecue restaurants proliferate in every city. Minority clothing, artistic motifs, and cultural styles adorn Chinese bodies and private homes. In Beijing, one of the most popular new restaurants is the Thai Family Village (Dai Jia Cun). It offers a cultural experience of the Thai minority (known in China as the Dai), complete with beautiful waitresses in revealing Dai-style sarongs and short tops, sensually singing and dancing while exotic foods such as snake’s blood are enjoyed by the young Han nouveau riche.

Awareness of China’s ethnic groups has spread beyond its borders. Foreign policy considerations argue for better treatment of Korean minorities because South Korean investment, tourism, and natural resources have given China’s Koreans in Liaoning and Manchuria a booming economy and the best educational level of all nationalities, including the Han. International tourism to minority areas has been on the rise, including the Silk Roads tourism to Xinjiang and the marketing of package tours to the colorful minority regions of Yunnan and Guizhou for Japanese, Taiwanese, and Southeast Asian Chinese tour groups. Hmong tourists from the United States have begun to visit Miao (Hmong) areas in Guizhou, Yunnan, and Guangxi in increasing numbers, creating linkages to their early ancestral origins that link China, Vietnam, and now the United States together.

Since the 2008 Olympics in Beijing, China has become more exposed to the outside world, and yet the complexity of its cultural and ethnic diversity is still difficult to grasp. Although China’s official ethnic populations are still relatively small in number, increasing globalization has not only meant greater awareness of these heretofore rather isolated populations, but also contributed to further communication with the outside world. While China’s extraordinary economic growth and promotion of tourism in minority areas has assisted economic development in many minority areas, it has also hastened the loss of many ethnic traditions that had been preserved for generations largely through isolation. Appreciation of the tremendous contributions that China’s many ethnic communities, both official and unofficial, have made to China rich multicultural heritage is critical if the many peoples of the People’s Republic are going to fully participate in building a strong and prosperous future.

Eunuchs
Tàijǐān 太监
Huànguān 宦官

Often at odds with Confucian officialdom, eunuchs were castrated male servants employed in the imperial household. The emperors, especially those who were mistrustful of their Confucian officials, relied on veritable armies of eunuchs (at one point numbering up to 100,000) for many critical decisions, appointing them to positions of high authority. The last known eunuch died in Beijing in 1996.

Eunuchs (taijian or huanguan) were castrated male servants employed in the imperial household from the Shang dynasty (1766–1045 BCE) through the Qing dynasty (1644–1912). As individuals, eunuchs were charged with various responsibilities, such as guarding gates and attending to the personal care of the emperor, his harem, and the imperial relatives. As an institution, eunuchs collectively functioned as an imperial structure in the inner court alongside the officialdom in the outer court, and during certain periods emperors relied on eunuchs for critical decision making and appointed them as army supervisors, tax collectors, military commanders, special commissioners, and other positions whose authority rivaled that of the officialdom.

As individuals and as an imperial structure eunuchs held a fluctuating level of political and military powers through special intimacy with the emperor, princes, and palace women. The Confucian officials in the outer court often targeted them as enemies, but the institution of eunuchs survived massacres and the change of dynasties until the last century. In 1912 the constitution of the Republic of China banned castration, but a small number of boys continued to undergo the procedure. Sun Yaoting, the last known eunuch, died in Beijing on 17 December 1996 at the age of ninety-four.

Political History

The primary sources on eunuchs are the biographies of mostly notorious eunuchs included in the standard histories of each dynasty, which contain the Confucian historians’ vitriolic commentaries on eunuchs as scoundrels who overstepped their original role as menial servants. Except for Later Liang (907–922) and Tangut Xi Xia (1038–1227), all dynasties had eunuchs serving in the palaces as servants and intermediaries between the emperor and the officialdom. Eunuchs in the indigenous dynasties, Han (206 BCE–220 CE), Tang (618–907 CE), and Ming (1368–1644), were most destructive and were blamed for the fall of these dynasties. Even when large numbers of eunuchs were evicted from the palaces and massacred by the thousands in 189 CE and 890 CE, the survivors were soon recalled and new recruits brought into the palaces. In the Han and Tang dynasties many eunuchs acquired offices, became estate owners, and terrorized the populace, interfering in court and military affairs to the point of usurping the operative powers of the bureaucracy and dethroning and enthroning emperors. The number of eunuchs varied...
from several dozen in short-lived dynasties to 100,000 in
the Ming dynasty, during which the emperors, who dis-
trusted the Confucian officialdom, entrusted eunuchs to
lead major military and diplomatic campaigns.

Foreign peoples who founded dynasties on Chi-
nese territory did not have eunuchs during their no-
madic stages, but they adopted this Chinese institution
as part of the state-forming and sinicization process
when they set up these dynasties—the Tabgach Northern
Wei (386–534 CE), Khitan Liao (907–1125), Jurchen
Jin (1125–1234), Mongol Yuan (1279–1368), and Manchu
Qing (1644–1912). The Northern Wei eunuchs gained as
much power as their counterparts in the indigenous dy-
nasties, but eunuchs in the Liao, Jin, and Yuan periods
were relatively insignificant. In the Qing dynasty some
eunuchs were manipulative, but they did not have the
institutionalized political and military powers associated
with the eunuchs of the earlier periods, as in the cases of
Zhao Gao (d. 207 BCE) and Wei Zhongxian (1568–1620).
Zhao Gao held an iron grip on the Second Generation
emperor of the Qin dynasty (reigned 209–207 BCE) after
removing his rival and silencing the officialdom. Simi-
larly, in the Ming dynasty Wei Zhongxian tyrannized
the officialdom and population and created a cabal of
corrupt eunuch and non-eunuch officials who flattered
him by setting up more than forty shrines to worship
him as a living god.

Social History

Literary works supplement traditional historical sources
in constructing a social history of the eunuchs. The mak-
ing of eunuchs involved removing the male reproductive
organs, a procedure described as either coerced or vol-
untary castration. Coerced castration provided the main
supply of eunuchs until the seventh century, during which
castration was the punishment meted out to criminals,
with a severity second only to execution. Castration was
forced on prisoners of war in the Shang dynasty and on
male children and relatives of political criminals in the
Northern Wei. Provincial tributes to the central govern-
ment often included a quota of castrated boys who had
been captured for that purpose.

In voluntary castration a boy had himself castrated
in order to be eligible for eunuch recruitment into the

HY INITIATIVE.
palaces (as Wei Zhongxian did). Poverty-stricken parents who “volunteered” their young boys for castration actually coerced them to undergo the procedure, hoping that they would be recruited into the palaces and supplement the family income.

With only several exceptions, the eunuchs through the dynasties were healthy males before castration, and after the procedure they retained their male gender identity and sexuality. They married palace women and adopted both eunuchs and non-eunuchs who perpetuated their lineage. Despite the eunuchs’ marriage and adoption practices, the Confucian society that valued biological heirs and social standing still treated eunuchs with contempt, berating them for being unfilial and immoral. Eunuchs suffered a lifetime of physical torture from emperors, palace women, and senior eunuchs, who beat them to death for minor violations. Indeed, the majority of the eunuchs in the standard histories were executed for court intrigues or alleged crimes of murder and corruption.

In this culture of sanctioned violence were rare cases of eunuchs who escaped the historian’s negative appraisal. Cai Lun (50–121 CE) is praised as the inventor of the paper-making process; he was falsely accused and executed on trumped-up charges. Zheng He (1371–1433) is acclaimed as an admiral who led seven maritime voyages across the oceans, reaching the east coast of Africa. Born in a Muslim community in Kunming, Yunnan Province, he was captured and castrated as a young boy and taken to Nanjing and Beijing, thousands of miles from his family and culture.

The eunuch institution has been seen as an icon of the Chinese imperial system from which East Asian civilizations borrowed. Confucianism and eunuchs both became entrenched in premodern Korea and Vietnam, which even exported eunuchs to Yuan and Ming China. It is interesting to note that Japan adopted Confucianism but rejected the practice of eunuchs.

Examinations, Imperial

Kejū 科举

The term bureaucrat did not always have the same pejorative attachment it has today. Before the twentieth century, China was administered by highly respected, and thoroughly tested, professional bureaucrats, or civil servants.

China was the first civilization to develop a civil service recruited on the basis of merit, not birth. This led to the development of a meritocracy (social esteem and position based on learning) millennia earlier than any other civilization. This system was reported in glowing and admiring terms by Jesuit missionaries who came to China in the seventeenth century. It was later copied by European nations. Thus the recruitment of a civil service based on learning and tested through the civil service examinations was one of the glories of the Chinese civilization.

Foundations

The notion of a professional bureaucracy based on merit rather than birth began late in the Zhou dynasty (1045–256 BCE) during the Warring States era (770–221 BCE). Its adoption by the Qin state contributed to Qin triumph in 221 BCE. The succeeding Han dynasty (206 BCE–220 CE) adapted the practice and combined recommendation, testing, and performance rating to recruit a civil service. These practices persisted until the early twentieth century. But it was the reunified Sui (581–618 CE) and Tang empires (618–907 CE) that made civil service examinations a full-fledged system.

Tang Contributions

Like the Han before it, the Tang government established two state universities, one at Chang’ān, the principal capital city, the other at Luoyang, the auxiliary capital. The universities admitted mainly sons of the nobility and bureaucracy, and prepared them for the doctoral exams held at the capital. But men educated in private academies and recommended by local officials after preliminary screening exams could also participate in these prestigious exams. Five types of exams were administered, two of them, for literary composition and for knowledge of the classics, were the most prestigious. Those who passed were called presented scholars, a degree equivalent to the modern doctorate. The remaining three exams—for law, mathematics, and calligraphy—were less esteemed.

The exams were initially administered by the Ministry of Personnel because many of the passing candidates became government officials. After 736 CE, the Ministry of Rites became responsible for administering the exams, making them a ritual of the Confucian state and adding to their prestige. Men who passed the doctoral exams underwent further testing on their practical skills, appearance, and speaking abilities and had their personal files checked for moral uprightness. Only then were they eligible for suitable appointments when vacancies occurred. Appointments were made in the name of the emperor. Civil service positions and civil servants were ranked by nine grades, with ascending salaries as one rose on the bureaucratic ladder. All civil servants were subject to annual ratings by their superiors.
Song Refinements

The greater egalitarianism of Song dynasty (960–1279) society was reflected in the opening of the examination system and the civil service to men of more varied social backgrounds. With a printing press in operation, books became cheaper and more widely available. Objective procedures were also adopted, for example, having three examiners read each paper and having a piece of paper pasted over the candidate’s name to prevent favoritism. Men who passed the metropolitan exams then underwent a palace exam presided over by the emperor, in theory, to confirm the results. Other innovations the Song government undertook were to give the exams every three years and to narrow the scope of the exams to literary composition and interpreting the classics. About two hundred men received the doctoral degree annually during the Song dynasty. These men filled about half of the top government positions. Lower government posts were increasingly filled by the prefectural graduates.

Ming and Qing Bureaucracy

During the nomadic Liao, Jurchen Jin, and Yuan dynasties (916–1368) rulers relied on ethnic minorities and military force to rule China. Although they were compelled to institute the examinations to recruit officials to rule the Chinese, the Chinese so recruited had only limited career opportunities open to them and served only in subordinate positions.

The Ming (1368–1644) government sponsored the most extensive educational system in premodern China. The state sponsored at least one school in every county and prefectural city with a quota of state-supported students. Beginning in 1370 the Ming government held regular exams so that by the 1400s degree holders again dominated the bureaucratic elite. There was a great increase in enrollment in both private academies and family schools during the prosperous Ming and Qing (1644–1912) dynasties, which produced an ever-increasing number of educated men. Neo-Confucianism of the Zhu Xi School had become orthodox around the end of the Song, and this was...
the basis of the school curriculum and the exams. Students were taught to write their essays according to a standard form that organized them in an eight-part structure. This form became known as the Eight-Legged Essay.

Triennial examinations at three levels became the rule. Aspiring young men first had to pass the county-level exams. Those who did earned the cultivated talent degree, equivalent to a bachelor of arts degree in modern terms. This entitled them to wear a designating sash, exempted them from unpaid labor owed to the emperor (corvee), and made them eligible to teach in minor government posts. They could also take the three-day-long provincial examinations on the classics and history, in which they had to be able to relate philosophical principles to current political issues. Those who passed became elevated men, equivalent to master of arts degree. They were eligible to enter government service, teach, or compete in the metropolitan exams held at the capital. About 1,200 men received this degree triennially in early Ming times; the figure had risen to approximately 1,800 by mid-Qing. Those who passed the difficult metropolitan exams took a final palace exam that ranked them in order of excellence. They were called presented scholars, or doctors. These men became national celebrities equivalent to modern sports heroes. Many entered the civil service, starting at relatively high positions.

The Ming government also set a geographic quota for the number of passing doctoral candidates: 35 percent was reserved for northerners, 10 percent for westerners (mainly for candidates from Sichuan), and 55 percent for southerners. The Qing refined the quota on a provincial basis. The quota system was aimed at producing a bureaucracy that was nationally based. Without a quota southerners would have dominated because since the Song dynasty, southern China had become economically more prosperous than the north and, as a result, had better schools that produced better prepared students.

The Qing government founded by the Manchus, an ethnic minority from northeastern China, did not discriminate against the Han Chinese to nearly the same degree as previous nomadic dynasties had. The Qing bureaucracy relied almost entirely on the examination system for its recruits. Sinicized Manchus took the exams as everyone else did. However, at the metropolitan, or presented-scholar, level, a special and easier exam was also scheduled for the Manchu, Mongol, and Han bannermen. The rise of the Manchus was due to a military organization called the banner system, which enrolled Manchus, Mongols, and Han Chinese who joined the Manchu cause prior to 1644 into separate, elite hereditary military units. Although Manchu, Mongol, and Han Chinese bannermen were eligible to take an easier exam, many Chinese chose not to do so because the more easily earned degrees were perceived as less prestigious.

The personnel administration practices established by the Tang continued during the later dynasties. They included annual merit ratings, triennial appointments, reappointments that could extend a term for up to nine years in a single post, the principle of seniority, and the law of avoidance, which precluded any man from serving in his home province.

The traditional exam system lasted until the early twentieth century. The exams became less relevant in the late nineteenth century as China struggled to adapt to the modern world. Modern schools, introduced by Chinese missionaries, began teaching the sciences, foreign languages, and world history, and were followed by Chinese public and private schools and universities that adopted modern, Western curricula. The exam system was abolished in the last years of the Qing dynasty. Schools for girls proliferated after the establishment of the Republic in 1911. Universities became coeducational after 1920.

Exploration by sea started the process of globalization in the early modern era of world history. The best-recorded case of Chinese maritime exploration was that of Admiral Zheng He during the Ming dynasty (1368–1644). By the mid-fifteenth century the Chinese were among the most knowledgeable, best-equipped, and widest-traveled sailors in the world.

Although seafaring Western explorers have received much attention for their travels, the Chinese were also active in maritime exploration. (Because China as an empire either absorbed already established settlement regions or sent soldiers to its frontiers to settle them, little, if any, overland “exploration” per se occurred.) Chinese explorations at sea reached their peak under Admiral Zheng He (1371–1433) in the mid-fifteenth century and show, by their sheer scale, China’s organizational skills and accomplishments in the maritime sector.

Two pages from the I Yu Thu Chih (Illustrated Record of Strange Countries) circa 1430, attributed to Chu Chuan, a prince of the Ming dynasty, and likely influenced by the knowledge gained from the expeditions of Cheng Ho. Zebras and denizens of Muslim culture are among the “exotic” sights such explorers encountered.
Resource Endowment and Early Achievements

A land-based nation, China nonetheless is surrounded by four seas—the Bo Hai, the Yellow Sea, the East China Sea, and the South China Sea—which link China to the Pacific and Indian Oceans. Favorable conditions for sailing from mainland China occur in terms of the climatic patterns, sea and ocean currents, tidal patterns, and inland transportation to the coast.

China’s maritime activities underwent a long evolution. Although scholars have debated when and how Chinese maritime exploration began and how much Chinese sailors achieved in their premodern era (ending around 1840), the extent of China’s maritime undertakings can be understood by examining the three types of sea routes that Chinese sailors used: local short-range routes along China’s own coast; medium-range routes to East Asia, South Asia, and Southeast Asia; and long-range routes to West Asia and East Africa.

By the western Han dynasty period (206 BCE–8 CE) Chinese ships reached Simhala (now Sri Lanka). In the eastern Han dynasty period (25–220 CE) Chinese ships went beyond Sri Lanka to reach destinations in West Asia. In 97 CE Gan Ying, the Chinese envoy to the Roman Empire, went as far as the edge of the Persian Gulf. From the Tang dynasty (618–907 CE) onward, some of these sea routes were frequently used by the Chinese, the Indians, and Arabs; they formed the so-called Silk Routes (as compared with the overland Silk Roads).

Maritime Growth during and after the Song Economic Revolution

By the tenth century most of the sea routes used by the Chinese followed coastlines. Major maritime progress was made during the Song dynasty (960–1279), when China experienced its medieval economic revolution. For the first time Chinese ships were able to cross some 2,300 kilometers of open waters in the Indian Ocean from Malacca to Sri Lanka, avoiding the coastal detour in the Bay of Bengal. They even sailed from Sri Lanka to Ghubbat al Qamar, an inlet of the Arabian Sea on the Arabian Peninsula, across another 4,000 kilometers of ocean. This was a huge leap in Chinese maritime advancement.

With ongoing incremental improvements in technology, the Chinese sailed faster and more accurately. As a result, sea voyages became progressively shorter. During western Han times a trip to the vicinity of Singapore took some 150 days, but the same trip took only 40 days during the Song dynasty. During the Sui dynasty (581–618 CE) and the Tang dynasty, it took more than a month to travel from Sri Lanka to the Persian Gulf, whereas by the Ming dynasty (1368–1644), to cover a similar distance took just twenty or so days.

At the center of the Chinese progress in sailing was improvement in navigation and shipbuilding. Astronomical navigation became well established in China by the end of the ninth century, and it was enhanced during the tenth century by the use of the compass, which led to the stage of partial dead reckoning, that is, navigating in part without reliance on the stars, using measured travel distance and compass positions instead. Later sophisticated seaway compass charts became available among Chinese navigators; these contained information on main landmarks, star elevations at chosen locations in different seasons, travel distances, and compass readings for various sea routes. A good example is Zheng He hanghai tu (Navigation Chart of Zheng He’s Voyages) from the fifteenth century.

In terms of shipbuilding, Chinese technology reached its maturity by the twelfth century with the Fuzhou-type ship (fuchuan), which was used exclusively for sea voyages. Its main features were a ballasted keel and bilge keels together with a low deck length-beam ratio for stability; a V-shaped bottom and multiple sails and jibs (three to twelve as recorded) for speed; multiple stern rudders for steering; and a hull of clinker-arranged planks with multiple holds for a stronger structure. During the same period the versatile “shallow-water ship” (shachuan), commonly known as the “Chinese junk,” was also invented; its distinctive features were a keel-less hull and a U-shaped bottom. The Fuzhou-type was the standard for the Ming fleet.

By the mid-fifteenth century the Chinese were among the most knowledgeable, best-equipped, and widest-traveled sailors in the world, having traveled by 1440 to a total of 153 new places in such geographically disperse...
regions as Southeast Asia, South Asia, the Arabian Sea, the Red Sea, the east African coast, and even the Mediterranean region.

**Ming Voyages: Glory and Outcome**

Undoubtedly the best-recorded case of Chinese exploration was that of Admiral Zheng He. Without Zheng He and his publicized seven voyages to the Indian Ocean, much of Chinese maritime ability and achievements may have been obscured in history, as happened with the Polynesians.

Recruited as a young eunuch to enter the inner circle of the Ming court, Zheng was appointed in his early thirties to command a long oceangoing voyage in 1405 despite the fact that he had no apparent sailing experience. Zheng’s constant sailing for the next three decades (until 1433) apparently served for the Ming court the purpose of keeping him away from state politics—a dignified way to achieve his exile after his involvement in a court coup. In this context an element of sailing for the sake of sailing was associated with Zheng’s journeys, all of which resulted in economic losses for the Ming dynasty. Nor did Zheng He’s voyages lead to greater prosperity in foreign trade, which might have let the court recoup the cost of the voyages.

In reality, the sole purpose of the ill-defined voyages was as a public relations campaign to win friends for China overseas. Indeed, Zheng and his men behaved like philanthropists, distributing gifts wherever they went. Even so, the actual effectiveness of the campaign remains highly questionable. The number of countries that paid tribute to the Ming court increased little during and after Zheng’s voyages. The main evidence that “international peace” was promoted by Zheng’s visits comes from the fact that Zheng set up four regular stopovers in Champa (in present-day southern Vietnam), Sumatra, Sri Lanka, and Guli (Calicut in present-day India) instead of turning these places into China’s colonies.

Spectacular as his voyages were, these multiple-legged trips were by no means unprecedented in Chinese diplomacy: Twelve centuries earlier, during the Three Kingdoms period (220–265 CE), Sun Quan, the king of Wu, sent Zhu Ying and Kang Tai overseas for a twenty-year-long diplomatic mission, during which time they visited Southeast Asia, the South Asian subcontinent, and the Arabian Sea region. Similar efforts were made during Yuan dynasty rule (1279–1368). And Zheng He was not alone in his adventuring during the Ming dynasty: Another navigator, Shi Jinqing (?–1421), toured Asia as imperial commissioner, traveling at least as far as Sumatra, Java, and Japan.

Because of the unclear motives, extravagant nature, and doubtful impact of Zheng’s voyages, the Confucian literati during the Ming dynasty did their best to ignore them. Zheng’s records survived only in the hands of his closest aides, Ma Huan and Fei Xin, in the form of travelogues entitled *Yingya shenglan* (Tours to Great Sites Overseas) and *Xingcha shenglan* (Voyages on Heavenly Rafts), written in 1451 and 1460, respectively. Since then most of Zheng’s findings have remained unknown to the large majority of the Chinese population.

However, the sheer scale of Zheng’s operation shows China’s organizational skills and accomplishments in the maritime sector: As many as 208 vessels and 28,640 marines were involved in a single voyage, taking multiple sea routes simultaneously with detachments in order to maximize geographic coverage. Scholars have suggested that Zheng’s detachments may have visited even Australia and part of North America across the Atlantic Ocean.

In the end, Zheng’s voyages proved to be unsustainable. Cool-headed cost-benefit calculation finally prevailed among Confucian decision makers, and such wasteful voyages were never undertaken again. Chinese sailors during the Qing dynasty (1644–1912) were content to remain within the China seas. In a twist of historical fate, this made Zheng a legend and his journeys the pinnacle of Chinese maritime history; Zheng achieved a worldwide record that was broken only by Europeans with different political and economic institutions and agendas, as seen from the activities of Christopher Columbus and Vasco da Gama.

**Historical Perspective**

China’s achievements in exploration over the long run (from the beginning of the Han dynasty in 206 BCE until the end of Zheng’s journeys in 1433 CE) were significant by premodern standards. However, as in many other areas, the Chinese were ruthlessly surpassed by the post-
Renaissance Europeans, who enjoyed the fruit of the science revolution, the military revolution, and, finally, the Industrial Revolution. All these revolutions took place after Zheng’s era.

Ironically, during the late nineteenth century when Chinese took to the sea again in large numbers, they were no longer accomplished mariners on showy Chinese treasure ships. Rather, they were helpless coolie laborers on foreign ships on the way to sell their cheap labor to the West, showing just how poor and weak China became after Zheng’s time.

Hè lì jī qún
The United States controls exports with China to mitigate trade, address security concerns, and communicate foreign policy. The Export Administration works within the U.S. Department of Commerce; its function is legislated by Congress. A globalized world economy, the magnitude of China’s manufacturing production, and China’s role as both an import and export partner makes this complex business relationship one of the most important of our time.

Control of exports from the United States helps to limit China’s access to products and technologies that can be used for military purposes. But export controls also restrict American businesses from competing fully in the global marketplace.

In 2007 the White House revived a push for a renewal of the Export Administration Act (EAA). The EAA regulates the export and re-export of many commercial goods and most goods that have both commercial and military applications, known as dual-use items. China is one of the main targets of this legislation not only because China’s military continues to grow and modernize but also because of the Chinese government’s willingness to trade with nations the United States finds objectionable. China is described as one of the major players in cloak-and-dagger black-market efforts to take highly sensitive U.S. technology and trade it or share it with such nations as Russia, Pakistan, North Korea, and certain countries in Africa.

Export Control Laws

The United States government considers export control laws a vital tool to strengthen national security. Even though the EAA lapsed in 2001, it has been renewed in large part by executive order since then. In April 2007 new legislation was introduced to renew the EAA in its entirety.

Export control laws, first enacted in 1979, give the U.S. Department of Commerce authority to control so-called dual-use items, products that could have military as well as civilian applications. But this causes a problem. With the growing globalization of the economy, business and trade groups do not want to see money-making possibilities hampered by restrictions on what they can and cannot ship to one of the world’s most important markets. At their most extreme, export controls ban certain transactions with certain foreign countries; at the very least, they require proof and certification that advanced or sensitive items shipped overseas will stay in the hands of the person or entity they are sent to.

Trade versus Security

In 2002 Vann H. Van Diepen, then acting deputy assistant secretary of state for nonproliferation control, said that China was the focus of U.S. export control policy because of its growing regional military power and because
certain Chinese entities had been involved in military proliferation. He acknowledged, however, that because of the size of China’s market, there was a need for balance. Companies generally accept and understand the restrictions on trading actual munitions and armaments to foreign countries that are not allied with the United States, but there have been disagreements over dual-use items and technologies.

Standards are in place to try to determine whether an item can be controlled, including whether it is available on the mass market and from a friendly foreign country and if the sale of the item would pose a national security threat to the United States. For example, a bullet is always a weapon. But a computer could be a necessary component in a missile system and, at the same time, have a definite civilian purpose. In deciding what to do about the export of computers, the U.S. government established how many millions of theoretical operations per second (MTOPS) a computer would have to perform to qualify as a high-performance computer. Those are the computers whose sales the government regulates because only computers of that caliber are useful in a missile system. But it is increasingly difficult for the government’s regulations to keep pace with improvements in computer performance.

Policymakers have difficulty reaching consensus on dual-use items. Some support less restrictive measures that would allow the export of many technologies and would ban only those that could easily be used for military purposes. Others would ban export of any item that could have any function militarily, a category that includes items as various as trucks and vans that could be used as personnel transports and metal fittings that might possibly be used in military equipment. For example, machine tools such as lathes are subject to export restrictions because they are critical to the production of missiles. But not allowing U.S. companies to sell these machines to China cuts U.S. companies off from a huge market of Chinese manufacturers who could also use these dual-use items to create nonmilitary products.

In addition to their concerns over being excluded from China’s lucrative market, U.S. firms are also concerned about possible confusion over legislated constraints if new export controls increase rapidly. They fear that eventually the system of controls will become so complex that businesses will not be able to determine whether a transaction is above board.

Since 2001

When China joined the World Trade Organization (WTO) in December 2001, the gates were opened for an immense flow of trade between China and the rest of the world. This was a positive development for the United

China’s export-driven economy feels the pain of a global recession during the holiday season. The magnitude of China’s manufactured goods, and China’s role as both an import and export partner of the United States, makes the business relationship between the two countries especially complex. PHOTO BY ROBERT EATON.
States because, in becoming a member of the WTO, China accepted standard international trading regulations. At the same time, it meant that the United States had to compete with the rest of the world for a share of the Chinese market. Competition means that any trade restrictions pose both favorable and unfavorable consequences.

In a May 2005 update of The Export Administration Act: Evolution, Provisions, and Debate, a Congressional Research Service (CRS) report, the CRS described the challenge of controlling exports in a globalized world economy and suggested that export controls are not the best option. The report stated that unilateral export controls were becoming increasingly unworkable in a global economy. The report further noted that earlier export controls were based on products being manufactured or assembled in one country, but now goods are often manufactured and assembled in several countries.

Another challenge to unilateral export controls is the mass-market provision of the EAA. A product can be regulated as a dual-use item only if it is not available on the mass market or from a foreign country that does legitimate business. These provisions limiting the applicability of dual-use regulations were designed to help keep U.S. companies competitive by allowing them to trade in any product that is available from another country and by limiting the U.S. government’s ability to keep U.S. companies out of markets. But in practice, according to the CRS, those provisions are not sufficient to offset the competitive handicap that the EAA regulations force U.S. companies to operate under. The challenge to U.S. competitiveness comes from the complexity of the controls; from the arduous process of seeking licenses, approvals, and permits for exports of potentially sensitive items; and from the length of time involved in updating restrictions.

An example of the complexity of export controls comes from 1998 and 1999, when President Bill Clinton was pushing for an update to the MTOPS standard for controls on high-performance computers. A higher MTOPS standard, which would take into account advances in the computing abilities of general-use computers, would, theoretically, have allowed more machines to avoid being classified as high-performance computers and, therefore, would have allowed them to avoid being subject to dual-use regulation. But computer trade groups testified that the change would not have allowed U.S. companies to keep pace with foreign suppliers, who, unhindered by similar legislation in their home countries, could offer more powerful general-use computers on the world market.

Although the EAA expired in 2001, President George W. Bush maintained much of the export control legislation by executive order during his time in office. The International Emergency Economic Powers Act (IEEPA) gave the president the authority to declare something originating in a foreign country an unusual and extraordinary threat to the nation’s security, foreign policy, or economy and to deal with that threat through blocking transactions and freezing assets. IEEPA penalties are not as strong as EAA penalties, however. The Export Enforcement Act of 2007, a bill to extend the EAA for five years, was introduced in the U.S. Senate in 2007. The proposed legislation would have increased penalties for export control violations and would have expanded the authority of the Department of Commerce to investigate potential violations of EAA overseas. No further action was taken on the bill in the 110th Congress. Should the bill come up for consideration in the future, the battle is sure to be fierce with supporters of the EAA worried about national security and opponents worried about the economic well-being of U.S. companies.

Extraterritoriality ▶
Extraterritoriality, the principle that allows foreigners to be governed by the laws of their own land, was prevalent in China during the nineteenth and early twentieth century. Although the principle needed clarification through several treaties, both the Qing dynasty and the foreign countries with a presence in China kept the practice in place until the Nationalists came into power in 1927.

Extraterritoriality was the principle by which foreigners in China were governed by the laws of their own country, as enforced by their consuls, rather than by Chinese law. In the early nineteenth century Britain was reluctant to allow its subjects to be tried or punished under Chinese law (which allowed judicial torture), and exemption from Chinese justice was one of the British goals in fighting the First Opium War (1839–1842). Extraterritoriality was first included in the 1843 Supplementary Treaty of the Bogue between China and Britain and then expanded to other foreign powers in later treaties.

For both the Qing dynasty (1644–1912) and foreigners extraterritoriality was a familiar way of dealing with different legal systems. Europeans in the Ottoman Empire had long enjoyed immunity from Ottoman law under the Capitulations—a series of agreements that governed the treatment of foreigners in the Ottoman Empire. Chinese governments had a long history of encouraging foreign merchants in China to govern their own affairs, and treaties with the Russians had granted mutual extraterritoriality since the Treaty of Nerchinsk in 1689. Extraterritoriality was at first fairly uncontroversial, and later treaties expanded and clarified how it was to work.

But the Chinese became increasingly unhappy with extraterritoriality and the treaty system in general as nationalist sentiment grew in the twentieth century. Foreigners had worked to expand the authority of the Mixed Court, which handled cases involving both Chinese and foreigners, since its establishment, and after the 1911 revolution it became effectively autonomous. At the same time Chinese popular opinion was demanding the end of foreign privileges. After the Russian Revolution the new Soviet government renounced its treaty rights as a way of winning support in China.

Treaty revision, changing the basis of China’s relationship with foreign powers, was a major part of China’s diplomacy in the first part of the twentieth century. Extraterritoriality was one of the most offensive parts of the treaties for Chinese Nationalists because many Chinese came to see it as part of an assertion of cultural superiority of non-Chinese. Chinese governments made abolition of extraterritoriality one of their main goals in negotiations with foreign powers. Chinese legal reforms were driven in part by a desire to make extraterritoriality seem unnecessary to foreigners. Chinese governments drew attention to the many abuses of extraterritoriality, including Chinese gangsters’ fondness for taking Portuguese citizenship to avoid Chinese law and the widespread smuggling of opium.
and morphine by Japanese and Koreans protected by extraterritoriality.

After 1927 the new Nationalist government rapidly convinced the minor powers to give up extraterritoriality, and many of the smaller foreign concessions were returned. Although negotiations toward the end of extraterritoriality with Britain and the United States made progress, Japan’s unwillingness to relinquish its position made a general settlement impossible. Extraterritoriality was finally abolished in 1943 as part of the wartime alliance between China and the United States.

Descriptions of famine punctuate China’s historical records. Conditions such as drought, flood, or war caused famine conditions, but official response (or lack of it) often exacerbated their severity. Since the late 1970s, death from famine conditions has all but disappeared from China, to be replaced by disorders more akin to those of modern developed nations, such as obesity, diabetes, high blood pressure, and heart disease.

Famine is a result of multiple political, economic, social, and ecological disorders that combine to produce an overwhelming number of deaths from starvation and epidemic disease. An examination of Chinese famines and Chinese official responses to famine conditions reveals universal features that apply to both traditional and modern times. Famine descriptions punctuate China’s historical records, with one survey noting that eighteen hundred famines were recorded between 108 BCE and 1929. Chinese record keepers were careful to document that, in most cases, actual famine conditions did not result directly from drought, flood, war, or neglected infrastructure, but rather from failures of official intervention in the face of widespread distress of the population.

Traditional Relief and Prevention

Famine relief and prevention traditionally formed an inherent part of China’s official responsibility for the welfare of its population. Historical literature describes different episodes of famine and explains direct, indirect,
and long-term measures for dealing with famine conditions. Lists of precipitating events point to differences between so-called heavenly calamities, such as drought or flood, and calamities linked to human causes, such as political ineptitude, rebellion, or war. Scarcities produced by transferring or removing grain from distribution centers and failure to maintain irrigation works, dikes, and transport networks are classified as human causes.

A guiding principle in dealing with famine called for relief efforts to be administered according to circumstances. Local investigators described famine conditions in terms of degrees of hunger or the amount of food available per person during a given period. Immediate, or direct, relief measures included food and cash distributions to halt starvation. Indirect measures included tax relief, seed distributions to restore agricultural productivity, and work-relief projects to repair famine-related damage. Long-term relief measures included plans for water conservancy and programs to help settle famine refugees on unused land. Officials often planned projects ahead of actual needs so that they could be implemented quickly and without controversy.

An examination of Chinese official responses to famine conditions reveals that, overall, relief efforts succeeded best when China had a strong central order to mobilize physical and economic resources on behalf of popular welfare. When the central order was weak, millions were doomed. A hallmark of Chinese famine intervention called for grain storage to protect against the dangers of crop failures. China's “ever normal granaries” served the dual goals of price stabilization and food relief by permitting officials to sell grain at reduced prices and to arrange grain transfers to avert hoarding and price gouging.

Historical data reveal that, by the mid-nineteenth century, the Chinese state could not mobilize resources necessary to carry out effective famine relief and that famine conditions occurred somewhere in China almost every year throughout the first half of the twentieth century.

**Foreign Intervention**

Foreigners in China during the late nineteenth and first half of the twentieth centuries made repeated attempts to provide famine relief, but they confronted a system in decline and their efforts never evolved into coherent programs. Foreign efforts did, however, address issues to confront a variety of relief agents and agencies in China with ways of handling the problem. One was foreign insistence that China needed long-term physical and economic improvements before the constant threat of famine could be eliminated. A second proposed that the necessary improvements be instituted and run by foreign agencies and personnel. A third issue concerned negative reports that discouraged foreign donors and governments from contributing to Chinese official relief efforts.

Chinese officials regularly accepted foreign food and money for short-term relief and, with equal regularity, rejected long-term relief proposals for projects designed to be owned and run by foreigners. Ultimately, foreign relief efforts emulated Chinese trends. They succeeded best when they had strong external political support. They failed when foreign governments determined that conditions for relief were hopeless and resisted supporting agents and agencies operating in China.

**China and the Great Leap Famine**

Establishment of the People’s Republic of China in 1949 brought dramatic improvements in medical care, disease prevention, and agricultural production. For a time it seemed as if official priority given to eliminating famine would bring positive results. Food production and distribution came under strict central controls, and the state gave high priority to increasing food supplies and improving transport networks. But changing state policies produced disaster as outside assistance was halted, agriculture became collectivized, demands for huge quotas could not be met, and limited resources could not be distributed equitably. An estimated 30 million people died of starvation and disease during the Great Leap Famine of 1958–1962. It is now referred to as the worst famine in human history. A consensus holds that it was human made and that it resulted primarily from political failures associated with the Great Leap Forward, Mao’s abortive effort to encourage rural industrialization at the expense of agriculture.

The years following Mao Zedong’s death in 1976 heralded rapid transformations in all sectors of China’s economy, including food security. The specter of famine faded. By the beginning of the twenty-first century, China demonstrated adequate food supply, positive economic
growth, and official policies supporting appropriate responses to both chronic and emergency food needs.

China’s enormous success in ending the threat of famine had a negative side. Twenty-first-century Chinese food consumption patterns began to emulate Western practices. Chinese levels of obesity, diabetes, high blood pressure, and heart disease rose to levels formerly found only in modern developed nations.

Instead of facing the dread issues associated with widespread death from starvation, twenty-first-century Chinese leaders confronted new issues associated with feeding the population, including policy research, public education in nutrition, and official support for programs to combat the causes and effects of obesity.

The founder of several businesses in Republican China (1912–1949), Fan Xudong was one of the first to raise capital and manage local markets by adopting the principles of network capitalism, including the concepts of shareholders, hierarchical management, and cartels.

Fan Xudong was born in Changsha, Hunan Province, in 1883; he was a descendant of the Song dynasty (960–1279) official Fan Zhongyin (989–1052). Fan’s father died when he was six, leaving the family impoverished. Fan and his elder brother Yuanlian, along with Liang Qichao (1873–1929), a major intellectual and political leader of China, were all exiled to Japan in 1901 due to revolutionary activities. While there, with Liang’s financial assistance, Fan studied applied chemistry at Kyoto University. In 1912, after the fall of the corrupt Qing dynasty, which had been in power since 1644, he returned to China and served briefly at the Currency Bureau as an assayer-inspector before being dispatched by the new Nationalist government on a European tour to study salt administration and production that might be used as models for the Chinese.

But the plan for a state-owned salt refinery never materialized because of opposition by revenue farmers and salt works, who held the hereditary privilege to produce, transport, and market salt. In July 1914, Fan founded Jiuda Salt Industries, Ltd. (renamed Jiuda Salt Refining Company in 1936 to reflect the company’s diverse interests) with the support of Liang Qichao and his associates. Despite the obstruction of Zhou Xuexi, the minister of finance, Jiuda prospered with the help of its shareholder network, breaking the revenue farmers’ hold on the salt market in various trade ports in Hunan, Hubei, Anhui, and Jiangxi provinces.

Much of Jiuda’s new capital, however, was diverted to the Pacific Alkali Co., which was founded in 1917 and renamed Yongli Chemical Industries in 1935 to refer to both the Tanggu plant and another plant in Nanjing. The British-based chemical company Brunner Mond, as part of the cartel led by Solvay and ICI, had long held secret the industrial process and dominated the import market of China soda ash (i.e., sodium carbonate, used in baking, laundry detergent, and industries such as glass-making). Fan, in pursuit of China’s self-sufficiency, founded the Yongli Soda Plant with a capital of 400,000 yuan. A set of factory plans was purchased in the United States, although adapting to conditions in Tanggu—and solving the engineering problems encountered after constructing the production facility according to the blueprints—proved daunting. To support the new enterprise, Fan founded the Golden Sea (Huanghai) Research Institute in 1922. But despite 2 million yuan in diverted capital from Jiuda and bank loans, work at the plant stopped in 1924. Fan was forced to sign an agreement in 1925 selling half of the company to Brunner Mond in return for a capital infusion of 1.07 million yuan and technical assistance. The national boycott of British goods later that year, however, a result of British police shooting striking workers in the Shanghai International Concession, allowed both sides to nullify the agreement. Finally, the chemical engineer Hou
Debang of Yongli Chemical Industries returned from the United States with new equipment and ideas, and Yongli began regular production in 1926.

More trouble, however, awaited Fan. A price war broke out with Brunner Mond (now part of the reorganized Imperial Chemical Industries) just as warlords in north China imposed their own levies and forced the shutdown of Jiuda. An attempt by the salt refineries, on and off, from 1926 to 1934 to organize the fast-growing number of salt refineries into a national cartel also failed.

**Not So Golden**

While economic historians have characterized the Nanjing Decade—the ten years under the Nationalist Party rule from 1927 to 1937—as the golden age of the modern Chinese bourgeoisie, Fan’s experience suggests a more complicated story. With his production facilities and social network based in north China, he had a difficult time adjusting to the new regime. In 1928, when the Nationalist government proposed the construction of a state-owned soda ash plant with a production capacity that would supply the country’s needs, Fan Xudong negotiated to convert Yongli into a joint state-and-private enterprise. Nationalist politics and budget realities, however, prevented the state infusion of capital, and the company remained private by placing 2.5 million yuan in bonds to finance its expansion. By 1934, Yongli had surpassed Brunner Mond in sales in China. Similarly, the Nationalist plan for a state-owned ammonium sulfate plant in 1931 attracted a proposal from Imperial Chemical Industries and the German I. G. Farbenindustrie AG; both were leading members of the Convention Internationale de l’Azote, an international cartel controlling the world’s production and sales of nitrogen-fixing chemical fertilizer. To prevent such a vital industry from being controlled by foreigners or the state, Fan mobilized his bank network to issue 15 million yuan in company bonds collateralized against the assets of Yongli Chemical Industries, Ltd. in 1935. The new plant in Nanjing came online in 1937, a testament to Fan’s dedication and skill in navigating between foreign and state capitalism.

World War II, however, forced Fan and his colleagues to evacuate, leaving behind over 30 million yuan in factories and inventory. Arriving in Sichuan in 1938 with only 400,000 yuan in capital and equipment, he vowed to begin anew with a comprehensive plan to industrialize the interior of the country, especially southwestern China, with emphasis on hydroelectric stations, transportation, and construction of plants for steel, soda ash, ammonium sulfate, coke, and synthetic gasoline. A 3 million yuan relocation subsidy from the government and a state-guaranteed 20 million yuan bank loan allowed Fan to keep his core group of engineers busy with the construction of a new soda ash plant in Jianwei, while Jiuda continued production by taking over the site of a model salt refinery at Ziliujing, Sichuan Province. Fan’s relationship with the Nationalist state, however, remained tenuous. Repeatedly the Nationalist government sought to convert its relocation subsidy into Yongli company shares, thus making it the largest single shareholder. Drawing on the support of a handful of friends in government service and as a member of the National Political Council, Fan rebuffed these annexation attempts, twice calling on Generalissimo Chiang Kai-shek in person for his support.

**Overseas Delegate**

Chiang also valued Fan’s support. In late 1944, he appointed Fan as a delegate to the International Business Conference in New York; one item on the conference agenda was how to preserve and promote private enterprise, especially in developing countries. As a staunch advocate of private enterprise in China, Fan Xudong proved a reassuring voice to U.S. officials concerned with the state-run economy that the Nationalist government espoused. Fan also took the opportunity to negotiate with the U.S. Import-Export Bank for a $15 million line of credit to finance the importation of equipment for his ambitious postwar reconstruction plan. Returning to China in June 1945, however, Fan found out belatedly that the Nationalist government would not guarantee the loan. Technocrats and economic planners already had developed their own competing plans for U.S. aid. A frustrated Fan died after a brief illness. He was eulogized by Mao Zedong as one of the four who made major contributions to the industrialization of the country (the other three being Zhang Zhidong for heavy industry, Zhang Jian for light industry, and Lu Zuofu for shipping). Yongli and Jiuda were among the first major privately held industrial
conglomerates to undergo the socialist transformation to becoming state-owned enterprises.

February 28th Incident
Èr Èrbā Shijiàn 二二八事件

A momentous event in Taiwan’s history took place on 28 February 1947 when a demonstration in Taipei spurred Chiang Kai-shek to send troops from the mainland. The ensuing massacre sparked Taiwan’s further resentment of the corrupt governor Chiang had installed in 1945, when Taiwan was returned to China after years of Japanese rule, and marked the beginning of tensions between opposing factions on the island.

The February 28th Incident, known in Taiwan as “2-2-8” (èr èr ba in Chinese), is perhaps one of the most important political events in the history of Taiwan. The incident—a street protest that escalated into a full rebellion, resulting in Guomindang (Chinese Nationalist Party) troops from the Chinese mainland killing thousands of Taiwanese—was a forbidden subject for decades under the authoritarian rule of Chiang Kai-shek and his son Chiang Ching-kuo. Only in 1995 did President Lee Teng-hui finally officially acknowledge this long-festering wound in Taiwan’s history and apologize on behalf of the government.

The incident began in the evening of 27 February 1947 when an angry crowd gathered in front of Taipei’s Police Bureau on Taiping Street. The crowd was upset the manner in which police and Nationalist Party (Guomindang, GMD) officials treated an elderly woman, who reportedly had been roughed up for selling black-market cigarettes, an activity that was illegal but one that was essential for many people to survive in those early years after the end of the Japanese occupation. The ill-trained and panicked police fired what was supposed to be a warning shot at the crowd but ended up striking and killing a bystander. The crowd then became incensed, and the police fled into a nearby sub-station while the crowd grew in size and surrounded the building. When the crowd discovered that the police involved in the initial acts of violence had fled the building through a back door, the crowd grew only angrier. As word spread of violence, more Taiwanese came onto the street to protest.

This incident was the spark that ignited the powder keg of resentment that had been growing on the island ever since Chiang Kai-shek had sent Chen Yi to be the newly appointed governor-general of Taiwan in 1945 after Japan’s defeat and the return of Taiwan to the Republic of China. Chen’s administration had been plagued with accusations of graft, heavy-handedness toward the local population, and even violence. Many of the GMD troops sent to serve under Chen Yi were ill-trained and unprepared to rebuild Taiwan after forty-seven years of Japanese rule. The local populace had been forced to learn Japanese, and some did not speak Mandarin. The Nationalist forces had just finished fighting a bitter war on the mainland with Japan and had witnessed atrocities committed by the Japanese. As a result, some of the GMD forces came to view the Taiwanese as “collaborators” with the Japanese rather than as an occupied people who had adapted to their new rulers in order to survive. Also, Chen Yi’s policies on Taiwan did nothing to alleviate the tension between the GMD troops and the island’s population. Chen took over thousands of Japanese-owned businesses and factories but also private
Taiwanese homes and businesses. A thriving black market emerged. Some impoverished soldiers allegedly broke into private homes and businesses, looting and stealing to supplement their own paltry salaries and poor rations.

**Escalation**

On February 28 the crowds demonstrating in the streets gathered around Governor-General Chen Yi's office, demanding redress and punishment for the police involved in the previous day's violence. Chen Yi called out the military, who fired indiscriminately into the crowds in an effort to disperse them. Although the violent crackdown on the protesters did end the immediate problem, it led to an even greater one—an all-out attempt at insurrection to overthrow Chen Yi and the Guomindang government on Taiwan.

In the weeks after the February 28 Incident rebels took control of many parts of the island. By 4 March many of the rebels had taken over local radio stations as well as the administration of small towns away from the capital. Chen Yi declared martial law and ordered his troops to shoot anyone caught on the streets after curfew.

The rebels were not unified in their demands; some wanted simply to negotiate more equitable treatment from Chen Yi and the new Guomindang government, whereas others wanted to take control of the island for themselves. A small subgroup even wanted to establish Communist control over Taiwan, siding with Chinese Communist Party leader Mao Zedong's forces on the mainland rather than Chiang Kai-shek's Guomindang government.

But by 8 March Chen Yi with his superior armed forces managed to breach the rebel strongholds, and most of the rebel groups were jailed or killed. The subsequent crackdown became known as the start of the period of "White Terror" on Taiwan as the government hunted down suspected rebel "sympathizers." Some of the people arrested might indeed have had ties to the rebels, but others were merely local elites, people who happened to be at the wrong place at the wrong time; others arrested included a disproportionately high number of high school and middle school students because many students had volunteered to serve on temporary police forces in the towns that had been taken over by the rebels.

No one was completely safe from suspicion. Mainland refugees as well as Taiwanese who had lived under Japanese occupation could be arrested, and some locals started killing so-called Mainlanders out of revenge. In fact, many of the original rebels fled to Hong Kong and escaped punishment. They soon split into two main factions: pro-Communist groups (who eventually went to mainland China after Mao's victory in 1949) and pro-independence groups (many of whom fled to Tokyo).

When Chiang Kai-shek arrived on Taiwan, he ordered Chen Yi's execution for mishandling the February 28th Incident. Chen was executed on 18 June 1950.

**Silence Is Broken**

For decades under the rule of the two Chiangs, no mention of the February 28th Incident was allowed in any textbooks, nor was public discussion of the event and its bloody aftermath permitted. After Chiang Ching-kuo's death in 1988, citizen groups formed to formally seek a reversal of the government's policy of silence on the incident.

A 1992 government report on the incident estimated that between eighteen thousand and twenty-eight thousand people were killed. In February 1995 Taiwanese President Lee Teng-hui made a public apology to the Taiwanese people on behalf of the government, and the Legislative Yuan passed a bill to pay compensation to victims' families. A monument was built in Taipei to honor those who had died, and 28 February was made a national memorial day in 1997. Every 28 February a bell is rung in Taipei in honor of the dead, and the president apologizes to their families and descendants.

FEI Xiaotong
Fei Xiaotong, educated at the London School of Economics, was China’s most important anthropologist/sociologist and the author of a prodigious number of books and articles in Chinese. Although during the period of Maoist radicalism he was virulently attacked, in his later years he became one of China’s most popular and prominent intellectuals.

Fei Xiaotong was born to a cultivated family in the lower Yangzi (Chang) River region. After completing a B.A. in sociology and an M.A. in anthropology in Beijing, he earned a Ph.D. under Bronislaw Malinowski at the London School of Economics. His 1938 Ph.D. thesis, published as Peasant Life in China, argued that Chinese villagers had too little land to subsist on agriculture alone; they needed supplemental income from rural industry. As an anthropologist, Fei always directed his work toward improving his subjects’ lives; he said he wanted to be a “plaintiff for the Chinese peasants.” Returning from England in 1938 to a China partly occupied by Japan, Fei went to the wartime intellectual center of Kunming in Yunnan in the far southwest, where he had a university post, students, and a rural research station. While in the United States for a year from 1943 to 1944, Margaret Park Redfield helped him translate three of these Yunnan studies into English as Earthbound China.

But in China Fei is not known for his ethnographies: Peasant Life in China appeared in Chinese only in 1986. Fei’s Chinese fame was as a master of lively and engaging articles, accessible to a broad public, on society and current affairs. Many series of articles were collected into books, of which he published at least sixteen in Chinese in the 1940s, with a readership reaching far beyond the profession to high school students and government clerks. His most popular book, the often reprinted Xiangtu Zhongguo (translated as From the Soil) generalized about rural culture, explaining to urban readers why old rustic patterns functioned. Other books and articles were more somber, stating that cities and towns were parasites bringing economic distress to villages left defenseless by twentieth-century social erosion of human talent from the countryside. Along the way he brought in a good deal of Western social science theory. A year in the United States in 1943-44 resulted in three books, and a later visit to England produced another. In the late 1940s, he wrote regular articles on international relations, thanks to weekly packets of news materials airmailed from friends in England.

The central tragedy of Fei’s life shows all too sadly the vulnerability of intellectual endeavors to political power. The “plaintiff for the Chinese peasants” could hardly avoid the Nationalist government’s failure to address rural poverty. In late 1945, while Fei spoke at a university rally in opposition to the civil war, government troops fired over his head, and he was rumored to be targeted for assassination. Still, Fei was never much interested in Communism, the Soviet Union, or Marxism; his political values were Anglo-American law and democracy. But the Nationalists had made an enemy of Fei, and when the Communists took over his university campus, he chose to stay on, thinking they would use his expertise in modernizing rural China.
For a while Fei’s famous name was useful in legitimizing Communist power, but soon his tone became constricted, and sociology as a subject was abolished. During the "Hundred Flowers" thaw of 1956 and 1957, he began to speak out again and worked to build a party for intellectuals. When the climate suddenly changed in late 1957, Fei was a major target. He stood with bowed head before the National People’s Congress and countless other assemblies to confess his “crimes against the people.” Hundreds of articles attacked him, not a few by colleagues, and many were viciously dishonest. Fei became an outcast, humiliated and isolated. Twenty-three years, which should have been his most productive, were wasted. At the height of the Cultural Revolution, physically attacked by Red Guards and forced to clean toilets, he contemplated suicide.

The next twenty-three years, in sharp contrast, were an astonishing whirlwind of activity. Following President Richard Nixon’s 1972 visit to China, Fei, by then internationally known, received foreign visitors. In 1979, after Mao’s death, he was asked to direct the restoration of Chinese sociology. He was highly visible as the public intellectual with important political posts and contact with policymakers. His name appeared in the newspapers and his round smiling face was seen on television virtually every week in the 1990s. He traveled all over China and wrote about it in a large book with the charming title Travel, Travel, and More Travel. He went abroad and was showered with international honors in the United States, Canada, Europe, Japan, and Australia.

Above all, it was as a writer that Fei flourished in his second life. Virtually all of his old books were republished, and he turned out new books and articles in even greater quantity. Of the fifteen volumes of his Works (1999–2001), over half were new writings from the 1980s and 1990s. Many of the themes were familiar. He repeatedly and forcefully set forth the case for sociology and anthropology if modernization were to succeed in China. He reminisced about his village fieldwork, his studies, and
his teachers. He wrote on rural industrialization, small towns, national minorities, and developing frontier areas. He championed the cause of intellectuals. He discussed his trips abroad, and made some new translations from English to Chinese. He even wrote a small volume of poetry. What was different in all this new writing was political caution; there was no more pushing for democracy as he had done in the 1940s and mid-1950s. Fei had too little time and too much to do in these last decades to risk playing with fire again.

Fei died in Beijing on 24 April 2005; his body was cremated after a ceremony at the Babaoshan Revolutionary Cemetery.

FENG Guifen

Féng Guīfēn 冯桂芬

1809–1874 Chinese intellectual and official

Feng Guifen was a scholar-official of Qing China responsible for launching the Self-Strengthening Movement. Arguing for a comprehensive reform of the country along Western lines, he envisioned the selective adoption of Western ideas as a way to supplement traditional Chinese civilization. Despite the failure of the movement, Feng’s vision was important to succeeding reform movements.

Born to a merchant family in October 1809 in Suzhou, Jiangsu Province, Feng Guifen was determined to become a civil servant of the imperial Qing government. During his study Feng encountered Commissioner Lin Zexu, who resented foreign penetration into China. After several attempts, Feng successfully earned the Jinshi degree (a rank in the imperial civil service) and joined the Hanlin Academy in 1840. In 1850 Feng went to Yangzhou to revise and enforce the salt law. Meanwhile, Feng wrote a number of works urging tax relief for the masses.

In 1853 Feng was transferred back to his native province to assist the anti-Taiping resistance, where he met Li Hongzhang. Feng remained in Jiangsu, during which time he wrote numerous manuscripts, later compiled as Jiaobinlu Kangyi (Protest from the Jiaobin Studio), arguing for self-strengthening to defend against domestic and foreign enemies. Feng’s works attracted the attention of Li in Beijing.

Under Li’s lead the Qing government launched the Self-Strengthening Movement in 1861, which ended in 1895. Li recruited Feng for assistance and advice. Some of Feng’s measures were adopted, and some were left aside. Following Feng’s advice to acquire Western knowledge, a number of Tongwenguan, academies focusing on Western publications, were established, and Feng was charged to run the Shanghai branch, which opened in 1863. To strengthen the nation’s wealth and power, Li adopted Feng’s proposals to develop the Chinese economy and to manufacture modern weaponry along Western lines. Learning from Britain and Prussia, factories and arsenals were constructed during the 1860s and 1870s. Yet Feng’s proposal to revise the civil service examination—namely, replacement of the Eight-Legged Essays with a more practical content—was left unrealized, primarily because of opposition from the conservatives for fear of losing their influence in the government.

Feng was not the first scholar-official to call for reform, yet his contributions had far-reaching consequences. Unlike senior officials such as Lin and Li and earlier reformers such as Wei Yuan, Feng believed that mere borrowing and adaptation of Western techniques, primarily weaponry and military technologies, was not sufficient to strengthen China. Feng argued for a comprehensive reform in many areas, including the economy, education, politics, and customs. To accomplish this, Feng believed, China should learn Western ideas and systems. At the same time, Feng was aware that this proposal of learning from the West would inevitably arouse suspicion from the Confucian-trained officials and intellectuals, for it embodied the issue as to which civilization—Chinese or
Western—was superior. To resolve this Feng reiterated the superiority of China’s cultural heritage to the West. This remained the essence of his proposed reform. He then clarified that reform did not mean complete Westernization; only those practices deemed beneficial to China would be selectively adopted. Feng argued that Western ideas and techniques were merely supplemental, to be used for utilitarian purpose with no intention to displace the glorious Chinese civilization, thereby diluting the controversial issue of Sino-Western cultural conflicts.

Feng died of illness on 13 April 1874. Although Feng did not live long enough to ensure that all his reform measures would be implemented, his contributions were widely recognized and had far-reaching consequences. To honor his contribution, Li requested the construction of a memorial hall for Feng. Feng’s proposal for the abolition of the Eight-Legged Essay in the civil service examination was endorsed in the next reform movement of 1898.

Feng Shui

**Fengshui 风水**

Feng shui is the Chinese art of site orientation, which is based on the belief that the house (the dwelling of the living) or the tomb (the dwelling of the dead) can be situated physically to take advantage of the flow of qi within the environment.

In a holistic view of the cosmos, the human anatomy is a microcosm of the earth, and the blood veins of one correspond to rivers and streams of the other. The Chinese art of feng shui (literally meaning “wind water”) seeks to take advantage of this state of affairs. When the ground is broken and the well is dug for a new house, or when the excavation for a tomb is conducted, such action taps the qi meridians of the earth—called “dragon veins.” There are two major schools of feng shui—the Form School, where the physical aspects of the landscape are the focus, and the Compass School, where the astrological or cosmological orientation of the site is the focus of examination. Regardless of the type of feng shui, all site orientation methods purport to locate and characterize qi in the physical plane.

**Form School of Feng Shui**

The earliest Chinese text to discuss the physical environment of Form School feng shui is the *Book of Burial*, written in the fourth century C.E. It describes the environment as follows:

Arteries spring from low land terrain; bones spring from mountain terrain. They wind sinuously from east to west and from south to north. Thousands of feet high is called forces; hundreds of feet high is called features. Forces advance and finish in features. . . . Where forces cease and features soar high, with a stream in front and a hill behind, here hides the head of the dragon. . . . Where terrain winds about and collects at the center, this is called the belly of the dragon.

This is the geophysical character of the optimum site—called the dragon lair, but there is also a very important meteorological element in the physical description of the site. The following passage from the *Book of Burial* is the first time in recorded history that the term feng shui is used:

Qi rides the wind (feng) and scatters, but is retained when encountering water (shui). The ancients collected it to prevent its dissipation, and guided it to assure its retention. Thus it was called feng shui. According to the laws of feng shui, the site that attracts water is optimal, followed by the site that catches wind.

Wind and water are the means by which qi is controlled. Wind scatters qi, so its ingress should be blocked. Water collects qi, so its presence should be encouraged. This will ensure that sufficient qi surrounds the tomb or house. A proper translation of feng shui therefore is “(hinder the) wind (and hoard the) water.”
LOCATING QI IN THE ENVIRONMENT

It is the duty of the feng shui master to search the physical environment of the dwelling to locate the flow of qi. The Book of Burial describes how to find the elusive flow. “Where the ground holds auspicious qi, the earth conforms and rises. When ridges hold accumulated qi, water conforms and accompanies them.” “Ridges” in this passage is a physiological term referring to the arterial branches or vessels of the dragon veins. Where water flows on the surface, qi flows beneath the surface. In another passage, the relationship between earth, water, and qi is made even more explicit: “Earth is the body of qi—where there is earth there is qi. Qi is the mother of water—where there is qi there is water.” As mother and offspring, qi and water exhibit a natural attraction. Obtaining one is the means of acquiring the other.

When the flow of qi is discovered, then the feng shui master must look for the location where that flow slows down and pools or accumulates. The Book of Burial clarifies in this fashion:

Where the earth takes shape, qi flows accordingly; thereby things are born. For qi courses within the ground, its flow follows the contour of the ground, and its accumulation results from the halt of terrain.

This pooling or concentration of qi is an ancient concept that also began as an explanation of human physiology. The following passage is from a fourth century BCE Daoist book of philosophy called the Zhuangzi: “Man’s life is the assembling of qi. The assembling is deemed birth; the dispersal is deemed death.” This is why a pool of qi is advantageous for the burial site. According to the Book of Burial: “Life is accumulated qi. It solidifies into bone, which alone remains after death. Burial returns qi to the bones, which is how the living are endowed.” Somehow the pooling of qi around the interred bones affects the lives of the descendants of the deceased. This final passage reveals the metaphysical power of qi—its ability to enhance the lives of people in its proximity.

Mutual Resonance of Qi

The process whereby the bones are energized is called “mutual resonance.” According to the Huainanzi, a second century BCE text:

All things are the same as their qi; all things respond to their own class. . . . Things within the same class mutually move each other; root and twig mutually respond to each other.

The standard proof of mutual resonance given by the ancient philosophers is this: If a string on one lute is plucked, the same string on a nearby lute will simultaneously vibrate. It follows, then, that the qi of the interred corpse and the qi of the living descendants are identical. Therefore, when the vital, life-giving qi of the burial site surrounds the bones, they are energized like a dead battery being recharged, and the lives of the descendants are thereby endowed. The fact that the unplucked lute string vibrates because it is tuned to the sound waves produced by the plucked string was certainly not known by the ancient Chinese, although it is tempting to identify qi as a type of energy wave based on this analogy.
Qi and Magnetism

It is tempting to base scientific conclusions upon another analogy. The Chinese believe that qi flows through meridians within the human body just like it flows within ridges and branches in the earth. The acupuncture point on the human body is also called a cave or lair, so we can say that the mountain lair is simply the acupuncture point on the earth. When the grave is excavated or the foundation of the house is dug, the geophysical meridians are tapped just like those reached by the acupuncture needle in the human body. Certainly there are forces at work within the earth that cannot be seen or consciously felt by humans—especially magnetic fields. Some creatures do have an affinity for magnetic waves—dolphins, whales, sea turtles, and homing pigeons all have magnetite molecules in their brains that give them a magnetic sense of direction. The fact that hemoglobin contains a certain concentration of ferrous atoms leads some to conclude that the magnetic poles of the earth influence the directional orientation of the human body. Some modern feng shui adherents therefore claim that an electromagnetic radiation of some kind is the focus of feng shui. They base their claim on the fact that the compass was invented by the Chinese specifically to assist in the reading of terrestrial feng shui. While the Chinese may have believed early on that the unseen force called qi was responsible for the function of the compass needle, modern science has been unable to determine the influence of such energy on the well-being of humans. If qi could be proven to exist, or if magnetic fields could be proven to influence human life, then feng shui might be taken more seriously by the scientific community. Until then, its practice might be considered folk ecology rather than an environmental science.

So what exactly is qi? Thousands of pages of commentary have been dedicated to the explication of this term and no English translation can do it justice. While “energy” may capture some of its physical characteristics, such a word does not address its metaphysical qualities. While it originally meant steam or vapor (as in clouds), by the time of Confucius it had come to mean an animating force in the atmosphere (manifested in weather phenomena) that actively influenced the human body (manifested in fever, chills, delusions, etc.). The proto-science of Form School feng shui analyzed this force in the environment with the intention of controlling its manifestations in the individual. Such analysis was scientific only insofar as it was based on empirical observation. When other factors such as numerology and astrology were consulted by adherents of Compass School feng shui, the practice became less a science and more an art.

Compass School of Feng Shui

As we have seen in the Book of Burial, mountainous landscape is the optimum environment in which to trace the flow of qi. But not all landscape is mountainous, so there had to be a way to detect qi when the topographical forms and features did not protrude sufficiently to locate the hidden dragon veins. The Chinese believed that the realms of heaven, earth, and man were infinitely correlated, making it possible to read in the stars the qi of any given locale or any given person on earth. Furthermore, ancient Chinese thinkers believed that numbers underlie the operations of the phenomenal world. By knowing how these numbers change and transform, they could know how the spirits move. The numbers might be thought of as numerical equivalents of metaphysical entities like star spirits (especially the “Nine Stars,” but also including the five “moving stars,” or planets, the probable origin of the Five Elements) or other manifestations of natural forces, such as celestial and earthly conjunctions. One of the most important of such conjunctions was direction, not only the direction toward which a person faced on earth, but more importantly, the direction from which celestial influences were received by those on earth.

The Cosmograph

In ancient China there was no distinction between astronomy and astrology, because the stars in the night sky were celestial deities. Those with an understanding of the movement of stars therefore gained an understanding of the will of heavenly spirits. This was crucial information for the emperor, who was the center of the human realm, as Shang Di, or God on High, was the center of the heavenly realm. Shang Di’s celestial throne was the Big Dipper, around which all other stars revolved. The handle of the Dipper was the focus of his power, and was capable of dealing death and destruction in the direction to which it pointed. The Chinese accordingly created an instrument that was capable of determining the configuration of the
Big Dipper in the sky at any time of day or night. This was the *shipan*, or cosmograph, models of which have been discovered in early Han dynasty (206 BCE–220 CE) tombs.

The instrument consists of a square fixed earth plate on bottom and a rotating heaven disc on top. Around the circumference of both plate and disc are arranged the names of the twenty-eight constellations of the Chinese zodiac as well as the twelve Earthly Branches, representing the twelve months and the twelve double-hours of the day and night. In the center of the dial is a representation of the Big Dipper. The function of the instrument is similar to a planisphere—which allows the user to locate any star or constellation in the sky at any moment of the year, except that it is only the stars of the zodiac and the Big Dipper that are represented on the cosmograph.

While the Big Dipper in the center of the heaven plate is clearly the focus of the instrument, each of the four sides of the earth plate is marked with one of four greater constellations, each made of seven of the lesser constellations. There is the Green Dragon (composed of the Horn, the Neck, the Heart, and the Tail, for example), the Red Bird (composed of the Beak, the Gullet, the Crop, and the Wings, for example), the White Tiger, and the Dark Turtle. In any given season only one of these macro-constellations can be observed in its entirety in the night sky. In the ancient period the central constellation of each of the four deities occupied the center of the southern sky on the solstices and equinoxes. For example, on the summer solstice the Fire Star, the central star of the Heart of the Green Dragon, culminated at dusk. These great macro-constellations are also mentioned in the *Book of Burial*:

The Dark Turtle hangs its head,  
The Red Bird hovers in dance,  
The Green Dragon coils sinuously,  
The White Tiger crouches down.

But in this manual of burial feng shui the deities represent topographical formations surrounding the lair or tomb site—the coiled dragon toward the east, the crouching tiger toward the west, the hovering bird in the south, and hanging turtle in the north.

**THE FENG SHUI COMPASS**

The *shipan* cosmograph was the direct ancestor of the magnetic compass, and its earliest use by the Chinese was not for navigation but for properly orienting the dwelling site. The Big Dipper rotating on the heaven dial transformed into the needle of the compass as the *shipan* evolved into the *luopan*, or feng shui compass. The *luopan* is still the standard tool of the feng shui master. In the most popular type of Compass School feng shui the cardinal directions of the square, its four corners, and the center (a total of nine “directions”) are all assigned characteristics based on Chinese correlative cosmology. This is the so-called Nine Star feng shui (after the seven stars of the Big Dipper plus two companion stars) or Palace of Nine Halls (based on the 3-by-3 grid that represents the ideal dwelling).

The Chinese are masters of correlations based on the microcosm of man and the macrocosm of heaven and earth. For example, there is the two-term system of yin and yang; the four-term system of cardinal directions and seasons; the five-term system of the Five Elements or Phases—wood, fire, earth, metal, and water; the eight-term system of the *bagua*, or eight trigrams of the *Book of Changes*; the nine-term system of the Nine Stars; the ten Heavenly Stems and twelve Earthly Branches of the sixty-term sexagenary numbering system; the twenty-eight constellations of the zodiac; and so on. Each ring of the *luopan* represents one or more of these correlative systems. When a particular location is oriented by means of the compass, its various elevations could then be correlated according to any number of factors.

**THE FIVE ELEMENTS AND FENG SHUI**

Correlative cosmology can be quite complicated. For example, in the Nine Star system, each year is governed by one of the Nine Stars and is therefore characterized by a direction, a number in the Palace of Nine Halls, and a trigram of the *Book of Changes*. Most importantly, it has a particular phase or elemental character. Thus, based on the year of birth, every individual has his or her own characteristic element, number, direction and trigram. However, of all of the enumerated correlations, it is the element that is supposedly the key to good fortune. According to the concept of the Five Elements, qi naturally progresses through five different phases as time progresses. There are two primary systems of phase shift—the production order and conquest order—exemplified as follows. (See table 1.)
In Nine Star feng shui, any process that can be considered generative or productive will create good fortune. Destructive processes, on the other hand, create bad luck. For example, a person born under the element of metal would not want to live in a house facing the direction south, because south belongs to the element fire, and fire melts metal in the destruction order of the elements. A good direction for this person’s house to face would be southwest, because southwest belongs to the element earth, which harbors ores, thus producing metal. While the phase shift orders of the five elements are fascinating explanations of phenomenal change, like the Aristotelian concept of the “four humors” which they superficially resemble, they have no basis in scientific fact.

Feng Shui as a Belief System

For the numerous reasons mentioned, feng shui is not considered a science. As explained in the discussion of Form School feng shui, it is not the spirit of the ancestor that endows the living, but the ineffable qi that nourishes the ancestor’s bones. Thus nourished, the bones in turn “resonate” with the qi of the descendants. Without a spiritual aspect, it would appear then that feng shui is also not a religion. One scholar’s definition of qi as a psychophysiological power is an attempt to capture those aspects of the energy of qi that elude measurement. This would account for the purported intuitive powers of feng shui masters to locate qi in the environment, even when the topographical features of a particular locale do not conform well to the requirements of the text of the Book of Burial. This would also help to explain how the proper flow of qi benefits the living when there is no deceased to act as a “medium” between the physical environment and the human being. As a psychophysiological entity or event, *feng shui* may share its rate of success with a phenomenon in the medical community—the so-called placebo effect. Those whose ailments improve after being administered a placebo supposedly get better because they believe in the effect of the “medicine” they are receiving. If this effect can explain the influence of feng shui in modern society, then its practice is indeed similar to the practice of religion because the practitioner believes in the power of qi.

Further Reading

Throughout China’s premodern history, xiao (filial piety) was its most significant social value. It enjoyed such favor because it strengthened both the family’s coherence and the state’s authority. In modern times, despite repeated attacks by anti-traditionalists, xiao has continued to play an important role in Chinese social life; however, the one-child policy threatens to diminish its long-term significance.

Changing Definitions of Xiao

The word xiao first appears in texts and inscriptions during the Western Zhou period (1045–771 BCE), when it usually designated sacrifices in honor of ancestors. Hence, its earliest meaning seems to have been “to make food offerings” to one’s ancestors, lineage, in-laws, and even friends. Yet it was also applied to the living, in which case it meant “to support or nourish,” or “to follow one’s elders’ wishes.” By the Warring States period (475–221 BCE), Confucians reinterpreted xiao by narrowing its focus to serving one’s parents. When his parents were alive, a good son should fulfill their material needs, cater to their whims, and obey their commands; when they died, for three years he should mourn them and continue their traditions. Mourning for three years, a Confucian innovation, meant enduring a number of austerities, such as quitting office, wearing rough hemp robes (rather than silk ones), living in an exposed lean-to, and avoiding meat, sex, alcohol, and music. In short, Confucians redefined xiao so that it would serve one’s immediate family rather than the lineage.

With the emergence of a unified empire in 221 BCE, some educated men, more of whom were becoming state officials, emphasized the political and metaphysical aspects of filial piety. Politically, they stressed what the historian Norman Kutcher has termed “the Confucian parallel conception of society” (1999). That is, if a son is loyal to his parents, he will more than likely also be obedient to the emperor. Analects 1.2 states this concept as, “Few are those who by character are filial and brotherly yet are still fond of opposing those above.” Due to the stabilizing effects of filial piety, nearly every imperial
dynasty esteemed and propagated the third-century BCE Classic of Filial Piety (Xiaojing 孝經), which clearly articulates xiao as loyalty to political authority. When steppe nomads conquered China, Xiaojing was the first text that they translated into their own language. At the same time, the Classic of Filial Piety and other early imperial Confucian texts stress the metaphysical properties of filial piety. Xiao is not only a type of behavior but is also a spiritual essence that literally connects people with the cosmos. As a result, Heaven responds favorably to those individuals who are loyal and punishes severely those who are not.

In early imperial times, filial piety reached a fever pitch: scholar-officials were not merely performing the mourning rites; many were exceeding them. Some sons mourned each parent for six years rather than just the customary three; others forever declined to consume meat and alcohol. Remarkable feats of filial action were disseminated widely through books called Accounts of Filial Children (Xiaozi zhuan 孝子傳). Illustrations of stories from these works soon decorated everyday objects, the walls of schools and government offices, and tomb interiors. By the early twentieth century, the most ubiquitous book in China was the Twenty-four Filial Exemplars (Ershisi xiao 二十四孝), which every child knew by heart. These narratives received such a welcome no doubt because they strengthened the patriarchal family system. They urged adult sons to live together and to submit unconditionally to their parents’ commands. Filial piety was of such great consequence in Chinese society that to compete with the Confucians, both Daoists and Buddhists found it necessary to craft and market their own version of it.

**Xiao’s Modern Fate**

During the early twentieth-century’s New Cultural Movement (also known as the May Fourth Movement),

This paper cutout depicts the legendary figure of Mu Lan, a woman who expressed her filial piety by disguising herself as a man to join the army and serve twelve years in place of her elderly father.

A father sits on a park bench, sharing lunch with his child. Photo by Joan Lebold Cohen.
modernist reformers sharply attacked filial piety and the patriarchal family system it promoted. Many cultural forms that expressed filial piety, such as the three-year mourning rites, were abandoned. Despite the fact that it never lost its importance in Hong Kong or Taiwan, filial piety came under even more duress during the Cultural Revolution (1966–1976). With Deng Xiaoping’s economic reforms of 1978–1997, filial piety has regained some of its former stature. To provide care for an aging and pensionless rural population, the state has once again promoted filial piety: children are required by law to take care of their parents. Hence, the state has redefined filial piety as supplying the material needs of elderly parents. But other factors have significantly reduced filial piety’s social importance: adult children usually no longer live with their parents, and their parents oftentimes do not control significant economic resources. Thus, although filial piety remains important as a moral value, its grip on social life has significantly weakened.

Fireworks and Firecrackers

Huāpào 花炮

Fireworks have been used in China, the producer of 90 percent of the world’s fireworks, in various forms for at least two thousand years. In ancient times people would frighten away creatures (real or imaginary) by throwing bamboo on fires. Some historians say fireworks as we know them originated in 1723 with an edict by the new Yongzheng emperor demanding entertainment to celebrate the first year of his reign.

The general Chinese term for firecrackers and fireworks is huapao, which is a portmanteau of the words yanhua and paozhu. Yanhua (smoke and flowers) or yanhuo (smoke and fire or colorful fire when yan is pronounced in a different tone) refers to fireworks. Paozhu (cannon bamboo) or paozhang (cannon stick) refers to firecrackers, which once were called baozhu (exploding bamboo).

Origin

Wang Anshi (1021–1086), a great thinker and man of letters of the Song dynasty (960–1279), wrote in a poem that “baozhu sheng zhong yi sui chu; chunfeng song nuan ru tusu”:

Amidst the crackling of exploding bamboo a year is gone;
In the warmth of a spring breeze we drink the wine of tusu (Wang, 1999)

This couplet vividly describes how people of his time celebrated the Spring Festival or Chinese New Year by drinking tusu wine (made with medicinal herbs) and burning bamboo to create loud noises; both customs go far back in history. According to a legend, on every Chinese New Year’s Eve, a nian (a man-eating monster) would come out of the mountains to prey on humans. A god in the guise of a beggar scared the monster away with the crackling of burning bamboo. Humans then followed his example. Shen yi jing (Book of Gods and Spirits), a classic of the Han dynasty (206 BCE–220 CE), shows how the custom could have grown from everyday practice. In ancient times, when camping deep in the mountains, people built bonfires to cook and to keep themselves warm. A strange human-shaped mountain goblin called shanxiao (von Glahn, 2004), however, often harassed them despite the fire, carrying a disease that could cause chills and fever. The campers then used bamboo as firewood. As it crackled while burning, it frightened the animal and kept it away from them.

History

Although burning bamboo to celebrate the Chinese New Year was still prevalent during the Southern Song dynasty (1127–1279), people had already begun to stuff saltpeter (potassium nitrate) into bamboo sticks to get more exciting effects as the sticks burned. The discovery of saltpeter was attributed to alchemists in the sixth or seventh century who used it along with sulfur and charcoal to produce dan (medicinal pills believed to make humans live forever). But by combining the right ratio of the three
components, they formed gunpowder. The inventor who chanced upon the correct combination was said to have been Sun Simiao, who lived sometime between 541 and 682. An alchemist as well as a pharmacist, he is regarded as the father of gunpowder in China.

When paper became more prevalent in the Song dynasty (960–1279), people rolled sheets of paper into small tubes in place of bamboo tubes, stuffed gunpowder into them, and fixed a fuse into each; the first modern-day baozhu (firecrackers) thus came into existence. People then strung and fused smaller baozhu together so they could be set off one by one in close sequence to create continuous explosions. People called this type of cluster bian (whip) or bianpao (whip cannon). By that time the military had already used rockets in battles, and the technology led to the invention of eritijiao (kicking twice) or liangxiang (sound twice), both referring to cannon crackers. A cannon cracker could be set on the ground or held gingerly in the hand; with the ignition of the fuse its lower section exploded and produced from its bottom a powerful jet that catapulted the top part into the sky, where it exploded again with a loud report that could be heard far and wide.

Yanhua (fireworks) did not become popular until the Qing dynasty (1644–1912), although some historians claim that it had been invented a few hundred years earlier. Some historians ascribe the birth of modern fireworks to the Yongzheng emperor (1678–1735). It was said that in the first year of his reign (1723), he ordered that novelty huapao be made for the coming Lantern Festival, which was characterized by the display of various kinds of lanterns to mark the end of the Chinese New Year season on the fifteenth day of the first lunar month. The burden fell to Li Tai, a huapao specialist. When he chanced to see colorful sparks shot out of iron being hammered in a blacksmith shop, Li Tai got the idea of mixing different sizes of iron particles with gunpowder to create the fireworks and propelling them into the sky with saltpeter.

Types

By the 1930s and 1940s a variety of fancy fireworks existed, such as those called “ground mouse,” “swan with eggs,” “drops of gold,” “turnip flower,” “big-leaf orchid,” “big-leaf chrysanthemum,” “double plum blossoms,” “three layers in a row,” and “double dragons playing with a pearl.”

Production

Fireworks consist of combustibles (powders of aluminum and iron), flash and sound compositions, and glue (usually natural resin and dextrin). The compositions are
rich in potassium chlorate, antimony sulfide, potassium perchlorate, and potassium benzoate. The production of fireworks involves a complex process of composition grinding, sifting, drying, purifying, mixing, granulating, and pressing.

Early in the mid-eighteenth century Liuyang County of Hunan Province had become a center of huapao (fireworks) production, producing 140,000 cartons a year. Today more than seven thousand factories employ about 1 million people. The factories are mostly in the provinces of Hunan and Jiangxi.

**Market**

Not only is China the birthplace of huapao, but also it has been the largest producer and exporter since the 1860s. In 2005 China sold 13 billion yuan ($1.8 billion) in fireworks, one-third of which was exported to more than one hundred countries. That amounts to 90 percent of world production and 80 percent of world trade in fireworks.

For safety reasons most Chinese cities banned fireworks in the 1990s. But with the rise of national pride amid economic success, the mounting cry to respect traditions lifted or partly lifted the ban in nearly all cities, thereby reopening a large domestic market. New products like the gigantic foot prints and smiling faces fired during the massive and magnificent display of fireworks at the opening and closing ceremonies of the Beijing 2008 Olympic Games demonstrate the ingenuity and creativity of the Chinese firework producers. This impressive display surely helps to increase the share of Chinese fireworks on the world market even further. To promote international trade, Liuyang, a stronghold of China’s huapao industry, has held the Liuyang International Huapao Festival every other year since 1990.
Challenges and Possible Solutions

The Chinese huapao industry still faces a number of challenges, such as poor management, small-scale production, substandard technology, deficient training mechanisms, and little pollution control. As a result, fatal accidents occur frequently. From October to November 2007 eighty-six people died in twelve accidents. The fire that destroyed a huge storage hub in Foshan City, Guangdong Province, on 14 February 2008 proved devastating to the industry throughout the country.

China is trying to build better storage facilities and to produce smokeless, nontoxic, pollution-free fireworks that create the same excitement. It is also experimenting with noncombustible products that can mimic the effect of firecrackers but with reduced noise.

Fishing Industry

Yūyè 渔业

Due to rapid growth and expansion in the twentieth century, China’s fishing industry is the largest in the world. This growth, however, has caused widespread overfishing and endangered species, forcing the Chinese government to set up methods to control industry practices and protect the waters from pollution.

China is the world’s largest fish producer, accounting for approximately one-third of world production. Since 1989, the country’s fishing industry has grown dramatically, contributing $30 billion to the economy in 2002, about 3 percent of gross domestic product (GDP). The rapid growth of China’s fish culture has not only added to the country’s food supply, it has also created employment and income. The industry is divided into four sectors: marine fishing, mariculture, freshwater fishing, and freshwater culture.

China’s Traditional Fishing Industry

Some form of aquaculture—the raising of aquatic animals and plants—has been practiced in China for over 3,000 years. The earliest known manual on fish farming was written around 475 BCE and is attributed to a wealthy landowner by the name of Fan Li. According to legend, Prince Wei of Qi asked Fan Li how he became so wealthy. Fan replied: “There are five ways to make a fortune, and the most important one is pisciculture.” He advised the emperor to make the country rich by raising fish, particularly carp because they grow quickly and do not eat their young.

Polyculture (the raising of multiple fish species) was introduced in the Tang dynasty (618–907 CE) when the consumption of common carp was forbidden because its name, li, had the same sound as the surname of the imperial family. Fish farmers then began to grow several species of fish together in ponds. Up to nine different fish species (primarily herbivores), each feeding on different resources, were spawned in the balanced ecosystems of artificial fishponds. This practice was less labor intensive, less polluting, and more efficient in the conversion of biological energy than monocultural systems that relied on carnivorous fish species.

Integrated fish farming was developed in the Pearl River delta in South China around 1400 CE. This method created a complex dike-pond ecosystem that utilized a variety of resources and reduced organic pollution. For example, livestock and poultry manure made good fertilizers for fish farming. Crops, such as mulberry, were grown on the dike banks. Silkworms were raised on the mulberry, and the silkworm pupae were used as fish feed. The worm feces and wastewater from silk processing could be used as pond fertilizers, and the pond silt could be used as fertilizer for the plants on the dikes or for fodder crops, which could then be used to feed livestock, poultry, and fish.

The practice of fish farming in rice paddies, first documented in the third century, likely arose when rice farmers noticed that monsoon floods would wash wild fish...
into the ponds that had been dug in the rice fields for water storage and irrigation. The realization that two crops could be cultivated at the same time on the same plot of land inspired farmers to learn how to grow fish in captivity. Later, farmers learned to cultivate those species of fish that would help control rice weeds and harmful insects as well as provide fertilizer for rice fields.

Modern Fishing Industry

After economic reforms began in 1978, China’s fishing industry expanded dramatically, becoming one of the fastest growing sectors among the country’s agricultural industries. A growing market economy combined with declining state monopolies and the lowering of trade barriers between Chinese regions created an environment in which the aquaculture industry could thrive. Technological advancements also paved the way for expanded production. An artificial breeding program for carp that was developed in the 1950s led to a surge in carp farming. Production of other species, such as seaweed, mollusks, crustaceans, and fish, grew rapidly after the 1980s. In 2003, total aquaculture production was 30.28 million metric tons compared with 1.23 million metric tons in 1979. Fish from capture fisheries and aquaculture increased from 20 percent of total animal products in 1985 to 32 percent in 2002.

Marine capture fisheries dominated production until the 1980s, when the depletion of many major marine fisheries forced the government to focus on developing aquaculture. In 1978, marine capture fisheries accounted for 73.9 percent of total aquatic production. By 1993, over 50 percent of total fish production came from aquaculture, making China the first major fish-producing country to have higher production from aquaculture than from wild capture fishing.

In 2004, marine fisheries produced 26.17 million metric tons of output. Marine capture fisheries contributed 14.47 million tons, including production from

Fishing boats in Shanghai. Photo by Joan Lebold Cohen.
distant-water fisheries. In that same year, China’s marine fishing fleet consisted of nearly 280,000 motorized fishing vessels, a significant increase from the 50,000 motorized vessels in 1980. Those vessels operate within China’s national boundaries as well as on the high seas and within the boundaries of other countries that have agreements with China, such as Japan, Republic of Korea, and Vietnam.

Mariculture, or marine culture in intertidal zones, small bays, and shallow seas, accounted for 5.8 percent of total catches in 1970. But marine and brackish water aquaculture has grown over the last couple of decades as the culture systems have diversified to include floating rafts, pens, cages, indoor tanks with water recirculation, sea-bottom culture, and sea ranching. Before 1980, the main farmed species were kelp, laver (red algae with fronds), and mussels. A variety of marine fish species and mollusks have since been developed for farming and include seaweed, fish, crustaceans (especially prawns), and mollusks (particularly scallops). Output increased from 9.7 million metric tons in 1999 to 13.2 million metric tons in 2004. The increase in output was mainly in shellfish and seaweed. Mariculture has benefited recently from the practice of integrated culture, where some species may be bred with others, such as mollusks in prawn ponds or with cultivated seaweed. Integrated farming methods produced over 300,000 metric tons in 2004.

Carp continues to be the most important species of fish cultured in China, and the number of species increased from 12 in 1999 to 39 in 2004. Finfish account for 91 percent of total inland culture output, crustaceans 6.4 percent, and algae and other species (soft-shell turtle, frog, etc.) make up the remainder.

Since the 1950s, fish culture has spread from the traditional core areas of the Yangzi (Chang) and Pearl river deltas to virtually all provinces. Even lakes and reservoirs in remote regions and paddy fields in mountainous areas have been exploited. Nonetheless, pond culture is the most popular method of fish farming in China, accounting for 70 percent of total inland culture output in 2004. In formerly less-developed regions in the north, northeast, and northwest, the output of freshwater aquaculture has grown from 2.8 percent of the country’s total in 1979 to 15.42 percent in 2002.

Open-water fish farming in reservoirs, lakes, rivers, and channels has become more productive in recent years through the use of cages, net enclosures, and pens. The average unit output of inland aquaculture has increased about 10.72 times, from 297 kilograms per hectare in 1979 to 3,185 kilograms per hectare in 2003.

Rice paddy fish farming has grown from small-scale production to an important commercial activity. Paddy areas for fish farming expanded to 1.56 million hectares in 2003, with a total output of 1.024 million metric tons. Carp is the main species to be farmed, but Chinese river crab has become more popular because of its increased profitability.

Before 1960, fish farmers depended on fry (immature fish) from wild stock to seed their farms. Between 1958 and 1960, techniques were developed to artificially induce spawning for the four main species of carp, greatly increasing the availability of fry. Later, artificial propagation techniques, including induced breeding and hatching and larval breeding, were developed for additional varieties of fish. The expansion of fry production by artificial propagation was especially rapid after 1978. By the 1990s, most counties had at least one fingerling (fish up to a year in age) farm to supply local fish farmers.

After a period of rapid growth, the industry has encountered a serious decline in traditional high quality fishery resources. By 1990, average yields in capture fisheries had dropped to less than 50 percent of 1950s levels. Many traditional species have been overexploited, and harvests have increasingly shifted toward juvenile fish and low-value species. Industrial and domestic discharge has contaminated many lakes, rivers, and coastal areas. Red tides—massive concentrations of microscopic algae that flower and multiply rapidly—have caused serious losses in mariculture production along the South China coast.

The government first formulated a sustainable development strategy for its marine program in 1996. In 1999, the government set forth a goal of “zero growth” in coastal marine capture fishing, and it enacted a plan of “minus growth” in 2001. To achieve these goals, the government began reducing the number of fishing vessels in 2002 and moving fishermen away from marine capture fisheries. By 2004, the government had spent nearly $100 million, scrapped nearly 8,000 vessels, and relocated over 40,000 fishermen. In 2006, the government issued the Programme of Action on Conservation of Living Aquatic Resources of China. The plan calls for a halt to the deterioration of
aquatic environments, the decline of fishery resources, and the increase in the number of endangered species by the year 2010. Overcapacity is to be reduced, while efficiency and economic benefits are to be increased.

Further Reading

Taiwan has one of the largest fishing industries in the world. But because Taiwan no longer holds a seat in the United Nations, it is often left out of standard U.N. doctrines that monitor and regulate fishing. The dilemma of how to handle Taiwan’s unique situation while maintaining fishing-industry standards is an issue still to be addressed.

Taiwan is home to 23 million people and one of the world’s largest distant-water fishing fleets. In some of the world’s oceans, including the Pacific Ocean, Taiwan boasts more fishing vessels than the major fishing nations of Japan, Korea, Spain, and the United States. In particular, Taiwan has large numbers of fishing vessels that target tuna species by long-line and purse-seine (a large wall of netting that encircles a school of fish) methods.

Due to the increasing threat of overfishing throughout the world’s oceans, the internationally accepted management practice has been to create regional fisheries management organizations (RFMOs) to regulate the amount and method of fishing in defined areas of the world’s oceans. These are created by international conventions. A dilemma for the international community is how to include Taiwan within these legal frameworks in light of Taiwan’s non–United Nations (U.N.) recognized status. (After nearly two decades of conflict over which government—the Republic of China [ROC, Taiwan] or the People’s Republic of China [PRC]—should represent China in the U.N., the PRC replaced the ROC in a November 1971 vote by the U.N. Security Council.)

International Fisheries Agreements

The United Nations Convention on the Law of the Sea (1982) (LOSC) provides the broad framework for the conduct of fishing within the maximum 200 nautical mile “Exclusive Economic Zone” of coastal States. It also creates a duty on all State parties to cooperate in the exploitation and management of shared living resources. It was envisaged by the drafters of LOSC that specific regional fisheries arrangements would be adopted based on the notion of State cooperation and the need to establish effective mechanisms to manage fishing activities on the high seas. Numerous regional fisheries agreements have since been made. These apply in defined areas and generally concern high value migratory species, especially tuna. These agreements are entered into on a voluntary basis by the flag States of the vessels involved in fishing for the species in the relevant areas. It is essential that all countries that have vessels fishing for these species sign these agreements. If they do not, the effectiveness of the agreements will be limited because they will fail to regulate all the fishing that takes place for the particular species. This is because countries are only bound by international agreements to which they have voluntarily signed. Fishing vessels from countries...
that do not sign such agreements generally have complete freedom of fishing on the high seas. An obvious problem arises due to the unique situation of Taiwan. It is not able to sign U.N. agreements, such as LOSC. Although less than thirty countries formally recognize Taiwan as an independent State, many more countries have shown remarkable pragmatism by devising a creative method to enable Taiwan to sign international fisheries agreements and to participate in the work of RFMOs. The solution has been to enable Taiwan’s involvement in RFMOs as a “fishing entity.” The use of this term is seen as not disturbing the “One China” concept.

The “Fishing Entity” of Taiwan

The “fishing entity” concept has been used in nonbinding U.N. fisheries instruments such as the 1995 Code of Conduct for Responsible Fisheries and the 2001 International Plan of Action to Prevent, Deter and Eliminate Illegal, Unreported and Unregulated Fishing. These documents are directed towards States and “fishing entities.” Although the term is expressed in the plural, it is generally accepted that it applies only to Taiwan. This is an example of the delicate wording needed in international documents because even de facto recognition of Taiwan is a sensitive matter for international diplomacy.

The first time the term “fishing entities” was used in a binding international instrument was in 1995 in the U.N. Fish Stocks Agreement. The Agreement states that, in addition to State parties, it applies “to other fishing entities whose vessels fish on the high seas” (Article 1.3). This provision has provided the pathway for Taiwan to be involved in regional fisheries arrangements. The U.N. General Assembly has endorsed the Agreement.

Taiwan has been included in a number of regional fisheries agreements, but there is no uniform method for its inclusion. As a general rule, Taiwan has achieved fuller participation in RFMOs that do not fall under the U.N. mandate.

Taiwan participates as “Chinese Taipei” in the Commission for the Conservation and Management of Highly Migratory Fish Stocks in the Western and Central Pacific Ocean. The Convention which constitutes the Commission enables “any fishing entity whose vessels fish for highly migratory fish stocks in the Convention Area” to agree to be bound by the regime established by the Convention. Taiwan has a special status as a “Cooperating Fishing Entity” in the International Commission for the Conservation of Atlantic Tunas. “Chinese Taipei” participates as an observer in the Inter-American Tropical Tuna Commission. “The Fishing Entity of Taiwan” is a member of the Commission for the Conservation of Southern Bluefin Tuna through the Convention for the Conservation of Southern Bluefin Tuna. Significantly, Taiwan has voting rights in the Extended Commission equal to those of other members.

The concept of Taiwan as an “entity,” or something similar, has potential in other fields. For example, Taiwan, like other member “economies,” became a member of the Asia-Pacific Economic Cooperation in 1991 as the “economy” of Chinese Taipei. Also, Taiwan joined the World Trade Organization in 2002 as the “Separate Customs Territory of Taiwan.” But Taiwan has not yet been able to join the World Health Organization as a “health entity.”

Concessions

Even though the concept of “fishing entities” has increased Taiwan’s ability to engage in fisheries-related international activities with other countries, it has only come about due to Taiwan’s preparedness to make some significant concessions. These include using the name “Chinese Taipei,” accepting restrictions such as not being able to chair sessions or hold meetings in Taiwan, and having a limited or no role in decision making.

An Interesting Future

The international acceptance of Taiwan as a “fishing entity” is interesting in terms of the ongoing delicate nature of China-Taiwan relations and the manner in which other countries formally deal with Taiwan. The concept recognizes that Taiwan possesses full autonomy regarding the conduct of its fishing fleet and in its relations with other countries regarding fisheries matters. It also means that Taiwan’s legal obligations in most of the RFMOs in which it is a member are equivalent to those of State parties. However, the widespread use of the term “fishing entities” as a means to enable Taiwan’s participation in
international fisheries management does not mean that other countries have accepted that Taiwan is a state.

One of the darkest times in Chinese history, the Five Dynasties and Ten Kingdoms was an era of political anarchy, national disunity, corruption, and social upheaval in China, beginning with the demise of the Tang dynasty (618–907 CE) and ending with the founding of the Song dynasty (960–1279).

The Five Dynasties and Ten Kingdoms (五代十国 Wudai Shíguó)—or Ten Nations—was a tumultuous period of Chinese history named for the five successive short-lived dynasties (none lasted more than sixteen years) and the ten major kingdoms that existed during a period that commenced with the fall of the Tang dynasty in 907 CE and ended with the succession of the Song dynasty in 960 CE. Some scholars contend that there were eleven or twelve kingdoms; the Taiwanese historian Bo Yang calculated eleven (including Yan and Qi), but not Northern Han, perceiving it as a continuation of the Later Han. Traditionally, only ten are listed, hence the name “Ten Kingdoms.” Nonetheless, this was a period of social disunity, administrative corruption, political fragmentation, endemic warfare, and the collapse of the monetary system. The cumulative effect of this upheaval was the collapse of northern China’s irrigation system, and the regularity of the seasons that such a system ensured: Canals silted and dams fell into disrepair, floods devastated the countryside, and widespread famine was widespread. In northern China, dynasties succeeded each other in rapid succession, while in southern China polities existed concurrently with each controlling a specific geographical area.

Towards the end of the Tang Dynasty, the imperial government granted increased powers to the autonomous regional military governors who became further independent and were no longer subject to the authority of the central government. The Tang emperors, lacking soldiers for the imperial army and facing with military conscript desertions, had become “playthings” of the warlords. The inability to collect revenues and depleted treasury led to a monetary collapse that was exacerbated by a major decline in agricultural production. Attacks by the Turco-Mongolian Khitan and the lack of manpower for the continuous maintenance of dams and canals devastated the agro-economy. In the north, famine lead to the formation of roving bands of robbers who pillaged towns and ravaged public buildings and destroyed irrigation works vital to agricultural production that had been controlled by the central government, and massacred the wealthy and foreign merchants. Collectively, these bands had up to 600,000 men during this era of instability and turmoil.

At the end of the Tang dynasty, political power shifted quickly from the imperial government so that regional military governors (jiedushi) gained control, and by the tenth century, powerful jiedushi became de facto autonomous. In addition, a severe blow to the central government’s authority was dealt by the Huang Chao Rebellion (875–884), in which Huang Chao, a failed civil service examinee turned salt smuggler, led starving peasants and criminal gangs in guerilla warfare against the forces of the Tang.
The Five Dynasties

The Five Dynasties were the Later Liang dynasty (907–923 CE), Later Tang dynasty (923–936 CE), Later Jin dynasty (936–947 CE), Later Han dynasty (947–951 CE or 982, depending if Northern Han is considered part of the dynasty), and Later Zhou dynasty (951–960 CE). Nearly a dozen regional jiedushi are also known: Yan, Qi, Chengde Jiedushi (also known as Zhao), Yiwu Jiedushi, Dingnan Jiedushi, Wuping Jiedushi, Qingyuan Jiedushi, Yin, Ganzhou, Shazhou, and Liangzhou.

The polities in northern China included:

- Zhu Wen at Bianzhou (modern Kaifeng, Henan Province), precursor to Later Liang dynasty;
- Li Keyong and Li Cunxu at Taiyuan (Shanxi Province), precursor to Later Tang dynasty;
- Liu Rengong and Liu Shouguang at Youzhou (modern Beijing), precursor to Yan;
- Li Miaozen at Fengxiang (Shaanxi Province), precursor to Qi;
- Luo Shaowei at Weibo (modern Daming County, Hebei Province);
- Wang Rong at Zhenzhou (modern Zhengding County, Hebei Province);
- Wang Chuzhi at Dingzhou (modern Ding County, Hebei Province).

In the north, the powerful warlord Zhu Wen contrived to have Emperor Zhanzong assassinated in 904, placing the emperor’s thirteen-year-old son on the throne; three years later he induced the boy to abdicate in his favor, and Wen then proclaimed himself emperor (913–923), thus establishing the Later Liang dynasty. Rival warlords declared their own independence in northern China and the most successful established the Later Tang dynasty (907–923 CE) under four sovereigns: Li Cun Xu (923–926), Li Si Yuan (926–933),
Li Cong Xu (933–934), and Li Cong Ke (934–936). In 936, Shi Jingtang, a Shatuo Turk jiedushi from Taiyuan, was aided by the Manchurian Khitan Empire in what proved to be a successful rebellion against the dynasty.

The third dynasty was Jin (936–947 CE) under Shi Jing Tang (936–942) and Shi Chong Gui (942–947). In 943 the Khitans declared war on the Jin and three years later seized the capital of Kaifeng, marking the end of the Later Jin dynasty. The Later Han dynasty (947–950 CE) was led by Liu Zhi Yuan (947–948) and Liu Cheng You (948–950). The jiedushi Liu Zhiyuan entered the imperial capital in 947 and founded the Later Han, thereby establishing a third successive Shatuo Turkic dynasty. The fifth dynasty, the Later Zhou (951–960 CE), was led by three emperors: Guo Wei (951–954), Chai Rong (954–959), and Chai Zong Xun (959–960). The Later Zhou conquered much of the Southern Tang from 956–958, and in settlement the Tang ceded all lands north of the Yangzi River to the Zhou. Chai Rong sent armies against the Khitans in 959 in an attempt to regain territories lost during the Later Jin dynasty.

In southern China the polities included:

- Yang Xingmi at Yangzhou (Jiangsu Province), precursor to Wu;
- Qian Liu at Hangzhou (Zhejiang Province), precursor to Wuyue;
- Ma Yin at T anzhou (modern Changsha, Hunan Province), precursor to Chu;
- Wang Shenzhi at Fuzhou (Fujian Province), precursor to Min;
- Liu Yin at Guangzhou (Guangdong Province), precursor to Southern Han;
- Wang Jian at Chengdu (Sichuan Province), precursor to Former Shu.

The Ten Kingdoms

The Ten Kingdoms (or Nations) included the Wu Yue (904–978 CE), which had five emperors: Qian Liu (904–932), Qian Yuan Quan (932–941), Qian Zuo (941–947), Qian Zong (947), and Qian Chu (947–978). The Min Kingdom (909–945 CE) had at least five monarchs, as did the Jing Nan or Nan Ping Kingdom (906–963 CE).

The Chu Kingdom (897–951 CE), Wu Kingdom (904–937 CE), Southern (Nan) Tang Kingdom (937–975 CE), Southern (Nan) Han Kingdom (917–971 CE), Northern (Be) Han Kingdom (951–979 CE), Former (Qian) Shu Kingdom (907–925 CE), and Later (Hou) Shu Kingdom (934–965 CE) were the other regional states.

Implications of the Period

The nearly continuous warfare in chaotic northern China led to the displacement of peasant farmers and village craftsmen who became refugees and fled to southern China, where a stable society facilitated the development of technologies, science, culture, and the arts. Painters, calligraphers, and poets emerged during this period, notably Li Yu, the last emperor of the Late Tang, who was renowned as a great master of the ci (song lyric) poems in Chinese literary history. In 910 the king of Wuyue built Hanhaitang Dyke to facilitate agricultural production and enhanced his own wealth and position. Among the significant technological events were the manufacture of porcelain by the southern Chu (still famous for its Changsha Kiln) and the development of printing, which resulted in the publication of numerous Confucian, Buddhist, and Daoist classics, including the first complete set of 130 volumes of Confucian writings.

Nonetheless, southern China also suffered from endemic warfare as the Wu Yue fought with other polities until they were supplanted by the Southern Tang. In the 940s Min and Chu had political administrative crises that gave the Southern Tang the opportunity to destroy the Min in 945 and Chu in 951. However, remnants of Min and Chu survived as Qingyuan Jiedushi and Wuping Jiedushi. The Southern Tang became the most powerful polity in southern China but was unable to repel the incursions by the Later Zhou dynasty. The Northern Song dynasty, established in 960, sought to reunify China and succeeded against the Jingnan and Wuping in 963, the Later Shu in 965, the Southern Han in 971, and Southern Tang by 975. By 978 the Northern Song had gained the territories of the Wu Yue and Qingyuan, thereby bringing all of southern China under the control of the central government.

Five Elements, The

Wǔxíng 五行

Often called the five material elements of the world and compared with Aristotle’s four elements, the Chinese wuxing, or “five movements” refer instead to the physical processes of water sinking, fire rising, wood bending, metal molding, and soil growing. The philosopher Zou Yan (350–270 BCE) is credited with being the first to combine the theory of yin and yang with that of wuxing to create a unified cosmology.

During the Warring States (475–221 BCE) period of ancient China, when feudal kingdoms were vying for supremacy and chaos reigned, the search for a correspondence between natural and social order was the overriding concern of the great thinkers of the day. This was the blossoming of the “hundred schools” when philosophical reasoning flourished. Ontological questions (those dealing with the nature of existence) were debated in the intellectual centers of the various states, and the answers to such questions became the origins of metaphysics and cosmology. As to the question of what constitutes the universe, the Chinese posited qi as the constituent matter or energy, and wuxing (the “five elements”) as its physical manifestation.

The origin of the concept of wuxing is unknown, but scholars speculate that the five xing or “movements” were originally the gods of the five visible planets, or “moving” stars, which share their names with the elements (Mars is the “Fire Star,” Mercury is the “Water Star,” etc.).

The wuxing categories sport the seemingly elemental designations — water, metal, fire, earth, and wood — which explains the term’s earliest English translation. But rather than being merely material elements of the world, these categories refer instead to physical processes. This is evident from the first textual explication of the concept (occurring in the “Great Plan” section of the Book of Documents), where the wuxing are described as water sinking, fire rising, wood bending, metal molding, and soil growing. Scholars now refer to wuxing as the “five processes” or “five phases.”

Transmutation of the Wuxing

The intellectual center where early theories of wuxing received their first hearing was an academy in the

The symbols for the five sacred Daoist mountains in China represent the five elements: water, fire, earth, wood, and metal, which correlate to the four cardinal directions (and center) of the square. Northern Peak is associated with the water element and the color black.
northeastern state of Qi called Jixia, founded towards the close of the fourth century BCE. An eclectic text called the *Guanzi* originated here, chapter 8 of which introduces the concept of the transmutation of the five processes. Several enumeration orders of the *wuxing* would be developed over time, but perhaps the most important sequence and the one outlined in the *Guanzi* was that of “mutual production.” It may be characterized as follows:

- Wood produces fire (by combustion);
- Fire produces earth (as ash builds the soil);
- Earth produces metal (by harboring the ores);
- Metal produces water (as condensate on bronze caldrons);
- Water produces wood (as it nourishes woody plants).

These phases of physical transmutation were then correlated with the cycle of the four seasons and the square of the four cardinal directions. The fire phase, the process of heating, matched south and summer, while the wood phase, the process of vegetal growth, matched east and spring. Water was matched with north and winter because ice and snow—the solid phase of water—accumulate there in that season. Soil was relegated to the center, since all of the other phases either originated in soil (the ores of metal and growing wood) or terminated there (the ash of fire and soaking water). That left the metal phase to be matched with autumn and west. With these correlations established, beginning in the center with soil and following the natural order of the seasons, the whole sequence was interpreted as the order in which the phases generate each other throughout the year.

---

**Zou Yan, and the School of Yin and Yang**

The philosopher most closely identified with the theory of *wuxing* is Zou Yan (350–270 BCE), one of the first masters in attendance at the Jixia Academy. He is the purported leader of the School of Yin and Yang, and is credited with combining the theory of yin and yang with that of *wuxing* to create a unified cosmology. Unfortunately, none of his writings have survived and little is known about him aside from his state of origin—Qi, the location of Jixia. Zou Yan’s unique contribution to the history of Chinese cosmology was to correlate what he called the “five powers” with the cyclical patterns of human history so that the rise and fall of dynasties could be predicted. He based this idea on the second most important of the enumeration orders—the mutual conquest order, which may be characterized as follows:

- Earth conquers water (by damming it);
- Water conquers fire (by extinguishing it);
- Fire conquers metal (by melting it);
- Metal conquers wood (by cutting it);
- Wood conquers earth (with its tap root).

In his scheme, the current dynasty, the House of Zhou, was correlated with the phase of fire. So the succeeding dynasty would be governed by the phase of water, which extinguishes fire. As the master of *wuxing* theory, and therefore perceived to be the person most likely to know
which ruler accorded with what element, Zou Yan was the favorite of every hegemonic power seeking to seize the Mandate of Heaven from the declining Zhou dynasty. Under the patronage of some of the most powerful kings of the Warring States, Zou was able to refine his theories and disseminate them widely.

The Correlative Universe

Following upon the popularity of Zou Yan’s system, wuxing theories became very nearly universal. Every conceivable structural relation reducible to a factor of five was now correlated with the five phases. Red is the color of fire, yellow is the color of the soil of the Central China Plain, foliage is green, deep water is black, and the salts of metal are white. Fire rises, and feathered creatures fly up, so birds are correlated with fire. Water sinks, and shelled creatures dive down. Vegetation sheds its leaves and goes dormant in the winter, and scaly creatures shed their skin and hibernate, and so on. In similar fashion, the sense organs and internal organs of the human body, agricultural products, and land animals, for instance, are all correlated with the five phases. With these associations established, the production and conquest orders of the phases are then keys to properly affecting the natural process of particular organisms and organs. For example, when the five internal organs (spleen, lungs, heart, kidney, liver) are correlated with the five phases, wood governs the liver. When the five grains (rice, millet, barley, wheat, legumes) are correlated with the five phases, legumes belong to the element water. In the production order of the phases, water nourishes wood, so a diet rich in soybeans can be beneficial to the liver.

Five Principles of Peaceful Coexistence ▶
Five Principles of Peaceful Coexistence

Hépíng Gòngchǔ Wǔ Xiàng Yuánzé
和平共处五项原则

Originating in talks between China and India regarding Tibet in 1953 and 1954, the Five Principles of Peaceful Coexistence include mutual respect for sovereignty and territorial integrity, mutual nonaggression, noninterference in each other’s internal affairs, equality and mutual benefit, and peaceful coexistence. More than fifty years later the principles still apply to maintaining relations in Asia and around the world.

Scholars of Chinese foreign policy define “peaceful coexistence” as the slogan that guided Chinese foreign policy between 1953 and 1957, the years that followed a “communist internationalism” phase (1949–1952) and preceded a “militant anti-imperialism” phase (1958–1965), and which then climaxed with the Great Proletarian Cultural Revolution (1966–1976), broadly coincident with the Maoist period in China’s foreign policy.

Even so, the Five Principles of Peaceful Coexistence are still upheld in modern China and have been embraced by countries around the world. The principles include (1) mutual respect for sovereignty and territorial integrity, (2) mutual nonaggression, (3) noninterference in each other’s internal affairs, (4) equality and mutual benefit, and (5) peaceful coexistence.

Zhou-Nehru Discussions on Tibet, 1953–1954

Scholars date the Five Principles, also known in India as the “Panchsheel,” back to December 1953–April 1954 when complex negotiations took place in Beijing between

834
China and India regarding China’s invasion of Tibet in 1950, an act that exacerbated age-old territorial issues between the two Asian giants. India had been one of the first countries to recognize the People’s Republic of China (PRC), and now Beijing sought India’s recognition of China’s suzerainty (dominion) over Tibet. The Five Principles were formally written into the preface of the Agreement between the PRC and the Republic of India on Trade and Intercourse between the Tibet Region of China and India. Whether the formula was first proposed by Premier Zhou Enlai of China or by his Indian counterpart, Prime Minister Jawaharlal Nehru, remains obscure, but it is certain that both agreed. It is certain, however, that the Five Principles would influence opinion on the situation on Indochina that was developing April 1954.

**Zhou-Nehru Discussions on Indochina, June 1954**

As the Geneva Conference on Indochina commenced in April 1954, Zhou went to pains to portray China as a nonaggressive country. Nehru was no less concerned over peace in Indochina, and the coincidence of views between India and China over Vietnam led Zhou to visit India after the conference where, in a joint communiqué
issued 28 June 1954, Zhou and Nehru elaborated on and advocated adherence to the Five Principles. The two sides urged neutral status for South Vietnam, Laos, and Cambodia. On this occasion they jointly supported noninterference. Zhou then visited Myanmar (Burma), where he and Prime Minister U Nu reiterated the Five Principles. India and China apparently were broadly reacting to the U.S. policy of containment leading to the creation in September 1954 of the anti-Communist United States/United Kingdom–backed Southeast Asia Treaty Organization (SEATO), an organization that included such pro-Western nations as Pakistan, Thailand, and the Philippines.

At a rally held on 26 June 2004 to commemorate the fiftieth anniversary of the Five Principles, Premier Wen Jiabao of the PRC made a speech that paid tribute to Zhou and Nehru as the elder statesmen whose advocacy of the Five Principles of Coexistence made a contribution to diplomatic relations among nations of the world.

The Five-Anti Campaign 五反運動, launched in 1952, was a nation-wide movement aimed at eliminating bribery, theft of state property and economic information, tax evasion, and cheating on government contracts by private enterprise and capitalists. The campaign succeeded in consolidating the government’s control over the economy, which facilitated the country’s transition to socialism.

On 26 January 1952 the government of the People’s Republic of China (PRC) launched the nationwide Five-Anti Campaign to eliminate the corrupt practices of privately owned enterprises and capitalists. These corrupt practices were identified as the “Five Evils”: bribery, theft of state property, tax evasion, cheating on government contracts, and stealing of state economic information. These evils were considered detrimental to the national policy of rapid economic recovery and reconstruction. However, the Five-Anti Campaign was not a mere rectification movement in the economic sphere but rather carried deep ideological, political, and social implications.

After its founding in 1949 the PRC government had been confronted with the task of rehabilitating the national economy, which was severely damaged by the War of Resistance against Japan and the Chinese Civil War. Realizing that the majority of national assets and resources were in the hands of private capitalists, the government did not eliminate them for the Communist cause. Rather, the government permitted their existence and recognized their importance in engineering the rapid recovery of China. This policy, however, did not mean that the government would leave the private sector intact, as it had before 1949. According to the Chinese Communist ideology of “New Democracy,” the continued existence of private capitalism was a preliminary step in preparing the country for the ultimate transition to socialism. In the meantime the state would restructure the national economy by gradually placing all economic activities under state control. The Five-Anti Campaign was the first step toward accomplishing this goal.

Mass mobilization was the main tactic employed to eliminate the “Five Evils.” Party cadres, government officials, mass media, and ordinary citizens, especially the workers, were encouraged to criticize and expose the malpractices of privately owned enterprises and business leaders. Accused persons were tried in public and made repeated confessions, unleashing a brief reign of terror. By awakening the class consciousness of the workers, elevating their position vis-à-vis the capitalists, and demolishing the private capitalists, the government intended to consolidate the ideal of the people’s democratic dictatorship, from which the Chinese Communists had consistently drawn legitimacy for their leadership role before and after winning power.

Moreover, the Five-Anti Campaign was an intellectual and educational reform. Besides corrupt capitalists, the campaign targeted such traditional evil habits as drug use, gambling, and prostitution. With this campaign the government intended to reeducate and rectify the entire population so as to cultivate a utopian society.
The Five-Anti Campaign came with a price. Workers’ confrontations with their employers invited such retaliations as firings, withholding of wages and jobs, and wage reductions. Four months after the campaign began, unemployment and underemployment rose to 1.5 million, which was 1.5 times the pre-campaign figure.

Despite the economic and psychological setbacks, the Five-Anti Campaign, formally ended on 26 October 1952, was considered important. First, it eliminated the “Five Evils” and brought the privately owned enterprises under state guidance. This success encouraged the government to move beyond New Democracy and to embark on the transition to socialism, beginning with the Five-Year Plan in 1953. Second, the campaign reinforced the top leaders’ belief that mass mobilization and rectification were effective means to serve their interests. After 1952 a number of mass campaigns followed, among which the Cultural Revolution (1966–1976) was the most significant and disastrous.

Five-Yuan System

Based on Sun Yat-sen’s (1866–1925) idealistic model of the new republic that was introduced to replace the ancient Chinese imperial system, the five-yuan (five branch) system of government was adopted under the Guomindang (GMD) in 1928 for China and remains the basic polity for today’s Taiwan.

As the Qing dynasty (1644–1912) in the late nineteenth century became increasingly impotent to handle both international and domestic crises China faced, some Chinese elite began to take radical actions against the Qing government and also search for an alternative polity to replace the Chinese traditional imperial system.

Sun Yat-sen (1866–1925) was the most prominent leader of this group of new elite. Born into a modest peasant family in Xiangshan of Guangdong Province, Sun obtained his Western-style secondary education in both Hawaii and Hong Kong from 1879 to 1892. In 1894, Sun founded in Hawaii the Revive China Society among overseas Chinese and in 1895 organized his first revolutionary uprising in Guangzhou. Thereafter Sun traveled to Landon, the United States, and Japan to spread his revolutionary ideas and mobilize more overseas Chinese to support his anti-Qing revolution.

In 1905, Sun founded in Tokyo the Revolutionary Alliance (which later developed to the Nationalist Party [Guomindang]) among overseas Chinese students and merchants and soon established more branches with their networks spreading over China, Europe, the Americas, Japan, and Southeast Asia. While continually mobilizing, organizing and coordinating secret society members, peasants, workers and army soldiers to launch anti-Qing uprisings in China, Sun also started to think about his “model republic” as the alternative polity to replace the Qing system.

Sun’s Five-Power Model Republic

In November 1905, Sun founded the People’s Journal monthly as the Revolutionary Alliance’s party organ. In his initial statement for the journal’s publication, Sun briefly outlined his famous Three Principles of the People—the principles of nationalism, the people’s rights, and the people’s livelihood—as an ideological pillar for his model republic. A year later, in a speech delivered to the Revolutionary Alliance’s overseas members who gathered to celebrate the anniversary of the People’s Journal in Tokyo (where the Alliance’s main headquarters was located), Sun first made public his ideas about the so-called five-power constitution (wuquan xianfa), which he considered another major pillar for his model republic.

In 1919 in Sun Wen xueshuo (The Doctrines of Sun Wen)—Sun Wen is Sun Yat-sen’s formal name while Yat-sen is his literary name—and then in a 1921 speech entitled “The Five-Power Constitution,” Sun further explained how this model would work. The five-power polity, in Sun’s view, was crucial to the realization of one of the Three Principles of the People—the principle of the people’s rights (minquan).
Originally inspired by British and American constitutional practices of the separation of power, as acknowledged by Sun himself in the 1906 speech, his model republican polity was designed to overhaul the serious flaws he saw in the Anglo-American political system. Strongly believing that a capable government was indispensable for the success of the Chinese republic, Sun realized that neither public elections nor the appointments made by a democratically-elected president could guarantee a government of capable officials; he saw in the West that elections could be manipulated and the president could appoint the people he wanted. Drawing from a long Chinese tradition of selecting officials through civil service examinations, Sun proposed to establish the Examination Yuan, the fourth independent government branch—the executive, legislative, and judicial were the other three—to handle modern civil service examinations to determine the qualifications of officials and carry out periodical evaluations of their performance, regardless of whether they were elected or appointed.

Also, having observed how the American Congress could use supervisory power to block actions of the president for pure political calculations, Sun turned to the Chinese traditional censorial system to look for a solution, proposing that the independent fifth government branch—the Supervisory Yuan—be established to supervise all government offices and officials.

The Five-Yuan System and the GMD Party-State

On 8 October 1928, the GMD Standing Committee selected Chiang Kai-shek (1887–1975) to be the chairman of the central government, and Tan Yankai (1880–1930), Hu Hanmin (1879–1936), Wang Chonghui (1881–1958), Dai Jitao (1891–1949), and Cai Yuanpei (1868–1940) to be the presidents of, respectively, the Executive, Legislative, Judicial, Examination, and Supervisory Yuans.

Key GMD leaders, such as Chiang Kai-shek, Wang Jingwei (1883–1944), T. V. Soong (1894–1971), and H. H. Kung (1880–1967) also served as the president of the Executive Yuan in different times. Sun Ke (1891–1973) was the president of the Legislative Yuan from 1932 to 1948, while Ju Zheng (1876–1951) served as the president of the Judicial Yuan from 1932 to 1948, and Yu Youren (1879–1964) was the president of the Supervisory Yuan from 1930 until his death.

Although the five yuan were created as separate government branches, they were far from being independent institutions but were closely tied with different factions of the GMD party. In 1906 Sun outlined a three-phase republic-building process: the phases of military rule, of rule under imposed laws (rephrased in 1914 as political tutelage under a revolutionary party), and of constitutional rule. The phase of political tutelage began as soon as the Nationalists took over Beijing in June 1928, which also ended the Northern Expedition. On 3 October 1928, the GMD Standing Committee passed the Guiding Principles of the Political Tutelage and the revised Organic Law of the Republic China. The Guiding Principles specified that the GMD Central Executive Committee, through its Political Council (Zhengzhi huiyi), would represent the nonexistent People’s National Congress (Guomin dahui) to exercise the governmental power.

Started as Sun Yat-sen’s personal advisory body for providing political consultations, the GMD Political Council, with Chiang Kai-shek becoming its chairman in July 1928, was reorganized as the most important formal conduit through which the political decisions of the Nationalist Party could be transformed into concrete administrative policies of the Republic. The resolution passed by the GMD Standing Committee on 25 October 1928 further specified that the Political Council was the highest party organization designated with the mission of directing the political tutelage. It was given a wide range of powers to make important state policies and laws, and appoint top government officials.

The third GMD congress held in March 1929 ratified the Guiding Principles and reconfirmed the resolution of the Standing Committee:

...the people of the Republic of China who experienced the national revolution are really babies because they only had naive political knowledge and experiences, while the GMD is the mother that reproduced these babies. Being the mother, the GMD has obligations to nourish and educate the babies... (Rong & Sun 1985, 658)

The Organic Law of the Republic China, which could only be definitively explained and revised by the GMD Political Council, also guaranteed the GMD’s leadership over the central government. It stipulated that a State Affairs
Five-Yuan System

The Council (Guomin zhengfu weiyuanhui), with a chairman and twelve to sixteen councilors, was to be established to run the central government and its five separate yuan.

In the first actual operation, Chiang Kai-shek, Tan Yankai, Hu Hanmin, Dai Jitao, Wang Chonghui, and Yu Youren (who replaced Cai Yuanpei) all were members of either the GMD Central Executive or Central Supervisory Committees; they were also members of the Political Council. It was because of their party positions that they were chosen to be State Councilors and appointed heads of the central government and the five yuan. Although the member qualifications for the Political Council and their specific ties with the GMD party and the central government changed from time to time, the basic framework of the GMD party-state had been established by the late 1920s, which encompassed the apparatus of the central government, including the five yuan.

Food safety has become a major issue in recent years as the global marketplace has expanded and consumers around the world call for imported, affordable foods. China is a major player in the international food market, but recent cases of tainted foods appearing in domestic and foreign markets have dampened consumer confidence and damaged China’s export economy.

China is the largest exporter of food products in the world, with the United States a major market. According to World Trade Organization (WTO) statistics, China’s total food exports reached $53.3 billion in 2005 (although Chinese government statistics show only $27 billion for 2006), which is about 7 times the $7.5 billion it exported in 1980. Regulation of food safety has long plagued China because of weak monitoring capacity, strong local government protectionism of industries, and few consumer-protection watchdogs. The growing safety problems with food exports—ranging

Uninspected shipments arrive from the countryside daily in private vehicles like this into to be sold in city markets during the epidemic bird flu problematic time. Even though local news report an increase in monitoring, little change can be seen.

PHOTO BY ROBERT EATON.
from food bans by the European Union (EU) and Japan to the recent melamine-tainted dog food scandal in the United States—are bringing global attention to these deficiencies and creating a unique opportunity for international partnerships to address them.

**Consumer Concerns**

Chinese consumer demands plus an explosion of negative news media attention on food exports have greatly accelerated food safety reforms, new laws, and crackdowns within China. As global trade in food has grown, so has consumer demand for food safety. For example, the food safety expert Paul Young (Waters Corporation) highlighted recent surveys in Japan and the EU that reveal consumers are increasingly willing to pay higher prices to ensure the safety of their food. Food safety is not just a concern of consumers, however, it is also important to governments and businesses to ensure the integrity of the agricultural export markets. This is a particular concern for the United States, which has historically enjoyed a favorable balance of trade with food products, but is now losing that edge as many emerging countries around the world—such as China and Mexico—are expanding their food export markets.

**Food Safety Regulation Structures in EU and Japan**

According to Paul Young, a successful food safety regulation structure must include the active collaboration of the government, food safety technology leaders, and the food industry. An effective food safety system must be comprehensive, for relying solely on testing imports is reactive and potentially expensive if done in isolation. Conversely, simply depending on a third party or exporting country to test is risky and requires monitoring to ensure tests are done well. Ideally, food safety regulations should be internationally harmonized; that, however, has not yet happened. Among exporting countries it has long been considered that the EU has the most stringent legislation. But recent Japanese legislation has matched, or even surpassed, that of the EU. Both of these systems are successful, for a number of reasons.

**The European Union**

Strengths that distinguish the EU’s food regulatory system are: (1) the regulating body—the European Food Safety Authority—an independent, scientific point of reference for risk analysis ensuring that food safety regulations are based on science; (2) a comprehensive system for traceability of foods; (3) a rapid alert system for food and feed to disseminate information on risks within the European Community; and (4) a requirement that food imported from third countries are produced and tested with the same diligence as domestic produce.

**The Japanese System**

The strengths of the Japanese system are: (1) compliance to Japan’s food safety standards is ensured through a very high level (upwards of 10 percent) of laboratory testing for imports; (2) the onus is placed on importers to prove the safety of their products by having them tested before the products are allowed to enter Japan. One of the more demanding aspects of the Japanese food inspection regulations is the large list of substances that importers must test.

**Challenges**

China’s capacity to effectively protect food quality is hampered by a weak legal, political, and regulatory infrastructure that has not forced accountability among food producers and processors. Key weaknesses in China’s food-safety governance system include strong local government protectionism of industries; a lack of a product liability law; and weak monitoring capacity of food products because of the vast numbers of small-scale food producers and processors and competition among regulating agencies. China also lacks an independent court system, which could better protect consumers and company whistleblowers. Consumer education is also lagging in part because of few consumer watchdog organizations. Chinese urbanites are now demanding safer food, but answering their demands without addressing the rest of the population may create a dual system of food safety, potentially sparking social unrest. Thus Chinese regulators must design their food safety system around China’s unique political structure.
Chinese food exporters have gained market share mainly through low prices, but these gains could diminish if the quality of goods is constantly called into question. For example, the milk scandal of July 2008—in which almost 60,000 children were hospitalized in China—affected exports of a wide range of products to many countries and regions.

China faces several key challenges as it tries to ensure food safety for its exports and domestic markets. The first challenge is the structure of China’s food system, with 78 percent of food processors having fewer than ten employees and most farms being two acres or less. The numerous small farms combined with a cash-based and large and fragmented food production system make traceability difficult.

For centuries Chinese farmers have intensely cultivated their small plots, leaving much of China’s scarce arable land depleted. Nevertheless, since the 1990s, agricultural production has grown in China thanks to an extremely high use of fertilizers and pesticides on crops and drugs in animal husbandry. It is not surprising that Chinese agricultural products are tainted by drug and fertilizer residue. It has been estimated that 40 percent of all pesticides in China are counterfeit, further compounding the problem of overapplication with doubts surrounding authenticity and actual content.

The booming Chinese economy has also created food safety challenges. Rapid economic growth has enabled a massive expansion in highways and cell phone usage, which now connect the small farms with faraway markets, further confounding traceability of food products and additives.

China’s rapid growth has created a widening wealth gap, mainly along urban and rural lines. The Chinese government has tried to help stimulate the economy in rural areas, most notably by canceling the agricultural tax and lowering other fees to encourage small business and entrepreneurship in poorer rural areas. The Chinese government faces a difficult situation when the need to protect consumers requires shutting down dangerous food processors and farms that employ the rural poor.

**Civil Society**

China’s consumers lack a strong civil society, and manufacturers do not have strong independent associations to address their collective interests in ensuring food safety. The government has further reduced incentives of the manufacturers to self-regulate by restricting news media coverage of food safety stories that might cause panic or lack of faith in the government system.

Major class action cases around food safety in China have not been seen mainly because, in cases like the recent milk scandal, the government has rapidly taken action against those responsible. In this and other recent scandals, the government has bowed to the will of “netizens”—mostly fast, anonymous, Web-savvy bloggers—and forced responsible regulators to resign. In the milk case, the head of the General Administration of Quality Supervision, Inspection and Quarantine (AQSIQ), Li Changjiang (b. 1944), was forced to resign after netizens found classified government documents and posted them online showing that AQSIQ had turned a blind eye to the developing crisis. And yet when more than 200 victims’ families took the tainted-milk case to China’s highest court to seek long-term care, some were arrested. This case caused massive mistrust of the government’s food safety initiatives.

Although China faces many challenges to ensuring the safety of its food supply, the government has set up a coordinating committee under Wu Yi (b. 1938), vice premier and former minister of health, to examine strategies for improving food safety. In 2007 the government issued a five-year food and drug safety plan and a food safety white paper and carried out campaigns to close unsafe food processors. Chinese food safety regulators are reaching out to international partners to discuss issues of mutual interest; the Asian Development Bank, for example, played a key role in the analysis and development of China’s new food safety structure.

The needs of both the United States and China to strengthen their food inspection and regulatory systems underscore the ample opportunity for collaboration between the governments and private sector companies.

Paul Young noted that China’s prospects for improving its food safety regulation are not as dismal as they may appear today. Thailand had formidable food safety problems beginning in the 1990s culminating in 2002 with the EU mandating 100 percent testing on imported poultry and aquaculture products—the country’s two biggest exports. Thailand’s problems resembled those facing China now—a fragmented food producer system with many
Food Safety ▪ Shipin anquan ▪ 食品安全

small farms and companies, in which sources of food products were difficult to trace. The solution is widely regarded as a salutary lesson in dealing with such issues. The Thai government, the food producing industry, and technology leaders worked intensely with EU regulators and international companies to fix the country’s food production and regulatory systems. Young maintained that such a rapid and effective response would not have been possible without the collaboration of the Thai government with willing partners in the Thai producers’ organizations working in partnership with technology solution providers, such as U.S.-based Waters Corporation, to build effective testing programs and production strategies.

China is increasing advertising and propaganda to encourage consumer confidence in the milk sector. PHOTO BY ROBERT EATON.
Foot-binding was a custom in which girls’ feet were bound with tight bandages so that they would grow to only about 8 centimeters long. Originally conferring femininity and social status to upper-class women, the practice spread to lower-class women seeking opportunities for upward mobility.

The Chinese custom of foot-binding, which may have originated in the court of a decadent, late-tenth-century emperor who had a fetish for small feet, spread through the country beginning at the end of the eleventh century and was common by the Ming dynasty (1368–1644). Girls between the ages of five and seven were subjected to the practice, in which their toes and heels were bound with tight bandages—usually by their mother or grandmother—so that their feet ideally would be only about 8 centimeters long. The practice made girls’ feet prone to infection, paralysis, and muscular atrophy.

Foot-binding, originally a mark of femininity and social status for upper-class women, spread to lower-class women, for whom the possession of feet resembling “golden lotuses” represented opportunities for upward mobility in the marriage and service markets.
The making of lotus shoes expressed the skills of female household labor. Despite the dangers posed by foot-binding, the practice did not keep women confined to the inner chambers. Wearing water-resistant outdoor lotus shoes, women worked in the fields, or went to shrines and temples. Foot-binding was simultaneously a symbol of feminine beauty, sexual and social hierarchy, and Confucian morality.

The Manchus, who conquered China in the seventeenth century, tried without success to abolish the practice. Later, one of the goals of the Taiping Rebellion (1851–1864) was to end foot-binding in the name of women’s equality.

By the early twentieth century Chinese reformers campaigned against foot-binding, condemning it as a source of national weakness and shame. To reformers foot-binding was seen as a symbol of China’s vulnerability to Western imperialism because the practice left a large part of the population able only to hobble. Natural feet thus became a sign of feminine beauty. By the 1920s—due to the anti-foot-binding efforts of Chinese natural-foot societies and Western women and Christian missionaries living in China, combined with criticism by May Fourth intellectuals (who favored adoption of Western science and philosophy to strengthen China), and with the practice of rewarding citizens who turned in women’s binding cloths and lotus shoes—laws were enacted that eventually ended the nine hundred-year-old custom.

The Forbidden City
Zìjīnchénɡ 紫禁城
Gùgōng 故宫

The Forbidden City, located in the center of Beijing, is the largest and most complete ancient palace in China, an unparalleled monument whose massive architecture and beauty encapsulate the Chinese notion of the unlimited power enjoyed by imperial rulers.

The Forbidden City in the heart of Beijing is an ancient architectural complex, commonly known as the “Old Palace” in China; it was the home of Chinese rulers and the seat of Chinese government for more than five hundred years.

Completed in 1420 during the Yongle reign of the Ming dynasty (1368–1644), it continued to be used by a total of twenty-four emperors of the Ming and the Qing (1644–1912) dynasties. After the last emperor Pu Yi was evicted from the former Qing palace in 1924, a museum was established in the palatial compound to house the paintings and artifacts from the imperial collections, which at that time also included items later shipped to Taiwan. The Forbidden City, as the largest and most complete ancient palace in China, was added to the list of UNESCO World Heritage Sites in 1987.

The palatial complex is located in a quasi-rectangle of 72,000 square meters (961 m × 753 m), wrapped in a wide, stone-lined moat and massive brick-colored walls with soaring corner towers showing intricate roof designs. The principal structures within the compound inherited heavily from Ming constructions, built with timber frames on stone foundations and yellow glazed-tile roofs, clearly deployed with a north-south oriented axis in mind. The buildings are physically and functionally divided into two major sectors: administrative buildings for the outer (front) court in the south and residential halls for the inner (back) court in the north. The southern court can be easily accessed through the main entrance, called Wumen (Meridian Gate), an imposing U-shaped structure opening toward the south. Its central gate tower, rising 37 meters above the ground at one end of the axial line, is the tallest structure of the entire palatial complex. The area in front of this awe-generating passageway was a prominent venue for issuing edicts and conducting ceremonies.

Immediately adjacent to the north face of the Wumen Gate is an expansive, open square (26,000 square meters) with the bow-shaped Golden Water River running through it. This man-made river flows to the outside moat and is remotely linked to the source of spring water in the outskirts of Beijing. The square is framed in the north with the Taihe (Supreme Harmony) Gate and it functions as the vestibule leading toward a three-tiered, white stone terrace, the majestic site of three principle structures of the palatial complex: Taihe Hall, Zhonghe (Central Harmony) Hall, and the Baohe (Preserving Harmony) Hall. The nine-bayed Taihe Hall has a south-facing façade of 60.01 meters wide and is the largest of all buildings within the Forbidden City as well as the largest extant timber-framed building in China. This monumental structure was a throne room for Ming emperors, but was frequently used as a ceremonial center during the Qing. Both the Taihe and Baohe Halls are designed with double-eaved roofs and distinct embellishments symbolizing imperial power. They are linked to the smaller,
square Zhonghe Hall in the middle along the line of the stone-carved Imperial Way, which also was part of the central axial line of the ancient imperial city.

Through the central passageway of the Wumen Gate, the Imperial Way projects south and merges with a series of city gates including the Tian’an (Heavenly Peace) Gate at the modern Tiananmen Square. This axial line eventually directs toward an area where the Temple of Heaven and Twin Altars of soil and grain are located. It is evident that Chinese traditional planning principles were used for the ground plan and location of the palace so as to delineate the celestial king’s pivotal position in his sovereign space.

West of the outer court inside the Forbidden City is a building for the emperors to receive ministers and hold courts, called Wuying (Military Eminence) Hall. It also is the base of Forbidden City’s own printing house, which has produced important literary works including the mammoth *Siku Quanshu* (Complete Collection in Four Treasuries), a ten-year editorial enterprise resulting from the Qinglong emperor’s 1772 edict. This project brought together all varieties of important textual materials known in the imperial collection and libraries, and eventually led to the production of the largest single assembly of Chinese classical texts. This 36,000-volume work has since remained as a major source book for different fields of Chinese studies, and it is now made available in electronic versions based on one of the original copies previously kept in the Wenyuan (Literary Profundity) Pavilion, the imperial library located immediately north of a Wenhua (Literary Glory) Hall. The latter was a lecture hall for studying Chinese classical texts and is a mirror image of the Wuying Military Hall at the opposite side of the outer court, thus balancing the civil and martial components within the compound.

The inner court in the northern part of the palatial compound is an enclosed area with a crisscross of alleys within a perimeter of 1,500 meters. The major components are three residential complexes aligned along the central axial line, which pierces through the imperial garden and

Architectural details of the Forbidden City reflect highly specialized building techniques. PHOTO BY JOAN LEBOLD COHEN.
the Shenwu (Divine Might) Gate in the northern sector of the Forbidden City and points outside toward the Di’an (Earthly Peace) Gate, and the Drum and Bell towers further north. The Qianqing (Heavenly Purity) Palace in the south of the inner court was the residence of the emperor during the Ming dynasty and the early Qing period; it later became the place for conducting state affairs, with furnishings replicating those used in the outer court. The Kunning (Earthly Tranquility) Palace in the north was the seated empress’s chamber during the Ming Dynasty, but was renovated to hold an altar for performing Manchu sacrificial rites during the Qing era. Between these two is the smaller Jiaotai (Union) Palace that functioned as a venue for the empress’s coronation and other festive occasions, and as the home of ritual paraphernalia and twenty-five Qing Imperial seals.
East and west of these three palaces are a series of self-contained courtyards and minor palaces belonging to the seated emperor’s concubines and children, in addition to the ancestral shrine in the east and the Yangxin (Mental Cultivation) Hall in the west. The latter became the emperor’s chamber starting from the Yongzheng’s reign (1722–1735). The Ningshou (Tranquil Longevity) Palace in the northeastern sector of the Forbidden City, built for Qianlong Emperor’s retirement (1795), is also remarkable. Its courtyard features an outer court and an inner court to emulate the principal setup of the Forbidden City, and it is furnished with complex recreational facilities and innovative landscaping designs. A colorful glazed-screen wall at its entrance, representing nine animated relief dragon figures, is one of the most conspicuous items of the Forbidden City. Inside the inner court of the entire palatial compound are religious settings in which to perform Buddhist, Daoist and Lamaistic, as well as Shamanistic, rituals. They attest to the liberalism in Qing religious practice.

Over the course of five centuries, some of the buildings within the Forbidden City were razed or plundered, while renovations and new addition also were been made. Nevertheless, distinct features and the original layout of the principal buildings remain discernible up to this day. The ground plans, designs, color schemes, building orientations, and names of these architectural structures clearly were made in accordance with principles prescribed in ancient texts of Grand Rituals and Yin-Yang correspondences essential for the dwellings of the emperors. These visual forms interpret traditional Chinese cosmological views regarding the terrestrial existence of celestial kings, known as “sons of heaven.” The architectural structures also bear witness to highly specialized crafts and technologies accomplished during the Ming-Qing era (1368–1912), ranging from stone carving, textile designs, ceramic productions, metalworking, and engineering for heating, water supply, and drainage systems—tangible evidence of synthesized cultural refinements and technological inventiveness originating from China and peripheral regions. They provide important clues for studying the concept of Mandate of Heaven in Chinese sovereign rule that had perpetuated for than five thousand years.

Foreign Investment

China is a major destination of international investment. Approximately 80 percent of the total realized foreign investment was direct investment, of which most came from Hong Kong, Japan, the United States, Taiwan, Singapore, and the Republic of Korea. Foreign direct investment in China concentrates in manufacturing, especially in garment, textile, electronic, electrical, and chemical industries. Most of the foreign manufacturing investments in China are export producers. Together they contributed about 57 percent of the value of China’s merchandise exports in 2007. In non-manufacturing activities foreign investment in China concentrates in real estate, retail trade, hotels and restaurants, and business services.

China provides foreign firms three major modes of direct entry—the wholly foreign-owned enterprise, the equity joint venture, and the contractual joint venture. Wholly foreign-owned enterprises are investments solely controlled by foreign firms, whereas equity joint ventures and contractual joint ventures are Chinese–foreign collaborations with control rights defined by equity proportions and by contractual terms, respectively. The establishment and operation of these three major modes of investment are governed by specific Chinese laws. These laws include the Law of the People’s Republic of China on Wholly Foreign-Owned Enterprises, the Law of the People’s Republic of China on Chinese–Foreign Equity Joint Ventures, and the Law of the People’s Republic of China on Chinese–Foreign Contractual Joint Ventures. Together these three laws constitute the mainstay of China’s policy framework for foreign investment. Other major Chinese laws and regulations for foreign investment include the Enterprise Income Tax Law of the People’s Republic of China, the Labor Contract Law of the People’s Republic of China, and the Catalogue for the Guidance of Foreign Investment Industries.

China’s policy framework for foreign investment has undergone necessary evolution and has become relatively liberalized in recent years. Prior to entry to the World Trade Organization (WTO) in 2001 but especially in the first decade of the economic opening beginning in 1979, China generally emphasized joint venture forms of investment and restricted foreign firms from using corporate takeovers to enter the Chinese market. Today foreign investors face few ownership and location restrictions and can employ more systemic investment strategies in China.
industries such as banking and wholesaling-retailing that could have an impact on immediate national economic stability. They were not allowed to establish ventures in places outside the special economic zones (SEZs) in south China and the open cities along the coast, except for those locations in which their Chinese venture partners were already situated. Today foreign firms can invest in China through acquisition and merger. They can invest in most industries in China without ownership and location restrictions. In 2007 approximately 77 percent of the realized amount of foreign direct investment (a 66 percent increase compared with 1989) was wholly foreign-owned investment, and about one-third of that amount (a 15 percent increase compared with 1989) agglomerated beyond Guangdong in Shanghai and Jiangsu Province.

Ownership and Location Choices

Foreign firms exploit the recent liberty of full ownership in China for exclusive control of their investments there. They can better relate their wholly owned subsidiaries in China to their corporate networks there and elsewhere in the world. Full ownership is generally viable for investments that cater to the home or third markets of foreign firms. They are applicable for investments that involve only the assets of foreign firms. Full ownership, however, is usually less viable for investments that focus on such China markets as automotive and real estate, which have restricted access to certain business channels. Foreign firms penetrating these markets in China may require participation of local partners possessing relevant access privileges. Under these circumstances foreign firms may face business goals and management practices that diverge from those of their local partners. They may have greater difficulties in aligning their joint ventures in China with the rest of their corporate activities.

On the other hand, since the early 1990s foreign firms can opt to locate in regions beyond the special economic zones and the open cities and extend their corporate networks and market reach in China. Numerous designated areas for foreign investment across China have come into existence to facilitate this development. These areas are of many types, including economic and technology development, free trade, and export processing zones of varied focus: economic and technology development zones concentrate on manufacturing investments, for example, and free trade zones on nonmanufacturing activities. These designated areas also vary in providing local incentives for competing foreign investors. Foreign firms can therefore negotiate with the authorities of their preferred zones to obtain optimal incentives. The major local incentives for which foreign investors can negotiate include a tax-holiday extension beyond the national standard of full exemption of enterprise income tax (25 percent for most enterprises
and 15 percent for advanced technology enterprises by 2012) for the first two years after an investment becomes profitable, and half exemption of the tax for the next three years. The incentives also include fee reductions, of which those for land use and public utility are most common. In general, the more important an investment is to a zone, the larger is the extent of local incentives to that investment.

The designated areas further vary in administration level and the quality of support they provide. Zones that are designated at a national level generally adhere more strictly to state-established policies, are better connected to central government authorities, and provide superior physical infrastructures for foreign firms. They are more suitable for foreign investments that demand formal institutional governance, high-level bureaucratic relations, or industry-standardized facilities. These national-level zones are therefore preferred by Japanese, U.S., and European firms for major undertakings, especially those that are technology- or knowledge-intensive or are oriented to China markets. As such these investments usually
assemble in major cities where national-level zones are concentrated. They are drawn to the greater Shanghai area and the greater Beijing-Tianjin area, where highly skilled workers and major markets congregate. Japanese investments flock especially to the greater Beijing-Tianjin area because of shorter distances and the existing locations of networked firms from home. Investments from the United States are nevertheless geographically more dispersed. U.S. firms are more active than their Japanese and European peers in exploring investment opportunities beyond the major coastal areas in China.

By comparison, zones that are designated at a provincial or local level are generally preferred by investors from Hong Kong and Taiwan. Unlike their advanced-economy counterparts, firms from these two places demand mainly good local relations and usable infrastructures because they undertake primarily small and medium investments in labor-intensive export production. Hong Kong and Taiwan investors therefore usually rely on their personal and kinship ties (guanxi) in China to navigate in these more relations-based settings. They utilize their social and cultural heritages to operate in these more informally governed environments. As a result, investments from Hong Kong and Taiwan concentrate in many former county areas (now cities) in Guangdong and Fujian Provinces where their ties are most strong. They concentrate especially in the Pearl River Delta, where communications with their Hong Kong offices are convenient and where major container ports are located. But as wages and other operating costs in the delta have continued to rise in recent years, Hong Kong firms have begun to relocate some of their investments to the inland areas in Guangdong and to the provinces in central and southwestern China. Taiwan firms have also begun to relocate some of their investments, especially to southern Jiangsu and northern Zhejiang provinces where they similarly have close personal and kinship ties. In 2007 the average monthly base wage of a manufacturing-plant worker in the Pearl River Delta reached approximately $200, which nearly doubled that of central or southwestern China. The major expenditures for benefits, which amount to at least 30 percent of the total payroll of an enterprise, cover mandated insurance (old age, medical, unemployment, work-related injury, and child bearing), housing, and employee meals.

Information on most major designated zones and on regional economic conditions in China is readily available today through the development corporations and management commissions of the zones and through the foreign investment and trade organs of municipal governments. Most of these organizational entities have an Internet presence, and some of them have representative offices overseas. Information on individual investment opportunities, on the other hand, is more readily available at fairs for foreign investors and in consulting services that cater to them. Data and advice are also increasingly available through the customers, suppliers, and other affiliated businesses of the investing firms that have local business knowledge in China. In recent years, foreign firms, especially those from Japan, North America, and western Europe, usually

A little girl sips her first can of Coca-Cola through a straw. The two big cola companies fight for the hearts of Chinese consumers now as heartily as they fought for the loyalty of American consumers. PHOTO BY JOAN LEBOLD COHEN.
conduct detailed portfolio analyses when considering major investments in China. They assess the suitability of a zone before finally deciding to locate their business there. In general, the founding of a foreign-invested enterprise in China requires approval from relevant authorities on a project proposal, a feasibility study report, a contract (for joint ventures), articles of association, and a certificate for establishment. A foreign-invested enterprise, along with all local enterprises in China, further requires a license to operate a business.

**Personnel Management and Sales and Purchases Operations**

Foreign firms usually operate their investments in China with overseas personnel in key management positions there. These overseas personnel normally comprise the native nationals or native residents of their respective home countries or territories, but the expatriates in North American and European investments can include naturalized nationals, especially those of Chinese descent, from home or third countries or both. The use of foreign nationals of Chinese descent enables North American and European firms to better adapt their operations and cultivate their relations in China. The number of overseas personnel can range from several to more than a dozen in the first years of operation, but it usually declines when an investment is firmly established. The hiring of Chinese nationals to replace expatriate personnel in key management positions is common in established foreign-invested enterprises. Nevertheless, for major joint-venture investments where Chinese partner(s) actively exercise their equity rights, foreign firms may need to maintain a stable expatriate presence beyond the first years of operation. Today foreign investments in China can recruit Chinese workers through company web pages, local advertisements, and employment fairs. They can also recruit Chinese workers through local government employment service organizations, public employment agents, and private human resources firms. The white-collar workers in foreign investments in China have generally come from local urban areas and other cities, whereas the blue-collar workers usually have come from nearby rural places and neighboring provinces. Foreign firms in China can fire workers of their own accord, but they need to inform relevant local authorities of their actions and to compensate for the affected workers in accordance with China’s labor laws. The Labor Contract Law, which came into effect in 2008, requires all firms in China to have written contracts with their workers and to provide severance pay to dismissed workers.

The localization of key and other management personnel is a strategic measure used by foreign firms to better develop or penetrate the markets in China. Today foreign firms can establish extensive networks of licensed agents, sales outlets, and service centers in China. They can foster relations with Chinese firms whose privately owned distributors and marketers reach out to the national market. Foreign investments that focus on China markets are therefore generally autonomous in managing their China sales (i.e., host sales) activities, and their China marketing departments can be sizeable. The host sales relations of foreign investments in China can nevertheless be volatile. Foreign investments targeting final consumable markets in China have faced increasing price pressures in recent years, while those focusing on durable industrial-goods markets must look for new customers on a constant basis. Foreign investments may also encounter various transaction issues with local Chinese clients when simplified contractual terms, which are usually preferred by the latter, are used. These investments may suffer from accounts receivable problems because of the differing business practices of local customer firms. By contrast, foreign investments that focus on intermediate goods markets in China can have relatively stable host sales relations. The affiliations that foreign supplier firms have with networked foreign lead firms promote such stability. Foreign investments that focus on world markets similarly have stable export sales relations. These investments sell mainly to their home headquarters, Hong Kong offices, or other Asia-Pacific offices for global accounts management and transfer-pricing reasons. In particular, most Japanese investments sell almost exclusively to their home headquarters.

The investments of foreign intermediate-goods producers have made available many sophisticated materials, parts, and components that would otherwise not exist in China. They complement the growing number of Chinese enterprises providing a broad range of general supplies.
to local firms. Foreign firms can therefore procure most of their intermediate inputs and supplies in China. They generally have autonomy in identifying local suppliers and in purchasing from those suppliers who meet the quality-control standards of their home headquarters. The level of China or host purchases is high for investments in such industries as automotives, which have local regulations about the parts used in manufacturing, and for investments that focus on China markets using local quality-control standards. Foreign investments usually purchase from suppliers located in the same region for logistical efficiency. They sign annual or long-term contracts to ensure the supply of their major intermediate inputs from Chinese sources. The increasing competence of local Chinese suppliers further enhances the overall stability of host purchases relations, although quality and delivery reliability can still raise issues of occasional concern. The relative stability of host purchases relations allows foreign firms to transfer more systematically to their local suppliers certain technical and management know-how. It facilitates the research-and-development (R&D) relationships between foreign investments and their local suppliers as they seek to improve certain product and processes. The import-purchases relations of foreign investments, which entail primarily core intermediate inputs from home headquarters or sister units or from overseas networked firms, are stable. Such purchases are managed mainly by home headquarters. They can be integral parts of the global supply chains of the multinational corporations.

Local Authority Relations and China Market Development Strategies

The localization of many areas of operations, including strategic management and key purchases, generally enables foreign investments to establish harmonious relations with the local authorities with whom they interact in China. Such harmonious relations can help foreign firms to receive expedited services, including customs clearance and utility provision when needed. They can also help foreign investments to acquire some flexibility when complying with local workplace safety and other regulations. To maintain harmonious relations foreign firms usually participate in the activities held or sponsored by local authorities. These activities include business meetings with local officials, investment seminars by zone and
municipality authorities, and ceremonies of government organizations. Foreign investments can further develop their relationships with local authorities by partaking in community events, including local celebrations, social services programs, and fundraising gatherings. With increasing salary and anticorruption awareness of government officials, foreign investments in China generally allocate expenditures for developing and maintaining these relationships, the cost of which might be higher in local-level zones and rural areas.

The increasingly normal business environments in China have allowed foreign firms to employ more systemic investment strategies there. Foreign firms, especially large firms, have gradually established their wholly owned head offices primarily in Beijing or Shanghai to facilitate their relations with high-level government offices and to service their investments in China. A growing number of foreign firms also use their China head offices to centrally manage the marketing and sales activities of their investments or to plan and finance new investments, including R&D centers, in China. Most of the foreign-invested R&D centers in China perform applied activities, that is they improve upon the designs and specifications developed by home headquarters or overseas sister units for the markets in China. Nevertheless, some of these centers are the sole R&D facilities of divisions of multinational corporations that produce exclusively or almost exclusively in China. Foreign firms further gradually optimize their corporate configurations in China by converting joint ventures to wholly owned subsidiaries, consolidating existing operations, and by acquiring and merging with other foreign investments and Chinese enterprises. They adopt specific positions, corporate functions, and global value-chain practices in their investments in China wherever appropriate.

Foreign investment has played a pivotal role in the technological and economic transformations of China since 1979. Joint-venture investments, especially those established during the first two decades of the economic opening, have been a primary vehicle in the transfer of contemporary technologies and related know-how to partnering Chinese enterprises. These and other foreign investments have also been crucial in the diffusion of the latest product ideas, advanced management techniques, and international business practices to local Chinese managers and practitioners. The accumulation of such knowledge and the subsequent application of it by local entrepreneurs have partly helped the rise of new state and Chinese private firms, of which some have become multinational companies themselves in recent years. Together these Chinese firms augment the many choices that foreign firms can pursue in providing products for consumers and the many channels through which they can operate their enterprises in China.

Foreign investment heightens price competition in the markets and enhance consumption welfare of society in China and has further sustained the demand for various goods and services in China by employing tens of millions of local workers at attractive salaries. It has financed in part the economic development efforts of local and national governments in China through tax contribution and a consistent foreign trade surplus. The joint forces of foreign firms and the Chinese state have created a new economic landscape and contemporary social culture in China’s cities and coastal areas. The force of foreign investment in shaping society, including that of the inland areas of China, will continue in the future. Foreign investment will continue to play an indispensable role in China’s quest for world economic and political leadership in the “China century.”

Biography of Sir Robert Hart

SIR ROBERT HART, Bart. (1835- ), Anglo-Chinese statesman, was born at Milltown, Co. Armagh, on the 10th of February 1835 … From the first Mr. Hart gained the entire confidence of the members of the Chinese government, who were wise enough to recognize his loyal and able assistance. Of all their numerous sources of revenue, the money furnished by Mr. Hart was the only certain asset which could be offered as security for Chinese loans … Thrice only did he visit Europe between 1863 and 1902, the result of this long comparative isolation, and of his constant intercourse with the Peking officials, being that he learnt to look at events through Chinese spectacles; and his work, These from the Land of Sinim, shows how far this affected his outlook. The faith which he put in the Chinese made him turn a deaf ear to the warnings which he received of the threatening Boxer movement in 1900. To the last he believed that the attacking force would at least have spared his house, which contained official records of priceless value, but he was doomed to see his faith falsified. The building was burnt to the ground with all that it contained, including his private diary for forty years. When the stress came, and he retreated to the British legation, he took an active part in the defense, and spared neither risk nor toil in his exertions. In addition to the administration of the foreign customs service, the establishment of a postal service in the provinces devolved upon him, and after the signing of the protocol of 1901 he was called upon to organize a native customs service at the treaty ports.

China is the third largest trader in the world; its exports in 2007 were 80 times what they were in 1979. Computer and office equipment, apparel, textiles, and consumer goods are all mainstays of China’s foreign trade, which has led to rapid economic growth in China and increased consumption of Chinese goods worldwide.

China’s rapid ascent from the rank of twenty-seventh-largest world trader in 1979 to third largest in 2004 underscores the nation’s emerging economic and political power. In 2007 China exported $1.2 trillion (an eighty-fold increase compared with 1979) and imported $956 billion (a sixty-three-fold increase compared with 1979) worth of goods. It maintained its record of a consistent surplus in foreign merchandise trade that was set forth in 1994.

Foreign Trade Composition and Regime

In 2007 nearly 43 percent of China’s exports, which comprised primarily the top three export commodities (computer and office equipment, wearing apparel, and textile products), went to the three largest markets—the United States, Hong Kong, and Japan—whereas approximately 35 percent of China’s imports, which comprised primarily the most important import commodities (electronic parts and components consisting mainly of integrated circuits, micro-assemblies, and liquid crystal devices), came from the three largest sources—Japan, the Republic of Korea, and Taiwan. The export of finished goods made of imported bonded materials and intermediate inputs—the processing trade associated mainly with the export production investment from the four Asian Tigers (South Korea, Hong Kong, Singapore, and Taiwan) and Japan—therefore constitutes the primary component of China’s foreign trade. In 2007 this type of trade accounted for approximately 45 percent of China’s total value of merchandise exports and imports. The other major exports in 2007 included steel products, whereas the other major imports included crude petroleum oil and mineral ore.

The Foreign Trade Law of the People’s Republic of China and the Customs Law of the People’s Republic of China form the base of China’s policy framework for foreign trade, which has become relatively liberalized in recent years. During the economic opening period prior to China’s entry in the World Trade Organization (WTO) in 2001, China exercised quota and licensing controls over its export and import activities. It largely had a state monopoly on its general foreign trade (import of goods for domestic sale and export of goods made of domestic materials). Foreign investments during that period were permitted to engage only in processing trade and in general import trade in which the investments themselves were the end users of the imports. Following its WTO commitments, China now uses tariffs and exchange rate adjustments to govern most of its foreign trade, and all enterprises and individuals in China are allowed to...
undertake export and import activities. Thus, now foreign firms can export to China through many channels, including trade agents at home, importers in China, and their trading or commercial investments in China. Foreign firms can also sell the products they make in China in the domestic market there.

In mid-2008 China had an average tariff rate of 9.8 percent on general imports. The average import tariff rate on agricultural products was higher at approximately 15 percent, and that on industrial goods was lower at about 9 percent. China further has a value-added tax up to a maximum of 17 percent on the increased value of most imports made at every stage of domestic sale. Certain general imports, such as equipment for manufacturing uses in innovative industries that have technology and know-how transfer potential, are nevertheless exempt from tariffs or value-added tax or both. With the exception of a limited number of goods such as iron and steel products, China also has zero tariffs on its exports. It further rebates the value-added tax that enterprises paid for their processing imports. However, as a means of moderating its foreign trade surplus, in recent years China has reduced the number of value-added tax rebates extended to merchants.

**Foreign Trade Surplus**

The import and export of food products, drugs, and a number of genetically modified goods are subject to China’s registration or certification requirements or both. The
import of certain mechanical, electrical, and electronic products is subject to the China Compulsory Certification requirement. Information on the latest regulations on China’s import and export trade can be found at the website of the Ministry of Commerce of the People’s Republic of China and that of China Customs.

Free Trade Agreements and International Economic Relations

Given its economic significance, China is at the center of the emerging Asian Free Trade Area, the trading bloc that parallels the European Economic Area and the North American Free Trade Agreement area. In 2008 China already had free trade agreements with several Asian economies, including Hong Kong, Macao, the Republic of Korea, Association of Southeast Asian Nations (ASEAN) member nations, Pakistan, Sri Lanka, and Bangladesh. China has also recently entered into a free trade agreement with New Zealand and is seeking similar arrangements with Australia. In particular, the Closer Economic Partnership Arrangement allows tariff-free flow of a wide range of local-origin goods between China and Hong Kong. It further allows firms in Hong Kong to invest in a number of services sectors that are beyond those committed to by China for its entry to the WTO. As a result, Hong Kong has reinforced its status as the most important gateway for both China’s foreign merchandise and China’s foreign services trade.

Employment and Income Growth

Foreign trade has been a major force in China’s employment and income growth since the economic opening. Such growth has not taken place at the expense of manufacturing jobs in North America and Western Europe, where firms benefit from the export of quality materials and parts, production equipment, and advanced technology products to China. Such growth also did not cause net job losses in the four Asian Tigers and Japan, where firms flourish on China’s processing or services trade or both. The growth of China’s foreign trade has further contributed to a substantial increase in consumption welfare in China, where the population enjoys a wide array of imported goods, and in the rest of the world, where people enjoy affordable Chinese exports. Nevertheless, China’s rapid ascent in the world trade arena has occasionally heightened economic and political tensions between China and its major trading partners, especially the United States and the European Union. Intellectual property protection and labor rights in China, along with the value of Chinese currency, are among the most frequently raised issues that China has faced. Notwithstanding these tensions, as the most populous nation and an active participant in the global economy, China is destined to be the largest world trader.

In the distant past, the vast majority of China’s territory was forested, but much was lost due to over-use and neglect—especially during the past hundred years. Only now are efforts underway to correct decades of abuse, and only because environmental problems such as wind and water erosion, dust storms, and desertification grew so severe that action had to be taken.

Few natural resources are as important to a nation’s industrial production and environmental quality as forests and their products. Recent attention to China’s environmental problems has understandably focused on the negative effects of three decades of double-digit economic growth and the growing resource demands levied by 1.33 billion persons. Simply feeding such a population presents the government with a staggering responsibility, one with grave consequences to the nation’s land and water resources. Growing consumption of wood, especially roundwood (timber, as compared to processed or chipped wood products), has been driven by China’s ever-expanding role as the “world’s factory” and by the rise of a new middle class seeking better-quality wood housewares and furniture. In 2006 Chinese factories turned out a staggering 130 million pieces of furniture worth $60 billion. In short, few materials are as essential to China’s “economic miracle” as wood, and as a consequence China, a major player in the global market both as importer and exporter, is establishing a strong regional presence within the roundwood markets of Southeast Asia and Africa.

Despite significant increases in imports since 1978, demand for wood and other forest products has placed considerable pressure on China’s forest areas, estimated in 2003 to be fifth among all nations at 284.9 million hectares. About 60 to 65 percent of this area is estimated to be “natural” forest. Estimates of China’s forest coverage range from 15 to 18.2 percent of national territory. The figure represents marked improvement over 1949 and 1962, when the percentages of national territory covered by forest were estimated at 8.6 percent and 11.8 percent, respectively. The State Forestry Administration (SFA) reported that in 2006 China’s forest sector earned 900 billion yuan ($118 billion). The reported 2010 goal is 1.2 trillion yuan ($150 billion), and evidence suggests that this goal may be surpassed.

Since 1950 successful efforts to protect and restore forest environments throughout China have been occurring with little foreign recognition. The National Natural Forest Protection Project (NNFPP) initiated in 2000 will see 96.2 billion yuan ($12.6 billion) invested in a ten-year project with two major goals. The first is to “protect 61.1 million ha. [hectares] of natural forest in the upper and middle reaches of the Yangtze [Chang] and Yellow [Huang] Rivers by reducing 12.4 million m³ of commercial logging each year and by afforestation of 8.67 million ha. by 2010. The second major goal of this project is to effectively control and protect 33 million ha. of targeted state-owned forests by reducing annual commercial
logging on these lands by 7.52 million m³" (Cohen, Lee, and Vertinsky 2001, 7).

In China logging in traditional but slow-growth northern forests is declining in importance, and the management of old-growth forests (virtually all now protected to some extent) has improved dramatically. At the same time new commercial forest areas and tree plantations are being developed throughout southern China, an area with a longer growing season and greater water resources characteristic of commercial forest areas in other nations. New commercial varieties of trees have been introduced—not only for roundwood but also for low-cost paper pulp. China is second only to the United States in book publishing—and many U.S. publishers now have books printed in China because of lower labor and paper costs.

Beyond commercial forests, ecologically important forests that serve as shelterbelts and future buffers against encroaching deserts and degraded grassland have also received massive increases in both forested area and investment. Forests are made up of more than trees, and hundreds of forest biopreserves have been established throughout China, particularly in west-central and southwest China. The subtropical mixed evergreen/deciduous broadleaf forests and complex rain forests of these regions are home to a greater number of endangered flora and fauna. The growing importance of tourism in “natural areas” throughout China, particularly in the southwest, has been an important argument sustaining local support for the protection of forested areas. Given China’s huge rural population, local promotion of the economic benefits of preservation and sustainable forestry has been an important propaganda challenge to ecologists, forest ministry officials, and others seeking to protect forests from unsustainable practices and to gain local support for new programs and techniques.
National Planning, Local Action

Forest protection in China is in constant competition with economic interests because of demand not only for products but also for employment. Many of China’s major forest areas are located in remote areas with few alternative job opportunities. Gaining genuine local support for forest protection and reforestation in China depends on promoting strategies that offer the promise of some economic return for participation in these efforts.

Controlling point-source pollution (pollution discharged or emitted from an identifiable source) resulting from unscrupulous factory managers, municipal waste water plants, or power stations that lack the resources to properly treat waste water or airborne particulate matter, by no means the most complex factor in forest protection and reforestation, is still an important aspect. Solving such pollution problems often depends on garnering the support of political factions and enforcing regulations. In controlling point-source pollution the middle class also plays a role, especially in urban areas where citizens are increasingly demanding cleaner, healthier environments. In addition to the large numbers of government personnel, at least 2,500 nongovernmental organizations have been formed in response to environmental concerns. Most of these organizations are located in urban areas with more educated and wealthier activists who are quickly learning how to “work the system” and get results.

In contrast, the most severe land-extensive environmental problems (deforestation, desertification, arable land degradation, erosion) are largely found in rural areas—especially those throughout China’s dry northern and northwestern provinces and autonomous regions. The idea of excluding economic use of forests on the basis on environmental protection is a relatively recent concept in China, where high population density historically assured that all environments were viewed largely (some would say “only”) as economic resources to be exploited. Most locations in China simply don’t have enough surplus land or a sufficient workforce to set these areas aside as “uneconomic” national parks or biopreserves. As a consequence, one of the greatest challenges in forest restoration and protection is squaring the circle between local and regional economic and environmental issues. Locally reforestation is recognized as an excellent means to moderate wind and water erosion and to moderate local microclimates while providing additional sources of income through the sale of “thinned” lumber or mature stands of trees.

All too often discussions of China’s environmental problems, including those related to forestry, lack a “human face.” Although rural residents of many areas with degraded or disappearing forest areas are not always poor, many are. In contrast to the urban residents in east and southeast China, these residents face different, and sometimes more immediate, environmental and economic challenges. They face them with fewer resources, less political capital, and arguably fewer options. Farmers and herders in these dry areas are no less capable; they comprehend that unsustainable activities conducted in the short term will have costly long-term effects both locally and regionally. Rural families understand the ecological messages promoted by the government, but hard lives make for hard choices. On the high, dry Loess Plateau farmers coerced to plant trees to satisfy corvee requirements (unpaid labor extracted by local governments) for a local reforestation drive may surreptitiously cut down these same trees under the cover of darkness only a couple years or even months later when the farmers lack fuel to boil water or provide heat. (Not boiling water to kill parasites could result in illness or even death for farmers and their children.)

When the World Wildlife Fund (WWF) got much of the old-growth forest within the Xiaoxing’an Mountains in northern Heilongjiang Province declared a national forest preserve, people had much to celebrate. Unfortunately, the logging ban supported by Beijing conspired with an essentially bankrupt local government, which previously derived most of its revenues from taxes on forest-product industries, to create a human tragedy—it surfaced far from the foreign press and the representatives of international environmental nongovernmental organizations (NGOs) that were party to the ban. Protection of some of China’s last old-growth forests is important, but this decision offered little solace or fiscal support to the sixty thousand laborers in Yichun who had no work, little savings, and fewer prospects. Scott Rozelle and colleagues in 2000 estimated that the nationwide logging ban that was part of the NNFPP program will cost the government $22 billion from 2000 to 2013 to reemploy or retrain 1.2
million workers shed by the shift in forest-management priorities.

China’s major forest issues can be classified as two types: commercial forestry activities and environmental protection related to forested areas.

**Commercial Forestry Activities**

Forest land in China is owned by the state but managed by county, township, or village collectives or increasingly by individual households signing twenty- to fifty-year contracts. In contrast to the land, the actual trees can be owned by the household or, if the trees are present on the land at the time of contract, are jointly owned in proportional terms by the farm household and the collective. The radically different ownership and incentive systems of the commune era (from approximately 1951 to 1976) and the reform era (from 1978 on) have left a great deal of uncertainty in the commercial forest sector that is slowly being worked out. Policies related to forestry and agro-forestry (cultivating both field crops and trees) vary dramatically by location. Crop land can be planted and harvested each year so that usufruct contracts (that ensure the legal right to use the land while the state owns it) and land transfer issues are less complicated than for forestry. Highest value trees take decades to mature, so those contract periods extend longer than for cropland, and the potential debt burden on farmers can be greater. Credit for the household can be hard to find in some areas and easily available in others. In some places seedlings are free, and fertilizer is subsidized. In Jiangsu Province a farmer willing to grow trees gets a generous stipend from the local government beyond free inputs—just so the county or township can meet its reforestation quota.

China is a major importer of forest products, particularly roundwood, plywood, and particleboard, but also exports equally significant volumes of wood-based finished products such as furniture, household products, wood and bamboo flooring, paper, and related materials. In 2006 imports of wood, wood products, paper, and paper products including paper pulp were valued at $18.4 billion, but exports were $16.8 billion; thus, imports outpaced exports by only 8.7 percent. Plywood, particleboard, and other construction-lumber imports are significant in China’s market where the domestic quality of such goods remains inferior to those of major exporters such as Canada and the United States. As more of China’s forests in the northeast are protected or limited by production quotas required by environmental regulations, many factories in Heilongjiang and Jilin Provinces were closed, but wood is now purchased from nearby Russia, a nation lacking these strict regulations.

The fastest growth has occurred in labor-intensive forest products (natural rubber, pine resin, lacquer, walnuts), the harvesting of which China’s massive rural workforce affords comparative advantage. Perhaps the most important recent trend is China’s growing role as a major importer of lumber, often high-end hardwoods, from the forest-rich nations of Southeast Asia. Natural-wood exports to China from Indonesia, Malaysia, and Thailand have grown exponentially in the last quarter century and raised prices significantly for these products. Much of this high-quality wood is re-exported as increasingly high-end furniture. The growth in the wood-products trade mirrors increases trade in many products between China and near neighbors.

**Environmental Protection Related to Forested Areas**

Activities related to environmental and ecological protection of forested areas could be grouped into two macrocategories: protection of existing forested areas and reforestation of degraded areas, particularly those in ecologically sensitive environments. Progress has been made in both areas, not only in terms of increases in protected or replanted areas but also in terms of technical support provided from the nation’s network of forestry universities, agricultural universities, and ecological research institutes associated with the Chinese Academy of Sciences and Chinese Academy of Social Sciences. More than seven hundred experimental or approved national ecological demonstration zones are charged with developing appropriate cultivation techniques and the mass production of appropriate tree species. Legislation protecting existing natural forests has also been expanded, and prosecution of violators has increased. Geographically, efforts to protect existing forests has benefited the tropical and semitropical forests of southwest China, including Sichuan Province, the Tibet-Qinghai Plateau,
the high-elevation boreal forests of far northwest China’s Altai and Tian Mountains, and the boreal forests of the northeast (Jilin and Heilongjiang provinces).

In 2006 China had 2,395 nature reserves, accounting for 15 percent of the country’s total area. In 1997, only 7.64 percent of the country’s total area was protected. Of course, not all of these areas are forested, but aside from some coastal reserves, virtually all of these reserves have significant portions in forests. The rapid increase in protected areas represents the government commitment to environmental protection of forests and grasslands. Much remains to be done because the majority of protected areas are in the west. Of the 151.5 million hectares protected nationwide, 65 percent are located in Tibet, Qinghai Province, Xinjiang Autonomous Region, and Inner Mongolia.

Reforestation of degraded forest areas has received the lion’s share of both attention and investment. Reforestation is complex, and again, even after extensive work and investment, it can fail. Areas are sometimes reforested two or three times as natural disasters (particularly droughts) render efforts inconsequential.

From 2000 to 2006 38 million hectares of forests were planted or replanted. This represents 13.3 percent of China’s total area of forested land (of 285 million hectares). Most of these forests are planted by hand—often through corvee requirements. Of particular interest are the 4.5 million hectares planted by air. Aerial planting in China dates back to the early 1950s. Of the total area reforested, 69.3 percent is classified as protected forests.

In partial contrast to the efforts to protect China’s remaining natural forests, a significant portion of which is in southwest China, much of the nation’s reforestation effort is centered on a wide band across northern China. Halting the spread of western and northern deserts, creating windbreaks on the great plains of northeast China, or reforesting land foolishly brought under cultivation during the first three decades of “new” China in Inner

A Chinese village amidst forested mountains. Photo by Joan Lebold Cohen.
Mongolia or Gansu require more than the enforcement of regulations, the fining of violators, or the closing of illegal operations.

Positive Signs

China’s rapid economic growth resulted in environmental damage of many types. The nation’s forests did not escape this damage. Still, because of the paramount attention that forest protection and sustainable forestry have received in China, progress is being made in many areas, including the protection of natural forests, the reforestation of degraded or historic forest areas, and the development of a modern commercial forestry sector. The revenues from China’s unprecedented economic growth are now increasingly used to pay for efforts to mitigate the environmental destruction of the past. This good news seems to be an overlooked aspect of foreign assessments of China’s recent environmental history. China’s forest sector, although still facing challenges, has been the recipient of massive government investment and efforts by thousands of researchers, extension personnel, rural government agencies, and officials. Far more has been achieved than most could have imagined in the mid-1980s.

48 Group Club
Sishǐ-bājiā Jítuán 四十八家集团

The 48 Group refers to a collection of individuals and companies that, beginning in the 1950s, were among the first British firms to do business in the newly formed People’s Republic of China. The “Club” of the name was added in 1991 after a merger with the Sino-British Trade Council.

The seed of the 48 Group Club was planted in 1953 by a group of British businesspeople who, along with then-premier Zhou Enlai (1898–1976), became known as the “Icebreakers” after a trip to China during which they discussed trade. Recognizing that it would be dangerous to isolate or try to ignore a great power such as China because of ideological differences between East and West, they defied the prevailing Western view of China during the Cold War by making business contacts in communist China.

In 1950 the United Kingdom was one of the first foreign states to recognize the People’s Republic of China (PRC), but relations quickly turned hostile because of the war in Korea. In 1951 the United Kingdom joined in a U.S.-led embargo on the sale to China of goods of strategic importance. In 1952 Lord Boyd-Orr (1880–1971), the first director of the U.N. Food and Agriculture Organization, stated publicly that the Iron Curtain and the Bamboo Curtain would be less dangerous if the various sides engaged in trade with each other.

For their part, Chinese business and trade leaders, led by Zhou Enlai, were seeking better trade relations with the West. It was Zhou who coined the phrase “Equality and mutual benefit” as part of the Five Principles of cooperation with the outside world while on a diplomatic tour of India and Burma (Myanmar). The phrase would eventually become the mission statement for the 48 Group. At the time, however, geopolitical discussion was dominated by the Cold War, and top Western and Chinese leaders were withdrawing from each other. Zhou and Lord Boyd-Orr foresaw that such isolation would lead to weaker relations and instability.

The Icebreakers

In 1953 Lord Boyd-Orr formed the British Council for the Promotion of International Trade, and with this group took sixteen representatives of British companies to China to discuss trade. Zhou welcomed the meetings and encouraged more dialogue between representatives of both nations. For their initial efforts both abroad and at home, Zhou, Boyd-Orr, and the business leaders involved, including textiles tycoon Jack Perry, became known as the Icebreakers. The first meeting in 1953 was known as the Icebreaker Mission.

At home the Icebreakers lobbied and pressured the British government to lift trade restrictions with and the embargo on China that had been in place since the beginning of the Cold War. At first the government was unresponsive, but eventually it moved to reclassify certain items that had been categorized as goods of strategic importance, leading to more freedom for trade. These small victories came slowly, but they led to wider support...
among the British business community; in 1954 a delegation of forty-eight companies established a formal trading relationship between the two nations. Members of the delegation, led by Jack Perry, became the first Westerners to do business with the newly minted People’s Republic of China, setting the stage for a relationship based on trade and mutual respect.

**Bilateral Connections**

Throughout the 1960s the group facilitated meetings between single-industry representatives—such as mining equipment producers, construction companies, and port installers—and officials from the Chinese government, providing the group with unprecedented connections within the Communist Party politburo. One of the group’s biggest supporters, besides Zhou Enlai, was Bo Yibo, then chairman of China’s Council for the Promotion of International Trade.

When Mao Zedong initiated the Cultural Revolution in 1966, leaders within the party, including the infamous Gang of Four, were leery of foreign involvement in the PRC. But there were deep disagreements within the leadership about trade policies and openness to the West. Despite this turmoil, the 48 Group maintained contact with the Chinese leadership that was sympathetic to normalized relations. Because of this, the 48 Group in 1970 was the first organization to be invited back to China after the chaos of the Cultural Revolution dissipated.

The relationship between China and the West began to thaw following the diplomatic efforts made in the early 1970s, and because of its strategic relationships maintained over the traumatic years, the 48 Group came to the forefront of foreign business relations with China. Without official ties to the British government and with its mission to support British industry, the group was able to keep its agenda relevant and flexible to China’s changing needs. China had a plan to modernize, so it was important for the group to focus on China’s requirements by introducing specific strategies, technologies, and products timely and effectively. The group sponsored bilateral exchanges, forums, and other programs giving British and Chinese companies that attended these gatherings an edge in winning business contracts within the two nations, and ensuring customer satisfaction, trust, and quality. The small number of importers that were part of the group was just as active as the exporters were and gave China a chance to earn hard currency with which to buy further British goods. A virtuous circle was created, and for many years Britain led the trade with China among Western countries. At the twenty-fifth anniversary celebration in 1978, the 48 Group was recognized as the most potent force in bilateral trade and cooperation between China and the United Kingdom.

Due to Deng Xiaoping’s reforms in the late 1970s and into the 1980s, China became more open to foreign investment and influence, resulting in an explosion of interest from the outside world. Once again the 48 Group, despite the new competition and other significant challenges, had a major role in signing agreements with city and provincial governments in China, engaging with business groups, and bolstering cooperation through a variety of other initiatives. In 1985 and 1988 the group established offices in Beijing and Shanghai to maintain a permanent presence in China.

**The Group Becomes a Club**

In the late 1980s, encouraged by the British Department of Trade and Industry, the group began to explore a merger with the Sino-British Trade Council, which had been operating as an area advisory group to the Overseas Trade Board. In 1991 the two organizations merged to form the China-Britain Trade Group, now known as the China-Britain Business Council, which is now the leading U.K. organization dedicated to helping British companies that do business in China.

The 48 Group Club was formed at the merger, taking on the networking and social functions of the 48 Group, just as the new organization took on its trade functions. The club continues its efforts at strengthening Sino-British ties through its network of guanxi (connections) and by using its reputation as a long-standing and highly respected organization dedicated to trade with China. The club continues to grow in size and influence, and the involvement of young business people from both China and the United Kingdom ensures the continuation of the organization.

China’s president Hu Jintao in 2005 renewed the Ice-breaker mission for the twenty-first century, citing the
need to address the cultural differences between China and the rest of the world. He said that China has a massive trade surplus but a vast cultural deficit. The 48 Group Club’s mission is to decrease that deficit.

The Song dynasty scholar Zhu Xi streamlined Confucian education by compiling the Four Books: Mencius, Analects, Great Learning, and Centrality and Commonality. These texts influenced Chinese culture more than any other classics during the last six centuries of the dynastic period.

The great Song dynasty (960–1279) synthesizer of neo-Confucianism, Zhu Xi (1130–1200 CE), standardized educational methods by compiling what came to be known as the “Four Books.” Before Zhu Xi, Confucian education had concentrated on the Five Classics: the books of History, Poetry, Changes, Rites, and the Spring and Autumn Annals, supplemented by the Mencius, Analects, Xunzi, Chunqiu fanlu by Dong Zhongshu (179–104 BCE), and other texts such as the Classic on Filial Piety and Ceremonies and Rites (Yili). Zhu Xi streamlined the educational process with the Four Books: Mencius, Analects, Great Learning (Daxue), and Centrality and Commonality (Zhongyong, often misinterpreted as the Doctrine of the Mean). The latter two were extracted from Rites.

Zhu Xi wrote commentaries on these four books, reinterpreting them in the light of his syncretic approach, and used them as the foundation of his social, moral, and political philosophy. His innovation had a lasting influence on Confucian education and Chinese bureaucracy in that the Four Books were the basis of China’s civil service examinations from 1313 to 1905, when the examinations were abolished. Zhu Xi, by emphasizing the Four Books, removed many Daoist and Buddhist tendencies from neo-Confucianism. It is no exaggeration to state that the Four Books influenced Chinese culture more than any other classics during the last six hundred years of the dynastic period.

The Mencius describes the teachings of the Chinese philosopher Mencius and expands Confucius’s ideas, stressing the inner quality of the virtues and advocating humanitarian rulership. The Analects contains the teachings of Confucius and advocates moral self-cultivation and rulership based on virtue. The Great Learning explains the chain reaction that starts with the “investigation of things,” beginning a process of moral cultivation that regulates the family, brings order to the state, and ultimately creates peace on Earth. Centrality and Commonality is usually mistranslated as the Doctrine of the Mean, which incorrectly implies that the work is similar to the Greek philosopher Aristotle’s Golden Mean or the Buddha’s Middle Way. However, whereas Aristotle sought a balance between extremes, and the Buddha proposed a way to eliminate extremes, the Confucian concept of centrality is defined as the natural condition “before the feelings of pleasure, anger, sorrow, and joy come forth.”

Fubing System

Fűbing 府兵

Fubing 府兵 was the primary military institution that evolved during the Western Wei dynasty (535–556 CE) and developed and declined from the 540s to the 740s. The dismantlement of the fubing system in the 740s effectively decentralized the military and provided opportunities for career militarists to challenge and undermine the authority of the central government.

Until the early eighth century men considered admission to the fubing to be an honor, and wealthy families were given priority in the recruitments that occurred every three years. The fubing system integrated soldiers into the agricultural population and made the military self-supporting and cost-effective. The militia men, twenty to sixty years old, had permanent status as farmer-soldiers. In times of peace they cultivated their land in the growing seasons, and in the winter months they went on rotational tours to the capitals and frontiers. In return for the extra land allocation and exemption from taxes and corvee (unpaid labor due to the state), they were not paid a salary and had to supply their own food, weapons, and horses.

The Tang dynasty had 634 garrison units, each with 800–1,200 farmer-soldiers. Two-thirds of these men had rotational duties in the capitals, Chang’an, Luoyang, and Taiyuan; the remainder had three-year postings at the frontiers. These units could also be turned into expeditionary forces. The fubing system began to decline in the late seventh century when the uneven burden of services and shortage of land for allocation turned away potential recruits. The move toward a professionalized army began in the 670s with ad hoc recruits and more troops placed directly under military governors. In 695 Empress Wu (reigned 690–705 CE) promoted the examination system in search of new blood from prominent families, who then found serving as officers in the fubing system less appealing than before. By 749 the administration of Emperor Xuanzong (reigned 712–756 CE) had completely dismantled the fubing system and replaced it with a professional army of career soldiers and officers. These reforms benefited
frontier military governors such as An Lushan, but they put the Tang government at risk of rebellion. In the 750s Tang China's professionalized army had the same number of soldiers as the fubing system, but the costs soared and burdened the central government, which now paid the salaries, food, and equipment of all the soldiers. The dismantlement of the fubing system effectively decentralized the military and provided opportunities for career militarists to challenge and undermine the authority of the central government, leading to rebellion and crisis.

Fudan University

Fudan Dàxué 复旦大学

Shanghai’s Fudan University (Fudan Daxue), founded in 1905 as the Fudan Public School, is one of China’s most prestigious universities. As of 2007 the university comprised 17 schools with 70 departments and enrolled well over 40,000 fulltime degree candidates at the bachelor’s, master’s, and doctoral levels, with an additional 15,000 students in schools of continuing and online education.

Fudan University (Fudan Daxue), established in Shanghai as Fudan Public School in 1905, is one of China’s most prestigious comprehensive universities. Fudan’s founder, Ma Xiangbo (1840–1939), an educator from a prominent Catholic family, alluded through the institution’s classical name, roughly translated as “constant heavenly light,” to hopes for a school directed by clarity of vision and inexhaustible self-reliance. These hopes are echoed in aims for Fudan’s contemporary development, summarized in the motto, “Rich in knowledge, tenacious in purpose, inquiring with earnestness, reflecting with self-practice.”

In 1917 Fudan Public School established undergraduate programs and was renamed Fudan University. At the onset of the second Sino-Japanese war in 1937, Fudan was offering courses of study in the arts, sciences, law, and business, in addition to precollege education, and was temporarily relocated to the inland city of Chongqing, like many of China’s postsecondary institutions would be during World War II. The university was nationalized by the republican government in 1941 and moved back to Shanghai in 1946.

At the request of Chen Wangdao (1891–1977), Fudan’s first post-1949 president, Chairman Mao Zedong contributed the calligraphic rendering of “Fudan University” that is today featured on official university plaques and stationary. When China’s institutions of higher learning underwent major reorganization in 1952, Fudan lost its applied professional schools of law, business, and agriculture. At the same time, Fudan’s academic reputation was enhanced by the merger into its faculties of arts and sciences a number of departments and distinguished scholars from ten other universities. Following national reforms in 1978, Fudan restored its professional schools, including business and law.

Mirroring a decade of global reforms in higher education, Fudan has sought to strengthen its basic research and teaching capacities, as well as promote innovation in interdisciplinary and international education. Fudan was selected to participate in China’s 211 Project and Project 985, both of which were national initiatives to enhance the quality and international competitiveness of higher education institutions. In 2000 Shanghai Medical University merged with Fudan, adding for the first time a college of medical science to Fudan’s stable of professional schools.

As of 2007 Fudan consists of 17 schools with nearly 70 departments, 226 research centers and institutes, and 30 key laboratories. Fudan’s most prestigious academic specializations include philosophy, theoretical economics, Chinese language and literature, journalism, mathematics, physics, chemistry, biology, electronic science and technology,
basic medicine, and integrated traditional and Western medicine. The university has an enrollment of well over 40,000 fulltime degree candidates at the bachelor’s, master’s, and doctoral levels, and an additional 15,000 students in schools of continuing and online education. Fudan has more than 2,300 fulltime faculty members and researchers, and significant global outreach with alumni from more than a hundred countries and regions. Fudan works collaboratively with a number of leading universities and is a member of Universitas 21, an international network of twenty leading research universities in twelve countries.

Fujian Province
Fújiàn Shěng　福建 省
35.81 million est. 2007 pop. 　120,000 square km

Fujian, a southern coastal province the size of the state of Pennsylvania, has a rich tradition of international trade and a large flow of migration to Southeast Asia. The province has experienced economic ups and downs, but since 1978 the development of light industry and an increase in investments from overseas Chinese has resulted in a period of huge growth.

Like Guangdong Province, Fujian Province in recent years has played a key role in the economic transformation of China. Its geography and location, its long relationships with other countries and territories, and its tradition of commerce have given it an advantage in China’s economic reform and development processes.

Fujian is a southern coastal province that is endowed with a subtropical climate. Its geography is a study in contrasts—a limited coastal area with ports of different sizes and a mountainous and hilly inland area where communication has always been difficult. Fujian’s limited cultivated land and the demographic pressures that this limitation presents have stimulated emigration, especially from its southern region, from where the Minnan and the Hakka people have fled to Taiwan and Southeast Asia. Although the Hakka and the Minnan are the dominant ethnicities and dialects of Fujian, more than ten dialects are currently spoken in the province because of its traditionally weak communications network.

Not unexpectedly, migration also has stimulated trade. As early as the Tang dynasty (618–907 CE), vessels from as far as the Middle East visited Quanzhou, one of Fujian’s port cities, making the province an important center for international trade and hastening its economic development.

The first blow to this development came during the Ming dynasty (1368–1644) with the “closure” of China and the prohibition of international trade. However, “the ban simply reduced to smugglers and pirates all sea-going merchants, of whom there were many” (Faure 1996, 7). The conquest of Taiwan by Koxinga, a Japanese-Chinese Ming loyalist from Fujian, during the mid-seventeenth century also had a negative impact on trade. During the nineteenth century Fujian greatly suffered from war and lost its importance in maritime trade.

The Communist victory in 1949 marginalized Fujian further. Because of its connections with and proximity to Taiwan, Fujian was considered by Beijing to be politically unreliable. The Communist leadership also feared a military attack from Taiwan, a fear justified by the bombing of the Fujian coast during the early years of Communist rule. Consequently, the province was denied major investment opportunities throughout the Maoist era, while it had to support a predatory army. These two factors were damageable to the Fujian economy because it was traditionally based on light industry and trade, while Maoist policies emphasized the development of rice cultivation.
and heavy industry. As a result, by 1978 Fujian had become one of the poorest provinces in China.

The 1978 economic reforms signaled the renewal of prosperity for Fujian. Once more it could capitalize on its connections with the outside world (including, since the end of the 1980s, Taiwan), and it received huge donations and investments from overseas Chinese. Beijing recognized Fujian’s potential to attract foreign direct investment and created the special economic zone of Xiamen, in the south of the province, in 1980.

These policies also gave more emphasis to light industries, which, along with Fujian’s attraction of foreign investment, allowed the province to become a major producer and exporter of sport shoes, garments, and so forth.

Finally, the reforms that occurred in the countryside at the national level also benefited Fujian, which made use of its comparative advantages: Its status as a major producer of tropical fruits and tea—notably oolong tea from Anxi County, which has become world famous—was re-emphasized. Fujian, despite its limited size and population, was China’s sixth-largest exporter and recipient of foreign direct investment in 2006. With a per capita gross domestic product (GDP) of RMB 21,471 (US$2,683.88), Fujian ranked ninth among all provinces.

Since 300 BCE betting on dice and other games of luck or fortune have been part of China’s historical record. Gambling is now illegal in on the mainland but permitted in Macao, where Chinese casino visitors drive the region’s economy.

In 2001 the Macao Special Administrative Region (SAR) liberalized the Macao casino industry, issuing three gaming concessions to local and international operators and ending the forty-year-old casino monopoly by the Sociedade de Turismo e Diversoes de Macao (STDM). Under the monopoly market, STDM generated $2.32 billion gross revenue from eleven casinos in 2001, which accounted for approximately 60 percent of Macao’s gross domestic product. Since the liberalization, several new casinos have opened, including Venetian Macao, MGM Grand Macao, and Wynn Macao, all run by U.S. companies. STDM has also opened and renovated several casinos. Several other casino hotels and resorts are due to open in the near future.

Individual Visit Scheme

In the summer of 2003, China introduced the Individual Visit Scheme (IVS) to encourage individual mainland Chinese citizens in designated cities to visit Hong Kong and Macao. (Prior to the IVS, people who wanted to travel to these destinations had to be part of a tour group.) As of 2008, 270 million mainland Chinese in forty-nine cities were qualified to travel to Macao as individual visitors. In 2007 Macao, which has a local population of just 500,000 residents, welcomed a record number of 14.9 million mainland Chinese visitors. According to observers, approximately 70 percent to 80 percent of Macao’s casino visitors come from mainland China although they account for about 55 percent of the total tourist arrivals.

Macao’s casino gaming revenue increased from $3.8 billion in 2003 to $10.5 billion in 2007. Although Macao is only one-fifth the size of Las Vegas in land area, it has about five times the number of gaming tables but only about 9 percent of the number of slot machines of the Las Vegas Strip. By 2006 Macao had surpassed the Las Vegas Strip as the top gaming revenue producer in the world, with $7.2 billion in gaming revenue. Analysts have predicted that Macao’s gaming revenue will reach $16 billion by 2012. Gaming taxes have contributed to more than 70 percent of the SAR government’s revenue.

The Chinese and Gambling

Chinese historical records on betting with dice and on Chinese chess matches date back to around 300 BCE. The demand for casino games is embedded in the Chinese culture, which has deep-rooted beliefs in luck and the pursuit of good luck. As one casino industry practitioner in Macao put it, “Basically, all Chinese have the gambling gene.”

These days baccarat is the most popular game. In some VIP rooms in Macao’s casinos, baccarat tables allow a bet of $250,000 per hand, whereas in Las Vegas a $150,000
maximum bet is considered extraordinary. In the United States and many other jurisdictions, the denominations of the chips are differentiated by color, but in Macao the higher the denomination, the larger the chips in physical size, which makes it possible for the mostly Chinese patrons to show off their wealth and ability to play.

Popular as casino gaming is among the Chinese, it is illegal in mainland China partly because of the conflict between the very nature of gambling and the ideology of communism, which encourages the sharing of resources and engagement in productive activities. Given the opportunity, however, the Chinese will gamble. Researchers have estimated that Chinese visitors spent $72 billion in foreign casinos in 2004.

Macao's Hotel Industry

Macao’s hotels have benefited less from the newly mobile and better-off mainland Chinese visitor than its casinos have. The annual average occupancy rate for 2007 was 77 percent (as compared with the more than 90 percent occupancy rate that hotels in Las Vegas enjoy), with an average daily rate of less than $90. The occupancy rate for five-star hotels, however, increased from 68 percent in 2006 to 75 percent in 2007 in spite of the opening of three large new hotels. Occupancy was highest at four-star hotels, at 84 percent. Given that the average length of stay among all visitors was only 1.1 days and that 52 percent of Macao's visitors are classified as same-day visitors, the occupancy rate is not surprising. Mainland Chinese visitors have a slightly longer length of stay (1.3 days), but they tend to stay in three- or four-star hotels and use at the gaming tables what they save on accommodations.

Macao’s gaming industry boom has also benefited Zhuhai, which is just across the border from Macao. Many of the 50 percent of mainland visitors to Macao who do not spend the night there choose to stay in Zhuhai, where accommodations are cheaper. Macao’s residents now earning higher income due to casino and related industry development are more likely to visit Zhuhai for shopping, dining, and entertainment.

Looking Ahead

Mainland Chinese visitors will continue to be important for Macao’s casinos and other tourism businesses, and gaming and tourism will continue to drive Macao’s overall economic development. But the Chinese central government’s policy toward Macao (e.g., expansion or contraction of the IVS) will determine the pace of its gaming and tourism development. Putting policy aside, proper tourism planning, infrastructure development, and human resources preparation will be of tremendous importance to Macao’s economic sustainability moving forward.

The Gang of Four (siren bang 四人帮) is the name given to the four most influential supporters of the Chinese Cultural Revolution (1966–1976), namely Zhang Chunqiao, Yao Wenyuan, Wang Hongwen, and Jiang Qing. Their arrest in 1976 represented the end of the Cultural Revolution, according to the Chinese Communist Party’s version of history.

The Gang of Four (siren bang 四人帮), the epithet given to the four most influential, and notorious, supporters of the Chinese Cultural Revolution (1966–1976), included three men, Zhang Chunqiao, Yao Wenyuan, and Wang Hongwen, and one woman, Jiang Qing. According to the official Chinese Communist Party (CCP) version of history since the early 1980s, the arrest and overthrow of the Gang of Four on 6 October 1976 signaled the end of the Cultural Revolution.

The Gang

Zhang Chunqiao (1917–2005) was a noted radical ideologue. He was born in Shandong province in northeastern China. Zhang joined the CCP in 1940 and fought against the Japanese in 1942 and 1943. After the establishment of the People’s Republic in 1949, he moved to Shanghai and became a radical writer and party propagandist. In January 1967—with the help of the other members of the Gang of Four—he seized control of the local party organization and established the Shanghai People’s Commune, which was modeled on the 1871 Paris Commune. Although the commune was short-lived, Zhang’s actions helped fan the flames of the Cultural Revolution.

In 1969 Zhang was elected to the CPC Politburo. In January 1971 he was appointed Shanghai party leader. And in 1975 he became vice premier and chief political commissar of the People’s Liberation Army. With his new position and power, he began to organize people’s militias, planning eventually to seize power on Mao’s death and to install himself as premier and Jiang Qing as party chairman.

Yao Wenyuan (1931–2005) was born near Shanghai. He became a radical journalist and a dedicated ultra-leftist who believed in Mao’s theory of perpetual revolution. Yao rapidly rose to prominence. In November 1965, he wrote an article that attacked the play The Dismissal of Hai Rui (Hai Rui baguan) as hostile to the Chinese Communist Party and to Mao. At the time Yao’s article was credited with launching the earliest stage of the Cultural Revolution. (The play was written Wu Han, a noted historian and then deputy mayor of Beijing and first published in January 1961. The play tells the story of the good and honest Hai Rui, a Ming official who was vilified for criticizing the emperor’s poor treatment of the people. Wu Han died in prison in 1969.)

Wang Hongwen (1935–1992) was born in Changchun, Liaoning Province, in northeastern China. He joined the CCP and the Chinese People’s Volunteers around 1950 and fought in the Korean War. In 1956 he moved to Shanghai and worked in a textile mill. He also became politically active in the left wing of the local CCP organization and
formed alliances with the future members of the gang. In 1967 Wang served as vice chair of the Revolutionary Committee of the Shanghai People’s Commune. In 1969 he was appointed to the CCP national Central Committee. In 1971 he became Shanghai municipality party leader. And in 1973 he was inducted into the CCP Politburo’s Standing Committee, and Mao made him vice chair of the CCP.

Jiang Qing (1914-1991) was the leader of the Gang of Four and its best-known member. She was born Li Shumeng in Zhucheng, Shandong Province. In the early 1930s she launched a career in acting and appeared in numerous plays and Chinese films. She took the stage name Lan Ping (Blue Apple). Also about that time she joined the CCP. She belonged to several groups that adapted the revolutionary Soviet model of art and literature. Her radical political activities often got her into trouble, and she was jailed several times in the 1930s. (Many of the facts of her life at this time have been expunged from official records.) In 1939 she married Mao, her fourth husband. From then until 1966, she remained in the background of Chinese political affairs.

Even before the Cultural Revolution started she had begun replacing traditional Chinese art with revolutionary art and reforming the Chinese theater, supervising the creation of the “revolutionary model dramas.” Mao appointed her deputy director of the Cultural Revolution in 1966. She used her influence to incite the Red Guards against government officials, senior party members, and old-school intellectuals. From 1969 to 1976, she also served as one of the most powerful members of the CCP Politburo.

The Plot

Sometime in 1975 or 1976, the Gang of Four launched a plot to seize control of China and the Communist Party...
following Mao’s death, with Jiang succeeding Mao as party leader. There was much unrest and plotting within the government at that time, and the term *gang of four* came to be associated with small cliques that isolated themselves from the government. It is said that Mao himself coined the term. It was first used publicly in a speech by Beijing CCP first secretary Wu De (1910–1995) on 24 October 1976 to an enormous crowd in Tiananmen Square. After Wu’s speech, the term was widely used in China.

Following the death of Mao in 1976, the Gang of Four staged its coup. It failed, and all four members were arrested. The CCP Central Committee dismissed all four from their posts, accusing them of being “bourgeois careerists, conspirators, and counterrevolutionary double-dealers.” A power struggle between radical and conservative factions within the party followed. Deng Xiaoping eventually came to power. The four were accused of treason and blamed for virtually all the excesses of the Cultural Revolution.

### The Trial

The members of the Gang of Four were tried by a special court toward the end of 1980. They were accused of a range of crimes, especially of persecuting large numbers of people, including CCP and state leaders. Jiang Qing was most vocal in her own defense, arguing that she was simply carrying out Mao’s wishes. Despite this, all four were convicted. Actually, she was right in the sense that none of the four could have done what they did without Mao’s support, and it was he, not they, who led the Cultural Revolution. But the Chinese government went to considerable lengths to clear Mao of any criminal motivation or action, instead laying blame on the gang.

### The Outcome

Gansu Province

Gānsù Shěnɡ 甘肃省

26.17 million est. 2007 pop. 454,000 square km

Gansu is a northern province about the size of the state of California; it was an important stage on the Silk Roads. Agricultural products include tobacco, millet, wheat, and fruit; manufactured products include heavy machinery, petrochemicals, and nonferrous metals. The western end of the Great Wall is in Gansu.

Gansu (Kansu) Province is located in northern China at the upper reaches of the Huang (Yellow) River. On the west the province borders on Qinghai and Xinjiang provinces, on the north on Mongolia, on the east on Ningxia and Shaanxi provinces, and on the south on Sichuan Province. Gansu covers an area of 454,000 square kilometers and is divided into three topographical regions.

The western region composes part of the Gobi Desert and the so-called Gansu corridor, a passage more than 1,000 kilometers long but only 50 to 70 kilometers wide east to west between the Tibetan Plateau in the south and the Gobi Desert in the north. The Gansu corridor was an important part of the ancient Silk Roads, and agriculture in the oases there depend on the glacial streams from the Tibetan Plateau. The main crops are wheat, sugar beets,
and cotton. The central region, with its extremely eroded terrain, is part of the great Loess Plateau (an area of unstratified loamy deposit believed to be chiefly deposited by the wind) of northern China, parts of which are the poorest districts in China. The southern region is a mountainous earthquake zone rising between 2,000 and 4,000 meters above sea level.

About 90 percent of Gansu’s population are Han Chinese. The remaining 10 percent are distributed among a number of minority nationalities who are either Muslims or who belong to Tibetan religions. The capital of the province, Lanzhou (2007 population 3.29 million), is situated in the rich agricultural area of the Huang River valley in the central region.

Gansu has been under Chinese control and influence on and off since the third century BCE and always has played an important role in trade between central Asia and China. When China was strong, Gansu constituted
the western frontier of China, and the Great Wall ends there. During the Yuan dynasty (1279–1368) Gansu became part of the empire along with Xinjiang and Qinghai provinces. The suppression of a Muslim rebellion in 1862–1878 almost devastated the area, and in 1928 Xinjiang and Qinghai became independent provinces. The borders of Gansu changed several times during the twentieth century, and in 1958 a large part was cut out to become Ningxia Hui Autonomous Region.

In the fertile river valley of the central region agricultural products such as tobacco, melons, millet, wheat, and fruit dominate. Gansu’s highly polluted industrial center, which is concentrated in and around Lanzhou, manufactures heavy machinery, petrochemical products, and nonferrous metals.

Gardens

Yuánlín 园林

The Chinese garden is an expression of nature in a prescribed framework. Gardens are considered venues for spiritual and artistic endeavors, sites for celebrations, and works of art. The history of Chinese gardens is complex and divergent, and it is important to understand not only the design principles but also the spiritual basis of their construction.

Two main garden traditions in China have evolved over time: the vast imperial gardens, symbolic of the power and wealth of the empire, and the scholar, or literati, gardens, built as retreats from the stuffy world of officialdom. The earliest references to gardens in China are found in Zhou dynasty (1045–256 BCE) records describing vast tracts of land reserved for hunting parks for kings and princes. Success in the hunt was a metaphor for a successful reign. Later, in the Chu ci (Songs of Chu), a fourth-century BCE text, a shaman singer attempts to entice the soul of a dying king back to life with a description of the beauties of a garden with winding streams, lotus lakes, and distant views of the mountains. In the Shanglin park of China’s first emperor Zheng (Shi Huang Di, 259–210 BCE), were countless animals, birds, and exotic plants gathered as tribute from vassal states, thus creating a living replica of his entire domain. Poets such as the famed Tao Yuanming (365–427) recorded in verse the pleasures of strolling through one’s garden. Both the Sui (581–618 CE) and Tang (618–907 CE) dynasties saw the further development of imperial and individual gardens. Wang Wei (699–759 CE) created his Wangchuan villa in Lantian County, Shaanxi, a rustic retreat immortalized in poetry and paintings for centuries as the epitome of the scholar’s retreat.

The Song dynasty (960–1279) gave rise to the proliferation of urban literati gardens. At Kaifeng, Song Huizong (1082–1135) erected the Gen Yue mountain, an artificial construct approximately 77 meters tall that contained many famous garden rocks. Khubilai Khan (1214–1294) of the Yuan dynasty (1279–1368) built at Beijing an extravagant city complete with lakes and hunting parks. The subsequent Ming dynasty (1368–1644) revised and embellished the Forbidden City with many courtyards and gardens and developed the Park of the Sea Palaces, a vast complex of gardens and retreats for the imperial family. The most famous of the gardens of the Qing dynasty (1644–1912) was the imperial Yuan Ming Yuan, commissioned by the Qianlong emperor (1711–1799), within which precincts were countless watercourses, pavilions, libraries, farms, training fields for his soldiers, and European-style fountains and buildings.

Cosmology of the Chinese Garden

The unique character of the Chinese garden has its roots in Chinese philosophy, most notably in Daoism. A garden was seen as a mirror of the natural world. Everything in the universe was created from and a conduit for qi, vital energy, or life force. The universe was understood to be a combination of yin (female) and yang (male) elements in...
a state of constant fluidity. A balance of opposites in the construction of buildings, natural features, and plantings was a goal of the garden designer. Re-creating the natural world in a garden was thought to replicate the benefits of immersing oneself in nature, a similar belief to that of the benefits of landscape painting. Scholars whose official duties prevented them from visiting the mountains could enjoy the benefits of nature in their own gardens. The ancient practice of feng shui (literally, wind and water, often translated as geomancy) consisted of properly situating homes, buildings, graves, and gardens in a landscape to promote health, happiness, and prosperity.

Elements of the Chinese Garden

The two main elements of a Chinese garden are rocks and water, symbolizing the yang and yin. Traditional Chinese gardens are constructed in a series of walled outdoor courtyards joined by walkways or doorways. Use of garden rocks (yang) at strategic locations within a garden brings to mind the mountain ranges and peaks of nature. Incorporation of a watercourse, pool, lake, or cascade adds the water (yin) and all its changeable forms. Plants are included for literary and cultural references, for seasonal suitability, and for aesthetic reasons, such as the beauty of their shadows against the light garden walls, or the harmony of the sound of wind and rain in their foliage. Structures such as ting (pavilions with open sides), xie (gazebos), tang (formal halls), and covered walkways make accessible the featured sites in the gardens and the effects of the changing hours of the days and seasons.

Garden structures are named with references to classical literature, and the addition of calligraphy adds another layer of appreciation to the garden. Potted plants are often placed in courtyards at the peak of their blooming seasons, and pools and lakes house water lilies, lotus, and fish. Gardens also include rockeries constructed of aggregates of bizarrely shaped rocks made into miniature mountains or roofs for artificial caves, both symbolic of the entrance to the realms of immortals and useful as an escape from the heat of summer.

Yuan Ye (The Craft of Gardens, datable to 1631–1634), written during the late Ming dynasty by Ji Cheng (late sixteenth-early seventeenth century) is considered the classic text on garden design. Encompassing both practical and aesthetic advice, the manual advises the garden designer to be sensitive to the proper use of contrasts and juxtapositions of elements and to seek the essence lying behind the forms. Details concerning window lattice patterns, doors, wall openings, brickwork for paths, and suitable alignment of the garden with existing landscape features are included.

Chinese Gardens Today

Beihai Park in Beijing in the Forbidden City, which was first built in the tenth century as a hunting lodge, currently encompasses approximately 67 hectares (about 165 acres) of lakes and artificial islands. There an example of a prerevolutionary walled garden, Jing Qing Zhou (Limpid Mirror Studio), once housed the Qing dynasty princes. The West Lake in Yangzhou had its origins in the Sui and

© 2009 by Berkshire Publishing Group LLC
Tang dynasties. Suzhou’s gardens include the Shizi Lin (Stone Lion Grove), built around 1336 for the Buddhist monk Tian Ru, and the Wang Shi Yuan (Garden of the Master of the Fishing Nets), first constructed in 1440.

Suzhou also contains the Zhouzheng Yuan (Garden of the Unsuccessful Politician). The Zhouzheng Yuan dates to the Tang dynasty. It has been variously a Confucian scholar’s home, a garden, a Buddhist monastery, and a warlord’s headquarters. It has changed hands many times and once was sold to pay gambling debts. It is most renowned for its association with the Ming artist Wen Zhengming (1470–1559), who lived there for a time and recorded it in paintings. Wen Zhengming, a Wu School artist and one of the so-called four masters of the Ming, was an unsuccessful politician who, after many failed attempts at success in the imperial examination system, finally secured a minor post but quickly relinquished it to devote himself to artistic pursuits and teaching.

Chinese garden design has spread around the world. Many new Chinese gardens have been built in recent years in America, notably the Astor Garden Court at the Metropolitan Museum of Art in New York City and the Chinese scholar’s garden at the Staten Island New York Botanical Garden.

As one of the world’s longest and oldest civilizations—and the world’s most populous nation, for now—China contributed to the developing study of geography as early as the fifth century BCE. With varied terrains and climates, mighty rivers, rich natural resources, and diverse ethnic and religious groups, China continues to be a land worthy of geographical scrutiny.

China, one of the oldest continuous civilizations on Earth, consists of states and cultures dating back more than six millennia. The term China, which can be translated literally into English as “Middle Kingdom,” referred in ancient times to the Huang (Yellow) River valley. Ancient China introduced the world to a written language system that is still in use and as well to the “Four Great Inventions”: paper, printing, gunpowder, and the compass. As early as the fifth century BCE, the classic Yugong, Tribute of Yu, subdivided Chinese territory into regions, with a summary of mountains, rivers, lakes, swamps, and soils as well as major agricultural products and economic features for each region, and thus geography became one of the oldest traditional studies in China. Gradually the name China evolved to encompass the lands under the direct imperial rule of its dynasties.

As the result of the last Chinese Civil War (1945–1949), two political states now use the name China: the People’s Republic of China (PRC), commonly known as “mainland China” (the focus of this study), and the Republic of China (ROC), which comprises the island of Taiwan and its surrounding islands.

Physical Geography

China (PRC) is the world’s most populous country with more than 1.33 billion people—20.8 percent of the Earth’s population. Occupying most of East Asia, it is the world’s fourth-largest country (after Russia, Canada, and the United States) with an area of about 9,600,000 square kilometers (or 3,705,405 square miles). According to official data posted on the PRC Ministry of Foreign Affairs website, the Chinese territory measures some 5,500 kilometers from north to south, stretching from the center of the Heilongjiang River north of the town of Mohe (latitude 53°30′ N) to the Zengmu Reef at the southernmost tip of the Nansha Islands (latitude 4° N). From west to east, the nation extends about 5,200 km from the Pamirs (longitude 73°40′ E) to the confluence of Heilongjiang and Wusuli rivers (longitude 135°05′ E), with a time difference of over four hours. However, China has only one official time zone—Beijing time.

China’s land boundaries total 22,143 kilometers divided as such among the following countries: Afghanistan, 76; Bhutan, 470; Myanmar (Burma), 2,185; India, 3,380; Kazakhstan, 1,533; North Korea, 1,416; Kyrgyzstan, 858; Laos, 423; Mongolia, 4,673; Nepal, 1,236; Pakistan, 523; Russia (northeast), 3,605; Russia (northwest), 40; Tajikistan, 414; Vietnam, 1,281—and its two Special Regional Administrations (SARS) Hong Kong, 30; and Macao, 0.34.
Cultivation and Mineral Resources

Even though China is one of the largest lands in the world, it has only about 94.97 million ha of cultivated land, mainly in the Northeast Plain, the North China Plain, the Middle-Lower Yangzi Plain, the Pearl River Delta Plain, and the Sichuan Basin. Because China has a large population, the area of cultivated land per capita is small, less than 0.08 ha per capita, or only one third of the world’s average.

But mineral resources abound in China; the nation ranks third in the world in total reserves. As of 2000, about 153 different minerals had been confirmed in the Chinese reserves, including energy sources of coal, petroleum, natural gas, and oil shale. China’s coal reserves total 1,007.1 billion tons, mainly distributed in north China, Shanxi, and the Inner Mongolia Autonomous Region.

Varied Terrain

The territory of the PRC contains a large variety of landscapes. In the east, along the shores of the Yellow Sea and the East China Sea, lie extensive and densely populated alluvial plains, while grasslands occupy the edges of the Inner Mongolian plateau in the north. To the west, major mountain ranges (the Himalayas), and high plateaus stand out from the more arid landscapes of the Taklamakan and the Gobi Desert. In the South, the land is dominated by hill country and low mountain ranges. The Chinese coastline is about 14,500 kilometers along the East China Sea, Korea Bay, Yellow Sea, and South China Sea. China has more than 1,500 rivers, each draining 1,000 square kilometers or larger areas. More than 2,700 billion cubic meters of water flow along these rivers, 5.8 percent of the world’s total. Principle rivers from west to east include the Yangzi (Chang, central), the Huang (Yellow) River,
north-central), the Amur River (northeast), and Pearl River, Mekong River, and Brahmaputra River (south), with most Chinese rivers emptying into the Pacific Ocean. The largest Chinese river, the 6,300-kilometer Yangzi, is the third-longest river in the world, next only to the Nile in northeast Africa and the Amazon in South America, and has a catchment area of 1.809 million square kilometers. The Huang River is 5,464 kilometers with a catchment area of 752,000 square kilometers. But due to economic development for three decades, the Huang no longer flows to the ocean.

China’s geography is highly diverse, with hills, plains, and river deltas in the east, and deserts, high plateaus, and mountains in the west. With a broad area, China’s topography is very complex. Mountains and hilly land take up 65 percent of the total area. There are four main mountain ranges (Himalaya mountain range, Kunlun mountain range, Tanggula mountain range, and Qinling mountain range) that are more than 2,000 meters, and eight mountain peaks (Chomolungma, Godwin Austen, Lhotse, Makalu, Cho Oyu, Gasherbrum, Broad Peak, and Shishapangma) are higher than 8,000 meters above sea level.

China’s terrain descends in four steps from west to east: (1) The top of the four-step “staircase,” often called the “roof of the world,” is the Qinghai-Tibet Plateau, with a height averaging more than 4,000 meters above sea level. (2) The second step, with an average elevation of between 1,000 and 2,000 meters, includes the Inner Mongolia, Loess, and Yunnan-Guizhou plateaus, and the Tarim, Junggar, and Sichuan basins. (3) The third step begins at the perimeters of the Greater Hinggan, Taihang, Wushan, and Xuefen mountain ranges and extends eastward to the coast, with an elevation of about 500 to 1,000 meters. (4) The fourth step of the staircase comprises the lands extending to the east and out into the ocean, in a continental shelf. The water here is less than 200 meters deep. The Bohai Sea, East China Sea, Yellow Sea, and South China Sea embrace the east and southeast coast.

Climate

China’s climate is equally varied, ranging from tropical in the south (Hainan) to subarctic in the northeast (Manchuria). China lies mainly in the northern temperate zone under the influence of monsoons from September and October to March and April. The monsoons blow from Siberia and the Mongolia Plateau into China and decrease in force as they move southward, causing dry and cold winters in parts of the country and a temperature difference of 40° C between the north and south. In the winter, the temperature in China is 5 to 18° C lower than that in other countries on the same latitude. In summer, monsoon winds blow into China from the ocean, bringing with them warm and wet currents and rains.

Great differences in climate are found from region to region owing to China’s extensive territory and complex topography. While the northern part of Heilongjiang Province in northeast China has no summer, Hainan Island has a long summer but not winter. The Huaihe River valley features four distinct seasons, and Yuan-Guizhou Plateau is spring-like all the year. Annual precipitation

© 2009 by Berkshire Publishing Group LLC
also varies greatly from region to region; it is as high as 1,500 millimeters along the southeastern coast and as low as 50 millimeters along the northwest, particularly the Tarim basin.

### Human Geography

Archaeological evidence suggests that the earliest humans in China date to about 2.24 million to 25,000 years ago. In Yunnan Province, "Yuanmou," lived in Yuanmou, Yunnan approximately 1.7 million years ago. "Peking Man," who lived in Zhoukoudian to the southwest of modern Beijing, has fossils dating from 300,000 to 550,000 years ago. Peking Man walked upright, made and used simple tools, and knew how to make fire. Humans in China passed from primitive society to slave society in the twentieth century BCE, with the founding of China’s first dynasty. The Xia Dynasty (2100–1766 BCE) and subsequent dynasties, the Shang (1766–1045 BCE) and Western Zhou (1045–771 BCE), saw further development of slave society. This age was followed by the Spring and Autumn (770–446 BCE) and Warring States (475–221 BCE) periods, marking the transition from the slave society to feudal society. China was one of the first countries to develop economic activity. As early as 5,000 to 6,000 years ago, people in the Huang River valley had already started farming and raising livestock. During the Shang dynasty, people learned how to smelt bronze and use iron tools. White pottery and glazed pottery were produced. Silk production was well developed, and the world’s first figured inlaid silk-weaving technique was being used.

### Geography Develops as a Study

During the Spring and Autumn and Warring States times, philosophy and other branches of scholarship were thriving, with the representatives of various schools vying with
each other in writing books to discuss politics and analyze society. Famous philosophers in this era included Laozi, Confucius, Mencius, and Sun Zi.

In the sixth century BCE the prominent Chinese philosopher Laozi (580–500 BCE) addressed the relationship between humans and nature, asserting that nature is non-human and therefore lacks a sense of will and can be treated objectively. He advised that man’s duty is merely to recognize and utilize nature with his famous saying, “use nature well and no contest.” This idea also represented the thinking of other ancient scholars, such as Mencius.

Most Chinese dynasties were based in the historical heartlands of China, known as China proper; the developing study of geography largely depended on their interest in preserving imperial history. Many dynasties also expanded into peripheral territories like Inner Mongolia, Manchuria, Xinjiang, and Tibet. (China was united by the Qin Dynasty in 221 BCE, possibly accounting for the root of the word China.)

In traditional China, Confucian scholars developed a systematically arranged geographical order that bolstered the imperial ideology—the concept of geography in Chinese history, or Yudi-zhixue, and chronological geography, or Yange Dili—which reached its zenith during the Qing dynasty. Yange Dili, reconstructed historical treatises sponsored by past dynasties, paying special attention to chronological descriptions of changing administrative systems, road networks, and water systems, and to the verification of the locations of key historical events and settlements. Because Yange Dili is based on the history of each Chinese dynasty, some scholars call Yange Dili the last stage of traditional Chinese historical geography.

Modern or scientific geography was not introduced in China from the West until the first two decades of the twentieth century, and it boomed in the 1930s. Scientific geography gave explanations of geographical phenomena rather than bare and tedious descriptions of facts. Among the chief founders of modern geography in China were Chang Xiang-wen (1869–1933), Zhu Kezhen (1890–1974), Ding Wenjiang (1887–1936), Weng Wenhai (1889–1971), Chang G-yun (1901–1985), and Hu Huanyong (1901–1998).

**Ethnicities**

Hundreds of ethnic groups have existed in China throughout its history. The largest ethnic group in China by far is the Han. The Han people make up 91.02 percent of the total population, leaving 8.98 percent for the other ethnicities. Over the last three millennia, many previously distinct ethnic groups in China were assimilated into a Han identity, which over time dramatically expanded the size of the Han population. However, these assimilations were usually incomplete and vestiges of indigenous language and culture often are still retained in different regions of China. According to an official report listed on Ministry of Foreign Affairs of the PRC website, fifty-five minority ethnic groups still exist in China. They are (from large to small in terms of population): Zhuang, Manchu, Hui, Miao, Uygur, Yi, Tujia, Mongol, Tibetan, Bouyei, Dong, Yao, Korean, Bai, Hani, Li, Kazak, Dai, She, Lisu, Gelao, Lahu, Dongxiang, Va, Shui, Naxi, Qiang, Tu, Xibe, Mulam, Kirgiz, Daur, Jingpo, Salar, Blang, Maonan, Tajik, Pumi, Achang, Nu, Ewenki, Jing, Deang, Ozbek, Russian, Yugur, Bonan, Moinba, Oroqen, Drung, Tatar, Hezhen, Lhoba, Jino, and Gaoshan.

In traditional China, classical Chinese was the written standard used for thousands of years before the twentieth century and allowed for written communication between speakers of various languages and dialects in China. Vernacular Chinese, or baihua, is the written standard based on the Mandarin dialect first popularized in Ming Dynasty novels and was adopted with significant modifications during the Republic era of the twentieth century as the national vernacular. Today, most languages in China belong to the Sino-Tibetan language family, spoken by twenty-nine ethnicities. The most spoken dialects are Mandarin by over 70 percent of the population. The other major dialects are Wu (Shanghainese), Yue (Cantonese), Min, Xiang, Gan, and Hakka. Non-Sinitic languages spoken widely by ethnic minorities include Zhuang (Thai), Mongolian, Tibetan, Uighur (Turkic), Hmong, and Korean.

**Religion**

China is a multireligious country, its people practicing Buddhism, Taoism, Islam, Catholicism, and Protestantism. Various religions exert different influences on different ethnic groups. For instance, Islam is followed by the Hui, Uygur, Kazak, Kirgiz, Tatar, Dongxiang, Salar, and Bonan nationalities, and Buddhism and Lamaism are followed by the Tibetan, Mongolian, Dai, and Yugur nationalities. Christianity is followed by the Miao, Yao, and Yi nationalities.
Modern Administrative Geography

Top-level political divisions of China have altered as administrations changed, beginning with the founding of Republican China in 1911 and throughout the People's Republic of China (1949–present). In 2008, PRC administrative geography embraces twenty-three provinces (note: the PRC considers Taiwan the twenty-third province), five autonomous regions, four municipalities, and two special administrative regions, Hong Kong and Macao. Below these top levels are prefectures, subprefectures, departments, commanderies, districts, and counties. Recent divisions also include prefecture-level cities, county-level cities, towns, and townships.

In 2008, China's extensive national land and maritime boundaries are the source of international disputes with their neighbors. Land boundaries include those with India, Tajikistan, North Korea, and Russia (a section). Maritime boundaries are more complex, including Spratly (Nansha) Islands with Malaysia, Philippines, Taiwan, Vietnam, and Brunei; Paracel (Xisha) Islands with Vietnam and Taiwan; and Diaoyu (Senkaku) Islands in the East China Sea with Japan and Taiwan. However, the Chinese government claims a total of 5,400 islands dotting China's vast territorial waters. According to the official website, the largest of these is Taiwan (area 36,000 square kilometers), followed by Hainan (area of 34,000 square kilometer). Diaoyu and Chiwei islands, located to the northeast of Taiwan Island, are China's easternmost islands. The many islands, islets, reefs, and shoals on the South China Sea, known collectively as the South China Sea Islands, are subdivided into the Dongsha, Xisha, Zhongsha, and Nansha island groups.

The Chinese geography is unique—as the vast land with relatively little cultivated land to its feed 1.33 billion people, and as a rich culture with peoples of diverse ethnic backgrounds and religious.

Ginseng (Panax ginseng) is a small woodland plant indigenous to mountain forests in Asia, especially Manchuria, and is now cultivated primarily in Korea. Its root is valued for medicinal purposes, especially for its effects on the nervous system.

Ginseng (Panax ginseng; or renshen in Chinese), was discovered in Manchuria over 5,000 years ago and is indigenous to mountain forests from Nepal to Manchuria. It is a member of the Araliaceae family, and is one of a number of related plants valued primarily for their calming effects on the brain and the rest of the nervous system. Ginseng is said to restore physical

An engraving of the ginseng plant by Joseph-Francois Lafitau (1681–1746).
and mental vitality, defend the body from the effects of physical strain, and stimulate the endocrine glands.

Ginseng is the best-known medicinal product in China, where it is most prized for its perceived benefits to the urogenital system of aging men, whose sexual problems are a major concern in traditional Chinese medicine. After the swollen root of the plant has been carefully cleaned and dried, medicinal extracts can be made, primarily with alcohol, and to satisfy Western tastes for medicinal teas the root can be ground into powder. The suggestively anthropomorphic shape of this small woodland plant’s root has long been for some a powerful symbol of divine harmony on Earth.

The growing range of ginseng is rather limited, and its supply that grew mainly in the lush forests of Manchuria, and commercial cultivation of ginseng began in Korea to replace and expand root sources in areas where wild ginseng has disappeared. Interest in ginseng as a cure-all had also grown in the West by the nineteenth century, and the remotest parts of Manchuria were soon harvested from end to end by ginseng hunters. They advanced far into Siberia as Manchurian resources were depleted. By the late nineteenth century China was even importing wild ginseng from Canada and the United States (Panax quinquefolium), a trade that continues to some extent, although both countries are now net importers of ginseng, mostly from South Korea.

The Golden Lotus is the first lengthy novel by a single author in Chinese literary history, and is noted for its highly sophisticated combination of plot and composition as well as its explicit sexual contents. The plot is set in Northern Song (960–1126) China and tells the story of the rise and fall of the merchant Ximen Qing.

The title of Clement Egerton’s 1953 English translation of the Chinese novel Jin Ping Mei, which was written by an anonymous author towards the end of the sixteenth century and first published in 1617 or 1618. The English title refers to the main female character, Pan Jinlian, whose personal name means Golden Lotus, whereas the Chinese title alludes to the three principal women in the novel; Pan Jinlian, Li Pinger, and Peng Chunmei. Jin ping mei literally means “the golden vase plum twig” — the twig in the vase being an allusion to sexual intercourse — and due to its sexually explicit contents the novel has been banned for long periods of time.

The story line tells how the licentious bourgeois merchant Ximen Qing rises to prominence and wealth and how his self-inflicted decline leads to his death from a lethal dose of aphrodisiac. Ximen’s undisguised partiality for his sixth wife Li Pinger slowly but surely disrupts the household, and his excessive sexual behavior eventually causes the deaths of those dear to him. The plot is set in Northern Song dynasty China (960–1126) in the latter half of Emperor Huizong’s reign (1100–1126) when worsening domestic crises eventually lead to the downfall of the dynasty and the Jurchen occupation of Northern China. The household of Ximen has many obvious parallels to the imperial house and the historical events; for example, the six wives of Ximen are thought to represent the six immoral ministers who were held responsible for the collapse of the Northern Song. It is also a widely held belief that the anonymous author deliberately used the plot as a concealed criticism of his own time, the declining years of the Ming dynasty (1368–1644). The novel is more likely a moral response to the sexual eccentricities it depicts in graphic detail than it is an endorsement of these.

The Jin Ping Mei stands out in Chinese literary history as the first lengthy novel by a single author and for the highly sophisticated combination of plot and composition. The novel consists of one hundred chapters of which chapters 53 and 57 are suspected to have been inserted by other authors. The Jin Ping Mei draws on a wide variety of literary sources and traditions but the author never loses focus on the story and the characters.

The composition of the novel may be broken down in several ways. It may be divided into ten parts of ten chapters each, which share the same repetitive patterns; thus when new elements and surprising developments are introduced into the story, it usually happens in the seventh chapter of each division, and a high point is reached in the ninth chapter. The novel has also been analyzed as being composed of four divisions: A prelude of twenty chapters introducing the cast, a main part in two divisions of thirty chapters each, and coda of thirty chapters.
chapters each describing the rise and fall Ximen Qing, and a postlude detailing the collapse of his household.

A complete translation into English entitled *The Plum in the Golden Vase* is being undertaken by David Tod Roy, with three of five planned volumes published as of 2006. Several movies have been based on the plot.

**From Jin Ping Mei**

_In the following passage taken from David Tod Roy's translation of Jin Ping Mei, an estranged husband and wife reconcile after he observes her lighting incense and praying for him._

“Darling,” he said, “I had absolutely no idea that you’ve really been inspired by concern for me. I’ve been wrong about you all this time. I’ve been giving you the cold shoulder. By now, I’m afraid, it’s rather late to repent.”

“You must have lost your way in the snow,” said Yueh-niang. “I dare say these really aren’t the quarters you’re looking for, anyway. You’re barking up the wrong tree. I’m that ‘undutiful whore,’ remember. Since there’s nothing between us, where do you get that stuff about concern for you? What reason should you have to pay any further attention to me? If we were never to see each other again:

For a thousand years or all eternity, it would be all right with me.

Hsi-men Ch’ing took Yuen-niang by the hand and pulled her into the room where he proceeded to look her over by lamplight. She was wearing her usual attire: a scarlet jacket of Lu-chou silk that opened down the middle, and a skirt of a soft yellow material. On her head she wore a sable toque over her chignon and, in front of her coiffure, a tiara of gold representing “Kuan-yin in her full glory,” setting off to perfection:

Her silver salver face, modeled in plaster carved of jade; The clouds over Ch’u peaks, her cicada chignon and raven tresses, How could Hsi-men Ch’ing have been anything but captivated?

Goldfish, or jinyu 金鱼, are ornamental aquarium and pond fish originally cultured in China that later were spread to East Asia and the world. Due to accidental genetic mutation at first and artificial selection later, goldfish have developed from carp into 500 different types of goldfish today. Goldfish are now a world-wide industry. Activities written in the Han Dynasty (206 BCE–220 CE). Wild red carps, forerunners of goldfish, were first raised in a pond at a temple at the turn of the twelfth century.

A crowd views the goldfish at San Frank Park in Hangzhou. Photo by Joan Lebold Cohen.
Emperor Gaozong of the Southern Song Dynasty (1127–1279) started a fad, which spread first among his followers and then the common people, to raise red carps in their family ponds. Separated from other species and fed with specific food like water fleas, the fish began to mutate genetically. Subconscious selection helped the process. By the mid-sixteenth century, red carps, known as huoyu (fire fish), were bred in gang (bowls or jars) as popular pets. Conscious selection happened two hundred years later, resulting in different colors of their scales and shapes of their body parts. At the start of the twentieth century, there had been more than twenty varieties of goldfish. This number increased to more than seventy in the mid-1930s and to about 160 today.

Goldfish found their way to Japan in the early 1500s, to Portugal in the early 1600s, to England at the end of the 1600s, and to France in the middle of the 1700s. About a century later, they came to the United States and from there spread to the other parts of the American continents.

Having learned the art of breeding goldfish, culturists of other countries, Japan in particular, produced some four hundred varieties in addition to the Chinese varieties.

According to Goldfish Varieties and Genetics: A Handbook for Breeders (Smartt 2001), goldfish are classified into the varieties of Common Goldfish, Comet, Shubunkin, Wakin, Jikin, Fantail, Ryukin, Tosakin, Veiltail, Telescope, Celestial, Bubble-Eye, Pompon, Pearl Scale, Oranda, and the Ranchu-Lionhead Group. Common Goldfish, Comets, and Shubunkins are relatively simple fish that have typical single tail fins. Common Goldfish are known for their colors ranging from white, black to yellow, orange, and red; Shubunks are noted for their nacreous (mother-of-pearl-like) scales; and Comets are distinguished by their long and deeply forked tail fins. Jikins and Wakins have double tails, but with the body shaped like Comets. The others are known as “fancy fish.” Veiltails, as the name suggests, are known for their long flowing tails. Fantails are also recognized by
their medium sized double-split tail fins. Ryukins look like Fantails except for their characteristic hump in the shoulder region. Tosakins’ bodies are shaped like those of Ryukins, but their undivided tail fins are open and spread like the tail of a peacock. The Pearl Scale goldfish are also noted for the pearl-like appearance of their scales. Among the fancy fish type are also Pompons that have soft and fluffy growths above the nose and Telescopes that feature enlarged and bulging eyes. Celestials with their eyes upturned and Bubble-Eyes that have a sack under each eye are cousins of Telescopes. Orandas and goldfish of the Ranchu-Lionhead Group share the trait of a head growth known as hood. Ranchus and Lionheads differ from Orandas in the lack of their dorsal fins.

The Chinese, however, categorize goldfish into four major breeds, a system not commonly adopted in the West. They are 1) Caojin (grass goldfish), a group that includes the Common Goldfish, Comet, Jikin, Shubunkin, and Wakin varieties; 2) Wenjin (colorful goldfish), a type that covers the Fantail, Tosakin, Pearl Scale, Ryukin, and Veiltail breeds; 3) Longjin (dragon-eyed goldfish), comprising the Celestial, Bubble Eye, and Telescope varieties; and 4) Danjin (egg-shaped goldfish), including the Oranda and the Ranchu-Lionhead Group.

Chinese characters have an excessive number of homophones (words that sound alike but have different meanings), and for that reason the Chinese are fond of playing on words and symbols that reflect on the cultural significance of fish. Buddhist believers may see red carp, abnormal forms of the usual greenish-gray carp species, as sacred, and let their captives go as a show of mercifulness, but the average Chinese, taking a more secular approach, associate “fish” with “affluence” because the two words sound alike. Goldfish, pronounced as “jin yu” are homophonic to “gold” and “jade,” which are cultural symbols of girls and boys respectively. So the phrase “jin yu man tang” (a pond full of goldfish) is thus a pun for “a house full of children,” and having more children is the ultimate expectation of a Chinese patriarch. By calling the hood of a Lionhead goldfish shouxingqiu (ball of the god of longevity), the Chinese impart to the fish a good wish for a long, healthy life.

Today goldfish are mass produced in coastal cities of China and sold domestically and abroad. Goldfish hatcheries in Beijing alone occupy a total of 1,000 hectares (about 2471 acres). In 2001, China sold about 400 million goldfish at home, and today exports about $100 million worth of ornamental fish annually, mostly goldfish, to about 100 countries.

Throughout its history, China has been ruled according to one (or a combination) of three different principles of governance. The same basic precepts that have applied for thousands of years are still active today.

The concept of governance includes a wide range of subjects relating to how nations have exercised authority and enforced social and political order. In fact, humans have had governance long before there were nations in the modern sense. For traditional Chinese rulers over the centuries, the principles of the Mandate of Heaven reflected the moral order of the universe and charged authority at all levels with the welfare of subordinates. China has experienced only a limited range of governmental types in its long history, all of them centralized, and each one involving one or more of three main guiding principles of governance: lizhi 礼治 (rites and rituals), fazhi 法治 (laws), and renzhi 人治 (rulers).

**Tianming 天命: The Mandate of Heaven**

Over many centuries, traditional Chinese rulers sought to acquire a source of legitimacy in what was traditionally referred to as the “Mandate of Heaven,” or Tianming. Most probably, the concept first emerged to serve the political needs of Zhou dynasty (1045–256 BCE) rulers who, by military conquest, ended the Shang dynasty in the eleventh century BCE. As usurpers, the Zhou needed a means to legitimize their seizure of power, which would immediately become justified if they could claim that their predecessors had failed to respect the Mandate of Tian 天命. Though Tian is commonly translated as Heaven or the heavens, both of these English words typically carry a misleading evocation of a Western-style Creator-God who resides in heavenly realms; hence the term is not subject to translation here in order to mark the difference. In general, Tian is most appropriately conceived as a name for the higher powers operating within a totality composed of heavens above and earth below.

By the time of Confucius (sixth century BCE), Tianming began to be applied to authorities at all levels, indicating an obligation to see to the welfare of their subordinates. Over time, Tian, though impersonal, came to be seen as potentially concerned for the welfare of human beings. The key test was prosperity, implying that rulers needed to ensure the material welfare of their people. If a ruler ceased to rule justly or wisely in these terms and began to rule only with his own self-interest at heart, then he could be seen as having lost the Mandate of Tian. In that case, an attempt at overthrowing the ruler might be justified. Rebellion was always a tricky proposition, however, because rebels could only justify the legitimacy of their revolt when and if the rebellion ended in their favor.

The Mandate of Tian thus came to represent the moral order of the universe. When the proper order was respected, the physical world ran smoothly and the human world prospered. When that order was not respected, anomalous and/or destructive events, such as earthquakes, floods, eclipses, or even epidemics, took place in the normal order.
of the universe. Solar eclipses were particularly difficult to forecast, but predicting them accurately was a way of assuring the populace that the central authority was indeed in touch with the powers represented by Tian, and thus worthy of their allegiance. Making accurate predictions became so important that emperors sought out the finest astronomers and mathematicians they could find, even if they were not always Chinese. When the Italian Jesuit Matteo Ricci (Li Madou, 利玛窦, 1552–1610) arrived in China late in the Ming dynasty 1368–1644), he was welcomed because he offered calculations that improved on those given by the mathematicians from India who had previously staffed this imperial service.

**Lizhi, Fazhi, and Renzhi**

A basic distinction in Chinese political thinking as to the nature of social-political order and the best means of achieving it is marked by the distinction between li 礼, conventionally translated as rites or rituals, and fa 法, conventionally translated as law or regulations.

Lizhi 礼治, traditionally associated with Confucianists 儒家, refers to political order based on reference to the li (or rites, that is, traditional customs and norms). This form of governance tends to be localized and situation-based.

In contrast, fazhi 法治, traditionally associated with Legalists 法家, refers to order attained primarily through reliance on publicly codified rules backed by the power of the state. In contrast to the Confucianists, who taught that social order would come from knowing one’s proper place in life, the Legalists promoted strong (often ruthless) centralized authority.

The relative merits of these two approaches—lizhi and fazhi—to social and political order have long been debated in the Chinese tradition. Basic differences in these positions still persist in debates about governance today.

First, advocates of lizhi tend to favor less formal means of maintaining order than advocates of fazhi. The former believe that informal methods foster more nuanced and situation-specific justice; the latter believe such methods give excessive discretionary authority to those in power and thus foster corruption and other abuses.

Second, fa (in the sense of laws) refers to formal rules of greater general applicability than li, which constitute the web of informal rules that were traditionally understood as attached to hereditary elites. Fazhi, therefore, is an externally imposed order that requires compliance more than participation, whereas lizhi emphasizes individual commitment and self-discipline as a way of maintaining social order.

Third, advocates of lizhi tend to be more optimistic about human nature and the possibility of achieving a harmonious social order in which each person is able to find a place and play an appropriate role. They tend to see civility, social order, and humanity as attainable goals. In contrast, many advocates of fazhi take a dimmer view of human nature. They see humans as so self-interested that, left to their own devices, the strong will exploit the weak. Impartial rules are necessary to limit the harm that one person can do to another. Thus, according to fazhi, law should serve to ensure minimal protection to all by systematically punishing transgressors.

Overall, there has been no stable dominance in China of either lizhi or fazhi, partly due to what (in modern perspective) can be seen as the inescapable importance of a third element: the attitudes and judgments of the ruler (renzhi 人治). Different supreme authorities exercised a decisive influence on the relative importance given to one or the other value at any particular historical moment.

When modern leaders seek stability above all, they may well evoke both morality (lizhi) and legality (fazhi, in its modern rule-of-law sense). During the 1990s, for example, President Jiang Zemin reiterated from time to time the principle that the People’s Republic of China should be governed with morality (yi de zhi guo 以德治国) in addition to laws (yi fa zhi guo 依法治国). Thus today’s Chinese authorities rely on both lizhi and fazhi depending on circumstances: They encourage good behavior (in relation to implementing current policies) by positive encouragement, but hold in reserve strong threats of punishment for anyone who proves recalcitrant.

While this assertion applies mainly to the strong centralized government, recently there have been moves towards a more popular basis for local government. Thus in many regions, village councils now have members elected by popular vote. Such procedures, however, do not imply a widespread adoption of Western-style principles of democracy. Over much of the last thousand years, while China was ruled by authoritarian emperors, villages chose their own local leaders, often by election. Hence, in China,
such practices have proved to be fully compatible with highly centralized power structures. In addition, locally elected officials typically have less clout than the village Party secretary, who is appointed by the Party, as are the officials of townships and counties, the next higher levels of administration. Since their support is needed for any local complaints to be taken seriously, the practical effects of these elections are tightly circumscribed.

**Chinese Political Thinking**

Chinese political thinking has always been hierarchical and organized around a strong central authority. Chinese leaders are normally seen as being able to determine what is in the best interests of society and its members. Indeed, much of their authority is based on their claim to superior ethical insight and political wisdom, that is, their knowledge of the best way to govern under current conditions.

In accordance with Confucian teaching that the harmonious family is the best metaphor for good governance, the image of the father traditionally dominates political rhetoric in China, though the specifics of the image vary according to the writer’s convictions. The Confucian (lizhi) father-ruler is kind, compassionate, and more a facilitator of order than an imposer of order. The Legalist father-ruler (fazhi) is a tough disciplinarian who well understands that—in Western idiom—“to spare the rod is to spoil the child.” Nevertheless, such a stern father, knowing what is best, takes care of his children.

As part of its holistic worldview, China has long assumed that the interests of the state and the individual can be brought into harmony. If one makes this assumption,
there seems no need to evoke rights to protect the individual against the state. The situation is very different from that in the modern West, where individual human rights are often evoked as the only way to protect individuals from the power of the state.

Given these differences in orientation within China itself, it seems safe to predict that disagreements about governance will continue. China has always had a strong central government, and there is no visible reason to believe that will change. But in the case of how that central government governs—whether by lizhi or fazhi or some combination of both—there is no final word on such debates. No system of governance is perfect because no one has yet achieved the ideal means for realizing and maintaining social order.

Governance System, Dual

Liǎngyuánhuà lǐngdǎo zhìdù
两元化领导制度

The People’s Republic of China, unlike other nations, is governed by a dual system. The government, as the visible face of this system, includes familiar branches called legislative, executive, and judicial. But behind this government the high leadership of the Chinese Communist Party determines policy at all levels, which the government merely implements and disseminates.

The dual governance system of the People’s Republic of China (PRC) has proven to be an effective way to cope with the extraordinary problems of managing a polity on China’s massive scale. Since the end of the Soviet Union in the early 1990s, this system is unusual in the world today, perhaps even unique, because the center of power lies behind the government, not within it. For comparative purposes it is important to clarify how the present order came about and how it functions.

Westerners often assume that the Chinese government operates as the power governing the country. But in the PRC, the government is merely the outward and visible face of the governance system. Behind (and above) the government is the Chinese Communist Party (CCP). The Party determines policy and oversees appointments to all levels of government and to Party supervisory committees, even in corporations and non-governmental organizations. In effect, the CCP comprises a “shadow” government that shares some superficial characteristics with the “shadow cabinet” in the U.K. In England the “shadow” ministers watch over (and criticize) their official counterparts as part of their role as a “loyal opposition.” But in the United Kingdom they have no power as such and can only appeal to the people at large when they have criticisms to make. In the PRC, the “shadow” officials are active at all levels of organization, and they, in fact, are in charge, dominating their government counterparts through the dual system of governance.

Soviet Origins

The Party-State dual governance system originated in Soviet Russia. Vladimir Lenin (1870–1924) put forth the idea that the Communist Party’s task was to provide political leadership, rather than actually to govern. Under Josef Stalin (1879–1953), however, power became intensely centralized, to the point of overriding any possibility of a division of power between Party and government. The Soviet system, then, became a de facto unitary governing system under the Party. The chief mechanism for maintaining central control was that every major government and military office had a duplicate counterpart in the Party structure. The job of the Party representative was to double-check in advance on any action that might be undertaken by any government official. In case of disagreement between the two, the Party view prevailed, on the grounds that overall effectiveness required a coherent source of policy.
History in China

The Nationalist (GMD, Guomindang) Party (as constituted in 1919), led by Sun Yat-sen until his death in 1925, was the first to adopt the dual governing system of the Soviet Union. This represented a significant shift away from the unitary political control system that had been characteristic of Chinese political history for thousands of years. As a Leninist party structure, this one too was designed to protect against possible subversion.

After the establishment of the PRC in 1949, this dual system from the USSR became established national practice. After the third session of the Party’s eleventh congress in 1978, Deng Xiaoping and other leaders decided to reform the dual relationship so that the Party would be more discreet in exercising its control. This evolution was part of the reform process that tended to decentralize the governance system nationally.

Contemporary Party-State Relations

The relationship between the CCP and the State begins with the legislative branch of State power, the NPC (National People’s Congress) and extends through the executive and judicial branches of government. The relationship between the Party and the executive branch is mainly exhibited in the Party’s political, ideological, and organizational leadership, while the Party’s control over the judicial branch is shored up by policies that ensure against undue independence on the part of magistrates and judges.

The Legislative Branch

As the primary legislative branch, the NPC (with its local branches) has been set up under the direct leadership of the CCP. Members are designated for five-year terms and may be reappointed. Legislative proposals, including constitutional amendments and other proposals, either for new legislation or revisions of existing laws and regulations, are presented to the NPC and its committees at various levels by corresponding Party committees. In recent years the NPC has resisted rubberstamping legislation proposed to it, at least when controversial issues are involved. The most visible example involves the role of private property within the socialist State. Starting in 1993, draft laws were long debated in the NPC, leading to significant changes to the legislation that became the 2007 Property Law. Though the effectiveness of this law remains to be tested in practice, it does legitimize the registration of private property rights for the first time since the creation of the PRC in 1949.

Any change in the country’s political orientation, significant economic and social development policy guidelines, highly influential projects, and the like are decided first by the Party, and then sent to the NPC as proposals, which, through its legitimating procedures, become decisions of the State. According to the nominating criteria required in relevant Party regulations and laws, CCP committees recommend appropriate people to fill the important positions in all branches of the government and bring these nominations before the NPC. These nominations, made by the Party for the State, constitute a major organizational safeguard by which the Party exercises its direction of State affairs and maintains its political centrality.

The CCP’s leadership dominates the State’s executive and judicial branches. Party organizations established within the National Congress and its committees at various levels report regularly to Party committees, and maintain oversight over the People’s Congress.

The Executive Branch

The relationship between the CCP and the executive branch (i.e., the State Council and local administrative branches) is one of political, ideological, and organizational leadership. Politically the CCP defines principles, fixing the nation’s course and direction and making all important decisions. In such an arrangement the will of the Party becomes the will of the State by means of legislative procedures.

These political principles find their guiding ideologies within the Party as well. As one Chinese political scientist recently reaffirmed, as translated into English by Qin Chuan: “The Party applies Marxist worldview and methodology in order to guide all administrative staff. The Party’s propaganda organ uses ideological build-up, spiritual-civilization construction and propaganda education to educate cadres in how to oppose corruption and
interference from out-dated thinking patterns, so as to better serve the people” (Lu 2001, 261).

Organizational leadership follows naturally and inherently; it is accomplished by the CCP at all levels through Party organizations established within every department of the State. In practice, that means that a person or a committee responsible to the Party is active at every level of organization. Although these commonly operate out of public view, their influence is great. The CCP and local committees also recommend candidates for administrative leadership positions, who are to be elected by legislative branches. The Organization Department of the Party has particular responsibility for nominations and appointments.

**The Judicial Branch**

The relationship between the CCP and the judicial branch (i.e., The People’s Court and The People’s Procuratorate (Attorney General’s Office) is one of organization, that is, setting up guidelines, and support through community education and coordination with other departments within the State. The way this relationship is designed to work has been described recently by Lu Shigong, a Chinese political scientist, as one in which “the Party supports the judicial endeavor to strengthen Party leadership, educates citizens, protects the judicial from external interference in order to preserve its independence, guarantees this independence by coordinating its relationships with other departments, using Party members within the judicial branch itself” (Lu, 2001, 286–290). If the independence of the judicial body is enhanced by coordinating its activities with other departments of the State, the result may be greater governing coherence but at the price of judicial independence.

**Overview**

Westerners will recognize here the three branches of governance with which they are familiar: the legislative, the executive, and the judicial. That familiarity should not, however, lead to easy assumptions that the Chinese dual system is not so different after all. In all of these domains—and at all levels from the local to the national—the Party is in control, deciding not only broad policies but also who will fill each role within the governing structure. Moreover, each position in the governmental hierarchy will have a shadowing “twin” in the Party structure. The National People’s Congress is the centerpiece of the legislative process, composed entirely of members approved by the Party. The same is true of all members of the government, the courts, the police, provincial and local committees, and so on.

The National People's Congress appears here on the left as the primary organ of the State, due to its role in officializing decisions that originated in the Party structure diagrammed below. The State Council, which serves to
implement decisions, normally takes its direction from the Central Committee, a primary organ of the Party. The Central Committee has about three hundred members, bringing together major figures in the Party, the State, and the military. The Central Committee in its turn is directed by a standing political committee known as the Politburo, currently with twenty-five members. The Politburo normally meets once a month, but its day-to-day business is handled by a standing committee of nine. These nine individuals are responsible above all others for formulating decisions and seeing to their application throughout the administrative system. This is the level of governance where alternative policies can be debated, though always outside of public view. Its decisions are said to be made by consensus rather than a voting process.

The arrows in this diagram point upwards to indicate how decisions generated within the Party apparatus end up as officialized by the National People’s Congress.
Through all these levels, the key factor is control over who will occupy positions in the Party hierarchy as well as in the State. Appointments remain under the control of the Party leadership. There are roughly 70 million members of the Communist Party, not quite 6 percent of the population. This group defines the political class in today’s China and functions as a leadership oligarchy.

The PRC dual system allows the vast governing apparatus to be responsive to an authoritative and centralized source of decision making. If the system sometimes seems unduly repressive to some Western observers, it also permits exceptional attention to long-term needs as opposed to short-term problems.

Zhī xǔ zhōu guān fàng huǒ, bù xǔ bǎi xìng diǎn dēng
Originally built during the Sui dynasty (581–618 CE), the Grand Canal is a major waterway that unified northern and southern China, serving as a connection between major cities and as a vital means of maintaining trade relations within the empire. Today it is still used to transport goods such as bricks, gravel, sand, diesel, and coal.

The Grand Canal is an artificial waterway constructed in China during the Sui dynasty (581–618 CE) and expanded during subsequent dynasties. The Chinese refer to this canal as the yunlianghe or “grain transport river,” or alternately as the jinghang dayunhe or “Beijing Hangzhou Grand Canal.” The canal was and is still used to transport both raw and finished goods between northern and southern China. The Grand Canal was crucial to the maintenance of the Chinese empire, enabling the Chinese to use the rich agricultural lands of southern China to help feed people in the north. It was also crucial to trade relations within the empire and to trade relations between the Chinese and the peoples of the steppes (vast, usually level and treeless tracts in southeastern Europe or Asia). In imperial times the canal was used principally to transport tribute grain (grain paid by other countries in deference to China’s position of power in Asia) to the capital, but it was also used to ship large quantities of tea, cotton, and other supplies.

China is blessed with an abundant river system, which gave China a comparative advantage over trading networks in Europe, central Asia, and Africa, which had to rely on camel caravans and more tempestuous oceanic routes. Over the centuries China also developed a sophisticated knowledge of canal building. As early as the Warring States period (475–221 BCE), states in China were building canals. The state of Wu in present-day Jiangsu Province built a canal to facilitate the transportation of soldiers to fight the state of Qi in Shandong. After the Qin unification in 221 BCE the Qin emperor ordered the building of canals to ease transport of goods and soldiers to the deep southern region of Guangzhou (Canton).

North and South Connected

After the decline and fall of the Han dynasty (206 BCE–220 CE), during a four-hundred-year period of disunity, the northern and southern regions of China separated into a series of competing, overlapping dynasties. When the Chinese empire was reunited under the Sui dynasty the son of the first Sui emperor, Yangdi (reigned 604–618 CE), saw the need to promote national unity by connecting the north and south through the construction of a canal system. During this period canals were constructed to connect the southern city of Hangzhou to the nearby city of Suzhou (once the capital of the state of Wu) and on to the town of Yangzhou on the Yangzi (Chang) River. These cities would continue to prosper for centuries as major nodes in the Grand Canal transport network. From Yangzhou the canal headed northwest to the city of Luoyang in present-day Henan. The Huang (Yellow) River then connected the Grand Canal...
to the ancient capital of Xi’an. From Luoyang the canal was extended northeast all the way to the northern coastal city of Tianjin, where a river leads to Beijing. Thus, for the first time in China’s history the Huang and Yangzi rivers were connected, and a waterway extended from the Huang River valley to China’s northeastern border regions.

During the Tang dynasty (618–907 ce) the Yangzi River valley began to be settled in great numbers by Chinese from the north. This settlement process continued through the Song dynasty (960–1279). This region became the most economically and agriculturally productive in all of China and arguably in the world until the Industrial Revolution. The Grand Canal tapped and stimulated the growth of this region, carrying tribute rice and other goods to the northern capitals of Xi’an and Luoyang and eventually to Beijing. When the Song dynasty began, it chose Kaifeng as its capital, which was the site where the early Grand Canal fed into the Huang River. Advances in agriculture, canal building, and shipping during the Song dynasty greatly stimulated the production of grain in southern China, and the Grand Canal was vital to the rise of the Yangzi River valley as China’s most productive region. In 1127, when the Song dynasty shifted its capital to the south under heavy pressure from the northern Jurchen people, who established their own dynasty, the Jurchen Jin dynasty (1125–1234), the Song dynasty chose Hangzhou, the southern terminus of the Grand Canal, as its new capital.

During the early years of the Yuan dynasty (1279–1368) under Mongol leader Khubilai Khan, the Yuan state had the Grand Canal shortened significantly by as much as 700 kilometers. Workers did so by digging a canal through mountainous Shandong Province, thus creating a more direct route between Yangzhou and the new national capital of Beijing. The Grand Canal built under the Yuan dynasty was one of the features that enabled Beijing to remain the national capital under the Ming (1368–1644) and Qing (1644–1912) dynasties.

Tea and Textiles

During the Ming dynasty China underwent a major commercial revolution, once again spearheaded by the Yangzi River valley. Cotton emerged as a key commercial crop, and the Grand Canal became vital to the cotton industry. The Yangzi River valley became a leading producer of both raw and spun cotton, but the demand for raw cotton was so great that the Grand Canal was used to ship raw cotton from the north to the Yangzi River valley to be spun and woven into textiles. Meanwhile a commodities market in luxury goods such as silk and porcelain ware also flourished in China. Much of China’s silk and porcelain was also produced in the Yangzi River valley, and the best products were then shipped to Beijing. The Ming dynasty also traded heavily with the neighboring Mongols. The most significant items of trade were Chinese tea in exchange for Mongol horses. The Grand Canal was thus also used to transport tea grown in the southern coastal province of Fujian to the northern capital. The Qing dynasty continued to use the Grand Canal for similar purposes, although by the late nineteenth century the growth of a new railway system competed with the canal as a means for transporting grain and other supplies. Yet railways never completely supplanted the canal, and it is still used today to transport vast quantities of heavy goods between north and south China, including bricks, gravel, sand, diesel fuel, and coal.

Grasslands, which constitute 41 percent of China’s territory, exist in desert, semi-arid, and moist forest ecological zones of the country. The Chinese government has taken action since the mid-1980s to preserve and protect this important environmental and economic resource.

Although China is perhaps best known in the West for its rice-growing eastern landscapes, China ranks second among the countries of the world (behind Australia) in terms of its total area in grassland. Grasslands extend over 41 percent of China’s territory. Together, these 393 million hectares of grasslands, located primarily across vast reaches of China’s north, northwest, and western regions with smaller areas in the highlands of the southwest, constitute China’s largest biogeographic region. These grasslands support a great diversity of flora and fauna, are homeland to a number of different peoples, especially the Tibetans and the Mongols, and provide the raw materials for a wide range of industries, from medicinal plants to dairy products. They are also the locus of some of China’s most threatened environments.

Physiographic Features

Although there are grasslands and meadows scattered throughout much of China (small areas of grassland are most numerous in southwestern China), the two largest areas of grassland are found in Inner Mongolia (the northern grassland) and on the Qinghai–Tibetan Plateau (the alpine grasslands). The grasslands follow the patterns of China’s climatic regions. In western, interior China, where the Himalaya and the Tibetan Plateau form a formidable barrier to the transport of moisture, semi-arid, arid, and desert-like conditions prevail, and the grasses grow short, tough, and sparse. Moisture increases from west to east until the moist summer monsoon patterns that come from the southeast overcome the arid winds of the west, and the grass gradually becomes taller and more lush. In the moist forests of northeastern China (Liaoning, Jilin, and Heilongjiang provinces), well-watered, green meadows fill the spaces between the tall trees. But most of China’s grassland area is found in more arid regions. (See table 1 for a list of grassland species and the types of climates in which they thrive.)

The northern grassland, located primarily in Inner Mongolia, constitutes 48 percent of China’s grassland area. It ranges from low desert and steppe vegetation in the arid west to relatively tall grasses in the more moist environments of the east, and comprises grasslands of the northeastern plateau, the Inner Mongolian Plateau. In the west, the dry, desert-grassland areas of Inner Mongolia’s Ordos Plateau and parts of Gansu Province, the Ningxia Autonomous Region, and the Xinjiang Autonomous Region are characterized by drought-resistant Stipa and Artemesia grass species as well as numerous annual plants. Most of the vegetation in these arid regions averages 23 to 30 centimeters in height. At its eastern extreme, in the northeast China plain forest-steppe region, the grass species include “sheep’s grass” (Aneurolepidium chinensis, Stipa baicalensis,
Grasslands

which averages 50 to 80 centimeters in height, and *Filifolium sibiricum*. Between these extremes, the temperate grasslands of the Inner Mongolian Plateau provide some of China’s richest grazing lands, dominated by *Aneurolepidium pseudoagropyrum, S. grandis, and S. krylovii*.

Animal species found in the northern grassland region include the Mongolian gazelle (*Gazella gutturosa*), Przewalski’s horse (*Equus caballus przewalskii*), foxes, wolves, as well as numerous bird species.

The alpine grasslands of China are found primarily on the Qinghai–Tibetan Plateau, which averages more than 4,000 meters elevation. Grasslands cover 68 percent of the Tibetan Autonomous Region (approximately 82 million hectares), and 60 percent of the entire Qinghai–Tibetan Plateau. Northwestern Tibet is characterized by dry, desert-like conditions, but as moisture increases from northwest to southeast, the grasslands become increasingly lush.

Grasses in the alpine grasslands average 15 to 20 centimeters in height and tend to cover 30 to 50 percent of the ground. Other vegetation in alpine grasslands includes low-lying plants such as cushion plants, plum, saxifrage, and dwarf juniper. On the southern Qinghai–Tibetan Plateau, the primary grassland species are *S. bungeana, Aristida triseta, Pennisetem flaccidem,* and *Oinus thoroldii*. At elevations above 4,400 meters, the grassland transitions to *S. purpurea, Artemisia wellbyi, A. younghusbandii,* and *A. stracheyi*. Above about 5,000 meters, the alpine meadows are dominated by *Kobresia pygmaea* and *Carex montis-everestii*. In the northern reaches of the plateau, the dominant grass species include *S. krylovii, S. brevisflora,* and *A. frigida*.

The alpine grasslands of Tibet are home to a wide range of animal and bird species. The most notable of these are large mammals such as wild yak (*Bos gruniens*), Tibetan antelope (*Pantholops hodgsoni*), Tibetan gazelles (*Procapra picticaudata*), Himalayan blue sheep (*Pseudois nayaur*), and Tibetan wild asses (*Equus hemionus*), as well as predators such as brown bears (*Ursus arctos*), wolves (*Canis lupus*), and snow leopards (*Panthera uncia*).

There are also alpine grasslands in Sichuan and in the Kunlun Shan, Altay Shan, Tian Shan and the Qilian Shan.

### Human Geography

These vast grassland areas have served as homelands for a number of different nomadic peoples over the long span of history for which there is archeological or historical evidence. The ancestors of the Chinese first encountered the peoples of the northern grasslands during the

</table>

fourth century BCE. Over a long history of alternating wet and dry, cold and warm periods, a succession of different peoples—some inhabiting year-round permanent settlements, others living nomadic or semi-nomadic lifestyles as they grazed their herds—thrived in these vast grasslands. Powerful confederations of nomadic tribes arose in the grasslands, such as the Xiongnu (sometimes referred to as the Huns), who became a regional power in the third century BCE, and the Mongols, who were united by Chinggus (also known as Genghis) Khan during the twelfth century. A Tibetan empire arose in the seventh century.

The grasslands were home not only to nomads but also to significant cities: Lhasa (Tibet), Xining (Qinghai), and Hohhot (Inner Mongolia), for example, are all major cities that have flourished for centuries in the grasslands. The eastern and southern reaches of the grasslands of Tibet and Inner Mongolia have also supported agricultural settlements. The Tibetans and Mongols have very distinct cultures, languages, and traditions. But they have shared some common history and culture since the sixteenth century, when Tibetan Buddhism became the primary religion of the Mongols.

Today the vast expanses of the Inner Mongolian and the Qinghai–Tibetan grasslands are sparsely inhabited, in comparison to eastern China, by peoples of Mongol and Tibetan heritage. But they are also home, especially since the founding of the People’s Republic of China, to increasing numbers of Han Chinese migrants from eastern China. For example (not accounting for boundary changes) the population of Inner Mongolia was about 6.1 million in 1953, and by 2006 was estimated at nearly 24 million. Most of the difference in population is a result of Chinese in-migration: there are now about 4 million Mongols and 19 million Han Chinese living in Inner Mongolia. Qinghai Province has seen a population increase from about 1.7 million in 1953 to about 5.5 million as of 2006, of which nearly 3 million are Han Chinese.
Economic Geography

The grasslands provide subsistence for a number of different nomadic and semi-nomadic peoples. As is common with this type of subsistence system, herds of animals graze on the natural grasses and shrubs for a period of time until those resources are depleted, then the herds (and often the settlement, as well) move on to a fresh area of grass. The grazed grass is allowed to renew in order to serve as fodder again in the future. This type of system works well on the grasslands for a wide range of livestock such as horses, sheep, goats, and yak. These sophisticated subsistence systems have been endangered in recent years by changing land-tenure systems and economic and political pressures on the nomads to settle in one place.

Historically, the grasslands were important to China as a supplier of both a wide range of products (particularly livestock, livestock products, and medicinal plants) and knowledge. The grassland sheep supplied wool for Chinese carpets; horses raised on the grasslands carried the Chinese armies to their battles. Horsemanship in particular was an area of knowledge imported from the grasslands: Stirrups, saddles, and other technologies were often first developed or improved in the grasslands. During the Qing dynasty (1644–1912), a widespread system of trade with the peoples of the northern grasslands developed and became so important to China that the trade routes were protected by imperial decree.

Today the Chinese grasslands are the primary loci of a number of China’s livestock industries. The grasslands of Inner Mongolia, Xinjiang, Tibet, Qinghai, Sichuan, and Gansu account for 70 percent of China’s sheep, 100 percent of the camels, 44 percent of the horses, 39 percent of the donkeys, and 25 percent of the country’s cattle and goats. In the past the raw materials of the grasslands were often sent east for processing. In recent years there have been

Woman and child in folk dress, resting on China’s grasslands. PHOTO BY JOAN LEBOLD COHEN.
increasing efforts to establish production facilities in or near the grasslands themselves in order to provide a better livelihood for the people who live there. Of these, the dairy and wool industries have been the most successful.

Environmental Issues and the Grasslands

The Chinese grasslands began receiving wider attention both in China and abroad during the late 1980s as China's scientific community came to a consensus: The grasslands were becoming increasingly degraded, and the degradation of the grasslands—as bare soil became exposed, dried, and blown by prevailing winds—became known as one of China's most significant environmental issues. This degradation, which many scientists believe leads to increases in desert area (desertification), is believed to be exacerbated by overgrazing of grasslands by herders. The rate of desertification in many of China's grassland areas may have doubled since the late 1970s, as economic development has led to greater economic uses of the grasslands. Chinese scientists estimate that about 10 percent of the grasslands were degraded in 1970, but that the amount of degradation has increased to about 30 percent in recent years, about 118 million hectares of degraded grasslands as of 2008.

In order to protect the environment of much of China (not just the grasslands themselves, but also the wide regions plagued by increasingly frequent dust storms across northern China), the Chinese government has worked to reclaim or restore the grasslands by relocating herders, by reorganizing agricultural and pastoral systems on the grasslands, and in some cases by replanting grasslands or reforesting nearby slopes to cut the wind. There are a number of major programs to carry out these changes, especially the Northern Shelterbelt Program, which is aimed at restoring grasslands and forest across a wide swath of northern China in order to reduce soil erosion.

Protected Areas

Under the laws of the People's Republic of China, all grasslands are owned by the state. A national grasslands law passed in 1985 specifically forbids any activities that would harm the grasslands and requires local authorities to close degraded areas until those areas recover. These general provisions have been strengthened through designation of grasslands as protected areas. For example, a number of grasslands in China have been designated as nature reserves. The first of these, designated by the national government in 1985, is located on the Xilin Gol grassland of Inner Mongolia. In 1987 the Xilin Gol grassland, one of China's largest contiguous grassland areas, was recognized by UNESCO as an International Biosphere Reserve. There are numerous nature reserves on the Qinghai–Tibetan Plateau, including the Changtang Nature Reserve, a vast protected area covering about 247,000 square kilometers that was established by the national government in 1992.

Grassland Tourism

Some of China's grasslands have become tourist destinations in recent years. In Inner Mongolia, tourist resorts where visitors can stay in yurts, eat Mongol foods, and attend Mongol cultural performances have become popular with both international and domestic tourists. And the recently opened railroad crossing the Qinghai–Tibetan Plateau from Golmud, Qinghai, to Lhasa, Tibet, has also provided new opportunities for tourists to experience the grasslands landscapes. In Inner Mongolia, Tibet, and Qinghai, promotion of grassland tourism has resulted in the construction of new tourist-oriented settlements and in the marketing of local festivals and events. These take place primarily in the summer and often involve exhibitions of horsemanship, dancing, and contests of strength and endurance. In Inner Mongolia alone there are ten different summer festivals promoted for tourism, most of which are versions of Nadam, a traditional Mongol festival. Most of the Tibetan attractions are centered around traditional monastery events scheduled according to the Buddhist calendar.

Perspectives

The significance of the grasslands can be interpreted in many different ways. Are the grasslands an economic resource to be utilized to its fullest extent? A subsistence
resource? An environmental resource which provides biomass and carbon sequestration and protects against dust storms? A cherished homeland? Or the locus of a growing tourism industry? Although they are not necessarily mutually exclusive, these five perspectives—all of which can be found within China in the twenty-first century—have different implications for the management and future of the grasslands. In recent years the Chinese government has focused on creating policy initiatives aimed at making use of the economic potential of the grasslands while preserving them in order to protect the environment.

Great Britain–China Centre

Yīng-Zhōng Xiéhuì 英中协会

The Great Britain–China Centre promotes good relations between the two nations, focusing on legal, judicial, and labor reform.

The Great Britain–China Centre was founded on 16 July 1974 by British Foreign Secretary James Callaghan under the auspices of the British Council and with the help of the Foreign and Commonwealth Office. The center was created to provide greater nongovernmental contact between Britain and China and to promote cultural exchanges for the development of good relations between the two nations. Although in its early years the center’s mission was primarily cultural education, in recent years the mission has shifted to legal, judicial, and labor reform.

China and the outside world had little contact during the Cultural Revolution (1966–1976), but the West remained curious about China. Programs such as the Royal Academy’s “The Genius of China” exhibition in 1974, although important and well intentioned, fell short of satisfying British public interest in China and Chinese culture. The Great Britain–China Centre and the Great Britain–China Educational Trust, a fund that supports students studying Chinese language and culture, were established to help satisfy this general interest in China.

During its first decade the center hosted arts conservation programs, briefings for business people, cultural exchanges and visits by news delegations, sinologists, librarians, geographers, agricultural, and medical delegations, and business groups both to and from China. During its early years the center faced challenges because of Chinese objection to visits by certain cultural groups, including the Manchester United football club and the violinist and composer Yehudi Menuhin.

By 1984 China had undergone significant change and, with agreement on the question of Hong Kong settled by the 1984 Joint Declaration (which called for the return of Hong Kong to China no later than 30 June 1997), contact and activities flourished between the two nations. The center became a reference point for people engaging with China. It developed a newsletter, lecture programs, and a “Directory of British Organizations with an Interest in China” and provided Chinese-language classes.

The Tiananmen Square protests of 1989 changed the perspective of many people and put human rights at the forefront of relations with China. After the visit to China of a British human rights delegation in 1992, led by Lord Howe, the British foreign secretary during the Tiananmen Square incident, the center began to focus on legal reform. As the pace and variety of Sino-British links grew during the 1990s, the center continued to focus on legal and economic reform and to broaden its scope to include programs dealing with the environment, arts and humanities, public administration, and the media.

Since the 1990s the center’s mission has shifted slightly to the promotion of understanding between Britain and China in the areas of legal, judicial, and labor reform. The center operates exchange and research projects with Chinese partners and works with many organizations in the United Kingdom (U.K.) and China, including the Department for Constitutional Affairs, the Foreign and Commonwealth Office’s Global Opportunities Fund, and many others.
the All-Party Parliamentary China Group, the European Union Delegation in Beijing, the British Council, and the Ford Foundation. Projects include research seminars on the use of the death penalty in China, collaboration with the Ministry of Labor and Social Security on the establishment of labor arbitration courts to settle workers' disputes, and forums on legal reform and human rights. The center works with government ministries, universities, businesses, law firms, and research centers to conduct short-term and long-term exchanges, and it continues to develop contacts within both countries. The core of its efforts remains aimed at building the relationship between China and the United Kingdom.

The Editors

Further Reading

The Great Leap Forward was a campaign launched in 1958 by China’s leaders, particularly Mao Zedong, to use massive mobilization to advance in agricultural and industrial development. The campaign, which promoted people’s communes to remove economic incentives and encouraged the rural workforce to smelt iron in backyard furnaces, led directly to the Great Leap famine, the worst famine in human history.

The Great Leap Forward was the campaign launched by the Chinese Communist leadership in 1958 to catch up to and quickly leapfrog the economic growth of Great Britain and the United States. Having become disenchanted with the Soviet-style development strategy that prioritized heavy industry, China’s leaders, particularly Mao Zedong (1893–1976), believed that massive social mobilization would allow China to develop industry and agriculture simultaneously. Unfortunately, the campaign ended in utter failure and caused what is known today as the Great Leap famine.

Mao’s Successful Promotion of Large Collectives

Any explanation of the Great Leap must begin with the ideological preferences of Mao and his colleagues. Mao’s efforts to promote large collectives and communes were based on a belief in economies of scale—large (agricultural) units may lower production costs and increase efficiencies—and a desire to promote social equality. Even though Mao’s earlier pursuit of progressively larger rural institutions, ranging from mutual-aid groups to cooperatives and then to collectives, had caused many disruptions in agricultural production, the disruptions were dismissed as temporary. Mao forged on with his demands for larger collectives in the late 1950s.

The Chinese political system had no room for dissent at this time. Repeated political campaigns, particularly the Anti-Rightist Campaign of 1957, had banished to hard labor and even imprisonment those (primarily intellectuals) who spoke up against the party. Those who raised questions a little later about Great Leap–policy practices, such as Defense Minister Peng Dehuai (1898–1974), were persecuted as Rightist opportunists. In such a political system, those who aspired to mobility on the political ladder of success watched for cues of Mao’s preferences and eagerly supported everything that Mao liked.

Once Mao endorsed the term “people’s commune” in early August 1958, local leaders and political activists raced to establish communes and competed to build ever larger ones. The number of communes proliferated. In just two months, most provinces claimed a successful transition to people’s communes. Rural China was organized into 26,500 gigantic communes, each averaging 4,756 households. (Yang 1996, 36.) The communes abolished private property and, in most cases, did away with all economic incentives, such as tying remuneration to the amount of work done. The commune mess...
hall epitomized the frenzy of the Great Leap. Commune members were encouraged to abandon their private kitchens, donate the pots and pans to backyard iron furnaces, and dine in communal mess halls so that women could join the labor force.

The Free-Supply System and Other Wasteful Practices

Amid the euphoria of Communist transition, China’s leaders ceased to manage the economy but instead encouraged practices that, in hindsight, were downright criminal. The state statistical system stopped functioning and was replaced by wild claims of bountiful harvests. Such claims in turn engendered wildly exaggerated output forecasts and prompted prominent regional leaders such as Ke Qingshi (1902–1965) and Tan Zhenlin (1902–1983) to exhort peasants to eat as much as they could. As a consequence, the free-supply system was widely adopted, and the mess hall became the site of communal feasts in many places. The free-supply system induced over-consumption and the waste of food, even while state grain procurement was increased sharply on the basis of highly inflated output forecasts. With worsening Sino-Soviet relations, the Chinese leadership increased grain exports, again under the illusion of bountiful harvests, to accelerate China’s debt repayment to the Soviet Union.

Other practices, including the massive diversion of rural labor to backyard iron furnaces and water-conservation projects, led to gross neglect in harvesting the bumper crops of 1958 and contributed to the ensuing famine. By spring 1959, many communes, caught between higher
government procurement and free supply, had exhausted their grain reserves and witnessed a collapse of work morale. At this point, much still could have been done to avoid the worst of the famine. Unfortunately, during the Lushan Conference of 1959, in which he came down hard on Peng Dehuai, Mao unleashed a “second leap” and another push for communal mess halls. This further exacerbated the rural situation and undoubtedly contributed to the jump in China’s mortality rates from 12 per 1,000 in 1958 to 14.6 per 1,000 in 1959 and 25.4 per 1,000 in 1960, according to official Chinese statistics released in the post-Mao era. The statistics reveal that those provinces that had a higher mess-hall participation rate at the end of 1959 also tended to have a higher mortality rate in 1960, the year that China had a net population loss of 10 million people.

**Effects of the Great Leap Famine**

The Great Leap famine was thus clearly rooted in politics rather than nature. Unfortunately, the peasants who had put their faith in Mao’s regime were largely left to fend for themselves when they had exhausted their food supplies. The demographer Judith Banister estimated that the number of excess deaths, i.e., the number of deaths compared to what would have been the case had there been no famine, from 1958 to 1961 was between 15 and 30 million. In aggregate numbers, the Great Leap famine is the worst famine in human history. The incidence of the famine was emphatically rural, with the grain producers becoming the main victims of famine.
The intensity and magnitude of the Great Leap famine far exceeded the Great Depression in the United States and produced a lasting change in Chinese preferences and behavior. It shattered any nascent beliefs the rural people might have had about large rural organizations and led them to question government policies. It also prompted Mao and his colleagues to moderate rural policies and scale down the sizes of rural collective organizations. But the famine also induced fissures among the top leaders. As Mao turned his attention away from the economy, he launched the notorious Cultural Revolution in 1966.

While the basic collective institutions were maintained during Mao’s lifetime, the famine profoundly undermined popular support for such institutions and laid the foundation for China’s eventual decollectivization, or dismantlement of collective institutions in rural areas, following Mao’s death. Through the early 1980s, the provinces that had suffered more severely during the famine were less likely to adopt radical rural policies and institutions. Following Mao’s death in 1976 and the defeat of radical leaders, farmers again turned to household contracting (contracting land to the individual household), particularly in those areas that had suffered the most during the famine. By the turn of the 1980s, the national leadership, now led by Deng Xiaoping (1904–1997), had embraced rural decollectivization. The Great Leap famine was thus not just a monumental tragedy; it also laid the groundwork for institutional innovation. It is a great historical irony that the Great Leap Forward, launched to accelerate China’s march toward communism, actually served to hasten the arrival of market reforms by precipitating the greatest famine in human history. The tragedy is that China had to go through such a terrible detour.

Great Wall
Chángchéng 长城

The Great Wall (changcheng or wanli changcheng) is a series of defensive walls built in northern China between the fifth century BCE and the nineteenth century. These walls played a role in defending China from incursions by northern steppe peoples, particularly the Mongols during the Ming dynasty (1368–1644).

Although the term Great Wall suggests a unitary structure, in reality there is no singular Great Wall but rather a series of border walls (bian qiang) built in different regions of northern China in different periods using different building techniques and materials. The most widely recognized areas of the Great Wall today are those walls and towers built north of Beijing in the late sixteenth and early seventeenth century out of quarried stones, bricks, and mortar. Although many sources give an approximate length of the Great Wall, there is no effective way to determine the length of all of the border walls, nor have they all been discovered or surveyed in modern times.

Wall-Building in Ancient China

During the Warring States period (475–221 BCE), in order to create a barrier against invading armies, states in northern China built border walls out of pounded earth or dry fieldstone (states not in northern China also built border walls). These walls were partially consolidated and expanded under the Qin dynasty (221–206 BCE), which continued to use the same building techniques. More walls were built along northern borders under the Han dynasty (206 BCE–220 CE), when incursions from northern steppe warriors known as “Xiongnu” were common. By the end of the Han dynasty border walls stretched from present-day Gansu to the Korean Peninsula, although these walls were by no means continuous. Subsequent dynasties continued to build walls sporadically, but the next large-scale wall-building effort by a unified Chinese empire was not until the Ming dynasty (1368–1644).

Wall-Building in the Ming Dynasty

Although the first high-profile wall-building campaign took place in Liaodong in the 1440s, the most important wall-building projects in the last one hundred years of the dynasty were those designed to protect the Ming capital established by the Yongle emperor (reigned 1402–1423). Beijing is located on a flat plain surrounded to the northwest, north, and northeast by formidable chains of mountains. Yet, two major passes that run through the mountains to the northwest and northeast made the capital vulnerable to raids from the Mongols. One pass runs through the area of Great Wall known today as “Badaling.” The other runs along the Chao River, passing the Great Wall at Gubeikou near the present-day Great Wall tourist sites of Jinshanling and Simatai.
In the 1540s the Altan khan (1507–1582), a descendant of Chinggis (also spelled Genghis) Khan, gained control of the eastern Mongols and plagued the Chinese borderlands to the west. In 1550, after the Ming Jiajing emperor (reigned 1521–1566) declared a no-trade policy, the Altan khan led a major raid on the capital city, leading thousands of Mongol horsemen to the edge of the walled city. Thousands of Chinese living around Beijing were slaughtered and thousands of head of livestock brought back to Mongol territory.

The immediate result was a major wall-building campaign that lasted for the next three decades. The Ming dynasty decided to fortify existing walls and build new ones along the mountain ranges north of Beijing. Most of these walls used unquarried fieldstone but used lime-based mortar to hold the stones together. In 1554 Ming soldiers stationed along the wall in the area of Gubeikou succeeded in repulsing a major Mongol raid. The raiders moved eastward to the area known today as Jinshanling, where they were again repulsed by Ming soldiers. They continued to move eastward to the Great Wall area of Simatai but did not succeed in penetrating the Ming defenses.

In 1568 the Longqing emperor (reigned 1566–1572) invited two of China’s leading military strategists, the general Qi Jiguang and the scholar-official Tan Lun, to the capital to help design Beijing’s defense strategy. The two Ming officials promptly recommended that the Ming dynasty build three thousand brick towers along the border walls where soldiers could be stationed and could store key supplies such as grain, gunpowder, and weapons. That number was eventually scaled down to twelve hundred, and building commenced the next year. The towers were built out of kiln-fired bricks and mortar and were strategically placed at intervals along the ridgelines and on peaks.

An aerial view of the Great Wall shows its expansive reach and fortification points across the mountains. Photo by Tom Christensen.
In 1576, after an unsuccessful attempt to threaten the Ming officer in charge of the area into giving presents such as iron pots, silver, cloth, and grain, a small Mongol tribe launched another raid on Ming territory north of Beijing. The tribe crossed over to Ming territory and attacked a fort, killing eighteen soldiers. Soldiers who chased the tribe back into Mongol territory met their deaths in an ambush. Although the body count was low, this event prompted the Ming dynasty to begin building walls out of bricks and mortar. Eventually a few hot spots along the wall north of Beijing were fortified in this way. In most cases the Ming soldiers built the walls over existing structures.

Today the Ming Great Wall north of Beijing is one of China’s most important tourist sites and one of its most powerful symbols. Although the walls and towers sustained significant erosion owing to the elements and natural forces, as well as the dismantling of certain sections of the Great Wall by peasants in nearby villages who used them to build their houses (this practice was encouraged during the rule of Chinese Communist Party leader Mao Zedong), many of the walls and towers have been quite well preserved—a testament to the craftsmanship of their builders. In the 1980s the Chinese government began to reconstruct certain areas of the Great Wall north of Beijing to be designated as official tourist sites (this reconstruction actually began in the 1950s with Badaling). These areas include Badaling, Mutianyu, Jinshaling, and Simatai. In most cases an effort was made to restore the walls and towers to their original condition. In other cases, such as Simatai, many of the walls and towers were reinforced but left in the condition they were in to give people a more authentic picture of how the walls have fared over the past five hundred years or so.

Great West Development Plan

China’s economy has been experiencing double-digit growth for over a dozen years. However, this miraculous increase hasn’t spread wealth equally throughout China. The comparatively sluggish economy in western parts of China could easily disrupt the nation’s rapid development as a whole, while environmental, ethnic minority issues, and allocations of natural and human resources only complicates matters.

China has been growing economically with great speed, but the benefit of this growth is not shared evenly within the country. Some eastern areas of China, such as Guangdong, Zhejiang, and Shanghai, are doing well, whereas the western regions of the country such as Guizhou, Tibet, and Gansu are having trouble modernizing, and this gap is growing.

Rather than ignore these disparities, in 1999 China’s then-Communist Party chairman Jiang Zemin introduced the Great West Development Plan and stressed the importance of a balanced economic development between the west and east of China. In 2000 the Great West Development Plan was divided into several projects addressing natural conservation, human resource improvement, and industrial development.

The “Great West” refers to the provinces and cities of Chongqing, Sichuan, Guizhou, Yunnan, Shanxi, Gansu, and Qinghai and the autonomous regions of Tibet (Xizang, Ningxia Hui, Xinjiang Uygur, Inner Mongolia, and Guangxi Zhuang. This area covers 71.4 percent of China’s territory (6.85 million square kilometers) and holds 28.8 percent of China’s population (about 367 million people); it is a resource reserve with great market potential for the entire country’s economic growth. Therefore, the Great West Development Plan focuses on more than reducing the income gap between east and west.

Gross domestic product (GDP), the total market value of goods and services produced in an area in a given period, usually a year, is a useful indicator of that area’s development. The GDP of western China accounts for only about 16.8 percent of the national total. Moreover, the per capita GDP of the west is only two-thirds of the national average and less than 40 percent of the per capita GDP of eastern China.

Goals of the Plan

The Great West Development Plan is a difficult but necessary project. According to the plan, within the first ten years of the twenty-first century the infrastructure of the west will be largely enhanced and the ecological environment preserved (the “catch-up steps”), while advantageous industries should be promoted and people’s living standard should be improved (the “developing steps”). If the plan is carried out, by 2050 there will be a new west with a sustainable natural environment, prosperous economy, and stable society.

To quicken development in the west, the plan specifies a need for policies that will support the growth of
investments, taxes, education, and human and natural resources. Therefore, not only an environmentally friendly course of action based on scientific and technological advances, but also a lucrative market for investing through secure and smooth capital channels will be necessary for the plan’s success.

Key Points of the Plan
Infrastructure is the starting point of the plan. To prepare for economic development, efficient infrastructure, such as transportation networks including roads, railways, and airports, is needed. Also needed are a natural gas pipeline, a communication network, an electrical grid, broadcasting networks, and water projects.

Ecological conservation is a “catch-up procedure” for the sacrifices made for previous unplanned growth-oriented development on one hand and a future sustainable growth environment on the other. Large areas of land in the west, once fertile forests or grasslands, were of vital importance for the fragile ecology. These regions were altered for economic benefit, and now the gray, barren soils needs to be cultivated and coaxed back into green forest and grassland reserve, even though it means a short-term economic loss.

Industrial structure adjustment and adaptability will help the west create a niche in future development. The east has capital and technology, but the west has other advantages. Agriculture should be upgraded with support from science, technology, and information to benefit not only local farmers but also the whole country. Natural resources need to be utilized efficiently to promote the transition from a dependency on these resources to a broader economic base. In addition, tertiary industry that is resource efficient and labor intensive, such as tourism, should be encouraged.

Education creates talent, which is the engine for social progress. However, in China’s five minority autonomous regions of the west (Guangxi Zhuang, Inner Mongolia, Ningxia Hui, Xinjiang Uygur, and Tibet (Xizang) education is not well developed.

Reform and open-door policies brought successes to the east of China, and such successes can be taken as a reference point for the west. The west needs to adopt preferential policies to stimulate economic activity. State-owned enterprises still need to be adapted to market-oriented economy mechanisms.

The foregoing points have been supported by policies of the central government. For example, in the period 2001–2010, enterprises in encouraged industries enjoy a 15 percent income tax waiver; new enterprises in transportation, electricity, water projects, and broadcasting enjoy two years of income tax waivers and three years of half income tax after being established; farmers’ income from planting trees and grass is tax free for ten years.

What the Plan Means
As a regional development plan, the Great West Development Plan is regarded as a national strategy because the plan may not only reduce the gap between the west and the east but also stimulate development in China as a whole. For the five minority autonomous regions stability will be one of the top priorities. Less-developed minority areas can be a weak link in the chain of stability, and the plan seeks to achieve overall prosperity by focusing on economic development and social progress in these remote areas, and by tapping into both the west’s vast resource reservoir and its large market, the potential of which is far from being fully explored. After a decade of double-digit economic growth, China has the capacity to fully implement the Great West Development Plan to everyone’s benefit.

Barriers to Investment in Western China

Many companies continue to hesitate when it comes making large investments in western China. Infrastructure, business support systems, and government practices are all reasons why companies hold back.

Unskilled labor in western China is still very low paid (manufacturing wages are a dramatic 40–50 percent less than they are in the main coastal provinces), but this advantage for foreign companies is counterbalanced by difficulties in locating skilled labor and a decrease in productivity. Although facilities in western China do not require migrant labor and therefore have significantly lower turnover rates than their counterparts in the east, the pool of available high-quality mid-level managers and engineers is smaller, and companies may have to pay a premium to have senior-level managers move from the east.

While the central government is investing heavily in infrastructure projects in western China, the region still lags behind the east. To ship a “standard” truckload from the nearest major port to most major cities within the “Go West” regions costs between $500 and $1,000 and requires one to three days. River transport is only a third of the price of trucking, but it is slow and has limited capacity. Rail links also suffer from limited capacity due to a focus on passenger transport; they can only meet 30–40 percent of demand in the key Yangzi corridor. Air links are still developing and are relatively expensive. Power is generally less expensive than in the east, but reliability can be an issue.

When it comes to business support, foreign companies find that most local suppliers are not developed or sophisticated. Much more time and effort is required to find, qualify, and develop them to meet customer requirements. In addition, western China cannot easily accommodate foreign companies’ need for such sophisticated support services as accounting, consulting, architecture, design, and so forth.

Government policies and regulations are more inconsistent in western China. Intellectual property and environmental regulations exist, but are less stringently enforced than in coastal China.

Greater Xing’an Range

Dàxìng‘ān Lìng 大兴安岭

Greater Xing’an, a sparsely inhabited mountain range in northeastern China, is one of the country’s most important timber areas and home to a wide variety of natural resources, including many used in traditional Chinese medicine. Deforestation has become a problem in the mountain range.

The Greater Xing’an range (Da Xing’an ling) is a crescent-shaped mountain range extending 1,400 kilometers from south to north in the northwestern parts of Heilongjiang and Jilin provinces in northeastern China. The Greater Xing’an range is one of China’s most important timber areas. Other major natural resources include gold, marble, coal, charcoal, and peat. Deposits of silver, copper, iron, titanium, and other metals also have been detected. The area is also known for its many mineral springs as well as a vast variety of plants and herbs used in traditional Chinese medicine.

The Taoer River, running near the border between the two provinces, divides the range into a 100-kilometer-wide southern part and a 2,300-kilometer-wide northern part. The northern part of the range runs for about 670 kilometers, with smooth and rounded peaks rising 1,000 meters above sea level; a few, such as Mount Fengshui and Mount Dajiluqina, reach over 1,390 meters. The eastern slopes are steep; the western slopes merge into the Inner Mongolia Plateau, which is about 700 meters above sea level. It is an exceedingly cold area, with winters lasting more than eight months and an average temperature in January of –28° C. A record low for the area of –52.3° C was recorded in 1969, and permafrost is widespread. The brief but mild and relatively wet summers with an August average temperature of 15° C make a three-month growing season possible. The southern part generally consists of lower mountains and has a somewhat warmer and drier climate. Here grassland and mixed deciduous trees of aspen, oak, willow, and elm have taken the place of the dominant coniferous forests of the northern range.

Since the construction of several railways into the mountains in the 1930s, the region has been heavily deforested, which is increasingly threatening the ecological balance. Between 1960 and 1980 cultivation of farmland has pushed the tree line about 100 kilometers to the north. In 1987 a fire devastated over 1 million hectares of trees, reducing the forest cover of the mountains by an estimated 14.5 percent. This deforestation seriously affected the biodiversity (biological diversity in an environment as indicated by numbers of different species of plants and animals) and climate of the area and has had a critical impact on wildlife such as the already threatened population of brown bears.

The range is sparsely inhabited by ethnic groups, of which the Oroqen and Evenki (or Ewenke), who settled the area in the seventeenth century, are the most numerous. Both were originally nomadic people who bred reindeer, hunted, fished, and gathered wild herbs and fruits. Since the 1950s hunting and forestry have been their main sources of income, while some agricultural products for local consumption have been grown in the lower valleys. Since 1996 hunting prohibitions to protect wildlife have been enforced with increasing strictness by the Chinese...
One of “China’s Greatest Autumn Forests”

While many Western tourists have focused on well-known sites such as the Forbidden City, the Great Wall, and the Terracotta Army at Xi’an, those more familiar with China highlight other attractions, including ancient forests. This text comes from a website extolling the glories of an autumn day spent in the mountains.

Leaving Beijing or Shanghai for Northern Heilongjiang is like leaving Odessa or Moscow for Siberia. The Great Xing’an would be in Siberia, but for the Heilongjiang River, and sits at a higher elevation. The thousand-mile stretch is almost exclusively preserved virgin forest, China’s largest reserve of such, and a cornucopia of ecological diversity, although packed in ice much of the time. Visit late in the year at your own peril; with a good Oroqen guide you may live to see the northern lights.

The Oroqens are one of China’s most fascinating minorities, native to this region, and their lifestyle (until recently) reflects much of what is fascinating about this remote forest realm. They’ve been known by the Han for hundreds of years as both “the Hunting Clan”, and “the Deer-using Clan.” With such a short growing season and such a profusion of game, from the four footed in the hills to the finned in the rivers, the Oroqen had no reason to seek sustenance from the soil. The deer that they domesticated are actually reindeer, showing that these people and their lives are as Arctic as the Laplanders.

Not until the 1950s were the first families of Oroqen goaded out of their forest retreats and put in vaguely urban centers, but there are still some making a life in the forests, and worshiping their gods of fire and stone. If getting to the leafy heart of darkness is your kick, you can’t go far wrong with Xing’an, although you’ll go far by train—a twelve hour ride from Harbin to Jagdaqi, what passes for a major city in those parts.

The Green Gang (Qing bang), the most famous and feared secret society in late Qing and Republican China, was centered in Shanghai and controlled most of the city’s criminal rackets. Under the leadership of Du Yuesheng, the Green Gang rose to national prominence in the 1930s.

The Green Gang was the most famous secret-society/underworld-gangster organization in twentieth-century China, controlling a vast array of rackets, primarily in Shanghai, including opium trafficking, prostitution, armed robbery, extortion, kidnapping, child slavery, gambling, and illegal arms sales.

Emerging in the late nineteenth and early twentieth centuries from an earlier criminal/fraternal organization known as the “Friends of the Way of Tranquility and Purity” (Anqing daoyou), the Green Gang itself claimed descent from the seventeenth-century “Three Patriarchs.” These men, Weng Yan, Qian Jian, and Pan Qing, were followers of the Luo sect of folk Buddhism popular among Grand Canal boatmen’s associations at the end of the Ming dynasty (1368–1644) and throughout the Qing dynasty (1644–1912). The Friends of the Way flourished in Shanghai in the middle of the nineteenth century as thousands of displaced peoples from the Taiping Rebellion fled to the city, where they found work and protection among the salt smugglers. Gradually, although historical evidence remains sketchy, certain branches of the Friends of the Way split off and formed the Green Gang.

The Green Gang’s rapid expansion in the Shanghai underworld was fostered by the semicolonial structure of the urban environment. Shanghai at the time was divided into three cities—the Chinese city of Nanshi, the French Concession, and the International Settlement, each of which had jurisdiction over its territory. With its headquarters in one jurisdiction the Green Gang carried out its criminal enterprises in the other two with virtual carte blanche. To aid its criminal activities the Green Gang had many members highly placed in police departments throughout the city.

In the 1920s and 1930s famous Green Gang leaders such as Du Yuesheng (1888–1951), Huang Jinrong (1868–1953), Zhang Renkui (1859–1945), Gu Zhuxuan (1885–1956), and Zhang Xiaolin (1877–1940) brought the Green Gang into the realm of national politics and economic life. With a stranglehold on opium trafficking thanks to an agreement with the authorities in the French Concession, the Green Gang used its considerable profits to become an urban power broker and part of the fabric of everyday Shanghai life.

Throughout the Republican era (1912–1949) the organizationally strong but ideologically weak gang made alliances with whichever political force would best help maintain its interests. At various times the Green Gang forged alliances with warlords, the Nationalist Party (Guomindang), the Communist Party, and even the Japanese during World War II. Most famously, the Green Gang worked hand-in-hand with the Nationalist Party in the 12 April 1927 massacre of five thousand alleged...
pro-Communist workers known as the “White Terror” (*baise kongbu*).

Du Yuesheng, the primary “leader” of the 1930s Green Gang, which was actually only a loose coterie of overlapping organizations, rose to national prominence and became a figure of Shanghai folklore as he took control of major industries, brokered deals between national workers’ unions and the government, and maintained his iron grip over the vast underworld of Shanghai crime.

The Green Gang declined as an organization when the Communists captured Shanghai in 1949, and most members fled to Hong Kong and Taiwan.

GU Yanwu

Gù Yánwǔ 顧炎武

As a founding father of the school of Evidential Inquiry, Gu Yanwu abandoned the approaches of the Song and Ming neo-Confucianists and replaced them with a strong emphasis on scholarly textual criticism favored by Han dynasty scholars. Gu opened the path to a renaissance of studying the ancient Chinese classics, as well as advancing practical studies to deal with specific problems that China faced.

Gu Yanwu was a great scholar during the Ming (1368–1644) and Qing (1644–1912) dynasties who exerted a profound influence over Qing scholarship. He is widely recognized as the founding master of the school of Evidential Inquiry (Kaoju xue 考據學) or Han Learning (Hanxue 漢學).

A native of Kunshan, Jiangsu Province, Gu was born into a wealthy family that had held government posts for many generations. At the age of fifteen, Gu joined Fushe, a literary association that was deeply involved in politics. While Ming China was falling into the hands of the Manchu armies, Gu joined an anti-Manchu resistance movement. The outcome of the Manchu invasion was especially tragic for Gu and his family: his hometown was sacked, his two brothers were killed, Manchu soldiers cut off the right arm of his biological mother, and his foster mother committed suicide by fasting. Gu thereafter became an ardent nationalist and Ming loyalist who, throughout his life, refused to serve the Manchus; he scorned those who served the new dynasty for material benefits. Many twentieth-century Chinese nationalists, when facing the crises of Western and Japanese invasions, were continually inspired by Gu’s most patriotic expression that “every ordinary Chinese has a responsibility” to defend the Chinese civilization.

Gu detested the once-flourishing neo-Confucian studies advanced by scholars like Zhu Xi (1130-1200) and Wang Yangming (1472-1529) of the Song (960–1279) and Ming dynasties. Gu characterized the Song neo-Confucian scholars as being only interested in volubly and subjectively expressing their unrestrained opinions on abstract Confucian ethical principles. He further criticized the Ming neo-Confucian scholars for being obsessed with their own inwardly orientated meditative self-reflections on the vague and illusive goodness of human mind and human nature while taking no specific actions to do what the ancient sages said. Regarding these studies as having dealt with no practical problems faced by society and government, Gu satirized them as chan 禪 (a translation of the Sanskrit term dhyāna, meaning “sitting quietly to do meditation”) studies or empty studies.

Promoting a new type of learning, Gu insisted on returning to the study of the Confucian classics themselves and not the willful interpretations of the Song and Ming neo-Confucianists; he argued for an accurate restoration of the original texts of the classics and the correction of textual errors that occurred during the transcribing and printing processes in the past. Also, since these classics were written in ancient times, Gu claimed that philological researches and textual criticism were necessary to understand them. Gu believed that if anyone’s annotations
and interpretations of these ancient classics were more accurate, that should be those of the Han (206 BCE–220 CE) scholars, who lived closer to the time when the ancient classics were written. Gu thus urged scholars to thoroughly study the works of these Han scholars. Gu himself studied Han textual criticisms and methods and was later credited as the founder of the so-called school of Evidential Inquiry (Kaoju xue 考據學) or Han Learning (Hanxue 漢學), which flourished in the eighteenth and nineteenth centuries and had a powerful impact on Chinese linguistic (e.g., phonology) and culture studies.

Gu’s task was to clean up the loamy but distorted interpretations of the Song and Ming scholars and return to the simple teachings of the Confucian classics. Gu maintained that the value of the Confucian classics did not lie in their fancy words and sophisticated philosophical points, but in their usefulness in guiding people to behave properly and become filial, loyal, humane, and polite, as well as in guiding officials to govern justly, to make proper laws and regulations, to educate people, and to rectify people’s customs. Gu wrote many short essays, most of which were collected in his Rizhi lu (Records of Daily Knowledge), to clarify and correct past misinterpretations of the classical Confucian texts.

To show how a practical and useful knowledge, rather than the “useless and impractical” one produced by the Song and Ming scholars, could be pursued, Gu was the first in Chinese history to study systematically the phonology of the ancient Chinese language. With the re-establishment of the correct ancient pronunciations of Chinese characters and the understanding of how some pronunciations had changed over time, Gu believed that modern scholars could better understand how original texts of the Chinese classics should be read and interpreted, and thus restore the distortions done to these texts by scholars of the past.

After he failed civil service examinations in 1639, Gu abandoned for good all the lifeless studies-for-the-sake-of examinations, which focused mainly on memorizing Song neo-Confucianists’ annotations of the Confucian classics and on writing essays that followed fixed styles and format and had no intention of solving any actual political, economic, and social problems. Gu thereafter devoted his full energy to practical learning. Starting in 1657, Gu spent twenty some years traveling throughout northern China until he settled in Shaaxi for the remainder of his life. While traveling, he kept reading books, making new friends, collecting materials from places he visited, and writing constantly. In the early 1660s, Gu completed his practical learning masterpiece, the 100-chapter Tianxia junguo libing shu (The Book on Advantages and Problems Faced by Different Regions in the [Chinese] Empire). The book was an extensive collection of historical materials concerning regional customs, histories, geographies, military defense and supplies, agriculture, farmland conditions, river and irrigation systems, wasteland reclamations, grain transpiration, policies regarding taxations or salt production and trade, social unrests, and so forth. Meanwhile, Gu kept adding short essays and commentaries to his most important aforementioned scholarship collection, Rizhi lu, which remained unfinished at the end of his life. People can find in Rizhi lu’s 1,000-plus essays and commentaries Gu’s rich thoughts on statecraft—government operation and control, methods of selecting officials, taxation policies and management, rectification of ill social customs, and so on.

With all his efforts, Gu brought Confucian studies to a historical turning point where a more rational attitude was developed for handling the Confucian classics and where more practical issues concerning governance, national and regional agriculture, commerce, military defense, and society were to be tackled. Inspired by Gu, more Evidential Inquiry or Han Learning scholars hence emerged who not only reexamined and “objectively” annotated the main texts of the Chinese philosophical, historical, and literary classics, but also fostered a practical, rational, and even scientific approach to statecraft. Their efforts contributed to a renaissance of Chinese scholarly and cultural studies after centuries of dominance of Buddhist teachings and practices and helped to restore a confidence in the Chinese civilization at a sensitive historical moment when the alien Manchus still ruled China. Gu Yanwu’s important position in the Chinese intellectual history lies in the fact that, with his own brilliant groundbreaking scholarly accomplishments, he had laid down the most important foundation for all the new practical studies to blossom in the centuries that followed.

The Pursuit of Learning

While writing a letter to a friend, Gu Yanwu discusses and criticizes certain men’s pursuit of sagehood.

What then do I consider to be the way of the sage? I would say “extensively studying all learning” and “in your conduct having a sense of shame.” Everything from your own person up to the whole nation should be a matter of study. In everything from your personal position as a son, a subject, a brother, and a friend to all your comings and goings, your giving and taking, you should have things of which you would be ashamed. This sense of shame before others is a vital matter. It does not mean being ashamed of your clothing or the food you eat, but ashamed that there should be a single humble man or woman who does not enjoy the blessing that are his due. This is why Mencius said that “all things are complete in me” if I “examine myself and find sincerity.” Alas, if a scholar does not first define this sense of shame, he will have no basis as a person, and if he does not love antiquity and acquire broad knowledge, his learning will be vain and hollow. These baseless men with their hollow learning day after day pursue sagehood, and yet I perceive that with each day they only depart further from in.

GUAN Hanqing

Guān Hǎnqīng 关汉卿

1210/1220?–1300 Early dramatist

The Yuan dynasty dramatist Guan Hanqing wrote in the zaju format, a stylized form of theater usually in four acts. Scholars have likened his influence on Chinese theater to that of Shakespeare on Western theater.

Little is known about Guan Hanqing’s life. It has been said that he was born in Dadu (today’s Beijing), Qizhou of Hebei Province, or Jiezou of Shanxi Province. He was either a physician himself prior to becoming a dramatist or simply a member of a physician’s family.

One fact is certain: He was known as one of the four greatest dramatists of Yuanqu (melodious verse of Yuan), which is a generic name for Yuan Zaju (variety drama of Yuan), the national theatrical form of the Yuan dynasty (1279–1368). Yuan Zaju, or simply zaju, followed a rigid format. It had four, or occasionally five, acts and four roles in the cast, namely, dan (female), mo (male), jing (strong man or clown), and za (all other roles). Its performance involved singing, talking, and acting, but only the leading role could sing. Guan Hanqing authored sixty-seven zaju, eighteen of which have survived, including Dou E yuan (The Injustice Done to Dou E), Jiu fengchen (Saving a Prostitute), Wang jiang ting (River-Watching Pavilion), Bai yue ting (Moon-Worshipping Pavilion), Lu Zhailang (A Man of the Lu Studio), Dan dao hui (Meeting the Enemies Alone), and Tiao feng yue (Teasing an Unfaithful Lover).

Dou E yuan, also known as Liuyue xue (Snow of June), is the most famous of Guan Hanqing’s works. It is a tragedy about a young woman named Dou E, who is betrothed to the son of her father’s debtor but soon widowed. A hooligan named Zhang Lü’er covets Dou E’s beauty. When she rejects him he stealthily poisons the food that Dou E intends to feed her mother-in-law, but Zhang’s father accidentally eats it and dies. Zhang Lü’er then accuses Dou E of murdering his father. Taking Zhang’s bribe, the magistrate sentences Dou E to death. Dou E bewails her injustice, “Heaven, how can you misidentify the good from the bad? / Earth, how come you indiscriminate right and wrong?” (Guan, 1959). Before the execution, she asks that her blood drop not onto the ground, that snow fall to cover her body in midsummer, and that a three-year drought hit the magistrate’s county—all as a divine revelation of her innocence. Then her spirit appears before her father, who has become a high-ranking official after a successful civil examination financed by borrowed money. Eventually the father avenges Dou E by punishing Zhang Lü’er and the magistrate.

Guan Hanqing’s zaju dramas are celebrated for their well-planned, intriguing, and emotion-filled plots. The language is elegantly versed and yet full of the vernacular of his time, which made them easily understood by his audience. His characters are vivid, talking in dialogue appropriate to their respective roles.

Scholars have likened Guan Hanqing’s influence on the theatrical world in China to that of Shakespeare on Western drama. Many of his zaju have been adapted into Beijing Operas as well as Kunqu, a form of opera designated as a World Cultural Heritage masterpiece by the United Nations Educational, Scientific, and Cultural Organization (UNESCO). In 1958 the World Peace Council named Guan
Hanqing among the “famous men of world culture.” His dramas have been translated into many languages.

From Snow in June

In this brief excerpt from Guan Hanqing’s most famous work, Dou E yuan, (also known as The Injustice Done to Tou Ngo, or by its English title Snow in June), the character Tou Ngo responds to the mockery of the prophecies she has foretold.

You say nothing is to be expected of the Lord of Heaven,
That there is no pity for the human heart.
You cannot know the Emperor of Heaven will fulfill people’s wishes.
A drought will come to the country because you officials have no care to see justice done,
And anyone who has a mind to speak is forced to hold his tongue.

Guangdong Province
Guangdong Province is one of China’s most important economic and cultural areas. About the size of Syria, it is China’s most populous and wealthiest province with a gross domestic product (GDP) of 3.07 trillion yuan (US$422 billion). Its location on the southeastern coast of China gives it direct access to the South China Sea, Hong Kong, Macao and Southeast Asia.

The role of Guangdong Province in China is paradoxical. Guangdong has always been a somewhat different and marginal place. Yet this marginal position has been why the province has often played a central role in Chinese history. In recent years Guangdong’s connections with foreign countries and neighboring economies have generated huge economic growth for the province, which became a locomotive for China. Despite these achievements its development remains uneven because the province is culturally diverse and faces tough challenges.

Geographical and Cultural Diversity

The core of Guangdong is formed by the Pearl River Delta, with the capital city Guangzhou at the center. Foshan, Shenzhen, Zhuhai, Zhongshan, Dongguan, and Jiangmen are the other main cities. The delta, populated mostly by Cantonese people, was transformed during the late twentieth and early twenty-first centuries from an agricultural region—producing such commodities as sugarcane, silk, tropical fruits, and fish—into an industrial powerhouse. By comparison, northern and western Guangdong are hilly or mountainous and remain relatively poor. The Chaozhou area, near the Fujian border, is densely populated and fertile, and incorporates the two major urban centers of Chaozhou and Shantou. In addition to Cantonese and Chaozhou people, Guangdong also hosts a large minority of Hakka and a sizable population of fishermen with different traditions and languages and, at times, conflicting relationships with the Cantonese.

“The Mountains Are High and the Emperor is Far Away”

Because of its distance from Beijing, Guangdong was able to develop relatively independent and unorthodox policies and behaviors, a fact echoed by the Chinese proverbial expression “The mountains are high and the emperor is far away.” Since the Han dynasty (206 BCE–220 CE), Guangzhou has been a trading center frequented by Indian and, later, Arabic merchants. During the sixteenth century, the Portuguese settled in Macao, on Guangdong’s southern coast, followed two centuries later by the Americans, British, and other Europeans, who began trading in Guangzhou. Nevertheless, in the sixteenth century, economic growth, not international trade, led to the increased demand for grains and land reclamation. Moreover, at the end of the century, the ban on overseas trade had no effect on Guangdong.

By the eighteenth century, Guangdong’s economy benefited significantly from the confinement of China’s
foreign trade to Guangzhou, under the cohong, or licensed Guangzhou merchants guild system. Again, its distance from Beijing played a role in the imperial decision to restrict foreign trade to Guangzhou.

During the First Opium War (1839–1842), Guangdong was again at the heart of Chinese history. The decision of Lin Zexu (1785–1850), the imperial commissioner in Guangdong, to ban opium and seize stocks held by foreigners was motivated by moral, as well as economic, reasons, as the outflow of silver brought about an economic crisis in China. The Treaty of Nanking (1842), which ended the hostilities, greatly affected Guangdong and the rest of China with the cession of the island of Hong Kong to the British. Guangdong gradually lost its economic preeminence to Shanghai but remained a ground for new ideas and experiments. The Taiping Rebellion (1851–1864),
which originated in Guangxi, did not spare Guangdong. Most important, the province is the birthplace of the Chinese Revolution and of Sun Yat-sen (1866–1924), the “Father of the Revolution.” In 1938 the Japanese occupation of Guangzhou interrupted the economic progress initiated by the warlord Chen Jitang (1890–1954).

**From the Maoist Period to the Open Door Policy**

Guangdong’s difficulties continued during the Maoist era. With its proximity to Hong Kong and Macao, and its strong links with foreign countries because of an old wave of migration that accelerated during the nineteenth century, Guangdong was perceived by Beijing as unreliable. Most of its international trade was cut off for much of this period. National policies emphasizing the development of heavy industry were detrimental to Guangdong, which lacks natural and energy resources. Consequently, it concentrated on rice production while neglecting traditional commercial cultures.

With the reforms of the late 1970s, Guangdong revived its traditional role of experimenter and innovator. Rural reforms stimulated commercial agricultural production and rural industries. The Open Door policy, aimed at attracting foreign direct investment (FDI), revived the traditional links between the province, especially in the Pearl River Delta, and Hong Kong, Macao, and overseas Chinese. Also significant was the creation in 1980 of special economic zones. The zones—Shenzhen, Zhuhai, and Shantou—are in Guangdong. The only exception is Xiamen, in Fujian Province. In 1988 Hainan Island was detached from Guangdong to form another special economic zone. As land prices and wages in Hong Kong soared, thousands of small and medium-sized enterprises in Hong Kong moved across the border, thereby spurring the development of subcontractor industries in Shenzhen, Dongguan, Foshan, and other areas. The Pearl River Delta became the prime region of China for FDI.

The social consequences of this economic reorganization, however, were enormous. For the first time in thirty years, local populations were in contact with the lifestyles of their counterparts in Hong Kong and elsewhere. Many switched from an agricultural way of life to an industrial one. The high demand for unskilled workers stimulated migration from China’s less developed areas, such as Hunan and Jiangxi, which mixed populations with different cultures.
and dialects. The number of migrants in Guangdong has been difficult to assess. Official statistics indicated 13 million people in 2006, which may be a severe underestimation. As a result, Guangdong is China’s richest province, with the highest gross domestic product in the country—3.07 trillion yuan (US$422 billion), the sixth highest per capita gross domestic product 32,713 yuan, and the top exporter ($241 billion) of any province in the country in 2005.

**Future Challenges**

Despite these achievements Guangdong faces major challenges. Production factor costs (e.g., the labor force) have greatly increased over the last thirty years, making technological upgrading necessary despite undeniable progress in that field over the past ten years. The decentralization of the 1980s led to competition between local governments not only for access to technologies or FDI but also for infrastructure. Resources have been wasted in duplicated infrastructure projects, such as airports, and local cooperation remains difficult.

The relationship between Hong Kong and the Pearl River Delta needs to be better defined. Since 1997, the two economies have become more integrated while new projects like the Hong Kong–Zhuhai–Macao Bridge continue. High-level political discussions are constantly held. Political channels of discussions between the Guangdong governments and that of the Hong Kong Special Administrative Region have been established to facilitate the relationship between these two entities. Nevertheless, the question remains as to whether Hong Kong should remain a window into China while the delta keeps its industrial function, or if the delta should assume a more leading position. In relation to this point, the exact role of each of the two metropolises of Hong Kong and Guangzhou will have to be clarified.

After thirty years of double-digit economic growth in China, the last twenty of which have been the most accelerated, it is clear that Guangdong has become proportionally less important for China in comparison to other areas, such as the Yangzi Delta, which has attracted considerable foreign and state investment in recent years. But this evolution questions the future economic situation of the province within the context of national interests and globalization. To address this matter, local leaders are trying to stimulate local demand and investment in order to wean Guangdong off FDI and exports. While this
solution has been successfully implemented by newly industrialized economies, the long-term effects for Guangdong are unclear. Its aging population (about 10 million people are over 60 years old) may jeopardize this strategy and lower the province’s dynamism, not to mention the usual challenges associated with an aging population. A further challenge, and one that may trump the others, is how to curb the high level of pollution created by the explosive economic growth of the last twenty years.

Guangxi Zhuang Autonomous Region

Guǎngxī Zhuàngzú Zìzhìqū
广西壮族自治区

47.68 million est. 2007 pop. 236,300 square km

Guangxi Zhuang Autonomous Region is one of China’s five Autonomous Regions: administrative divisions where certain ethnic groups—in this case the Zhuang—predominate. It is located on China’s southern coast and is famous both in China and around the world for its misty mountain scenery.

The Autonomous Region of Guangxi is located on the southern coast of China. Since 1958 the official name has been the Guangxi Zhuang Autonomous Region, named for the Zhuang nationality, the largest of China’s fifty-five minority ethnic groups; they constitute a third of the region’s population of nearly 48 million (2000 est.). The Zhuang speak a language (in two dialects) that belongs to the Zhuang-Dong/Dai branch of Sino-Tibetan, a relative of Thai.

Guangxi covers an area of 236,300 square kilometers (91,200 square miles, about the size of Romania) and borders on Vietnam and China’s Yunnan Province in the west, on Guizhou and Hunan provinces in the north, on Guangdong Province in the east, and on the Gulf of Tonkin in the south. The region is dominated by mountains with peaks over 2,000 meters above sea level in the far west and the far north. Guangxi Zhuang A.R. is traversed by sixty-nine rivers, most of which are tributaries to the Zhu (Pearl) River.

Guangxi has a subtropical monsoon climate, and the rainy season from April to September accounts for 80 percent of the annual precipitation of 1,250 to 1,750 millimeters. Temperatures in January average between 6° and 15° C, while the July average is between 23° and 28° C. The capital, Nanning (2007 estimated population of 6.83 million) is in the southern central part of Guangxi and is known as the “Green City” because of its array of parks and its subtropical climate. The eastern part of the region became part of the Qin empire (221–206 BCE) in 214 BCE, and after a brief period of independence, was conquered by the Han empire (206 BCE–220 CE) in 112–111 BCE. From the Tang dynasty (618–907 CE) onward, the area has been part of various southern administrative divisions, sometimes divided into a Han Chinese region in the east and a Zhuang region in the west. Throughout the centuries, the region has been marked by rebellions against succeeding imperial governments and by tribal warfare between the Zhuang and other minority nationalities that were pushed south by the Chinese migration from the north. The Taiping Rebellion (1851–1864) originated in Guangxi, and later in the nineteenth century the French colonial power in Indochina extended its activities to the region.

Guangxi is one of China’s most diversified areas with regard to population. Although the Han Chinese today constitute over 60 percent of the population, there are eleven minority nationalities, of which the Zhuang is the largest by far. Several of these minority groups number fewer than 100,000 people. The most important agricultural crops are rice, millet, and sugarcane, but the region grows a wide variety of crops, including tobacco, tea, fruit, soybeans, sweet potatoes, and peanuts. In the mountains in the northwest, forestry dominates, with pine, fir, oak, and camphor trees. Major industries include textiles, chemicals, machine building, and food and tobacco processing. The scenic areas around Guilin
and Yangshuo in the northeast, featuring dramatic karst (limestone) mountains and underground caves, provide a major source of income through tourism. The image of the improbably steep, misty mountains of Guangxi is famous around the world.

Guangzhou (Canton) has been an economic center for centuries. The city, with its liberal economic policies, has played a major role in China’s recent modernization efforts, attracting foreign capital and investment. Guangzhou is home of the Chinese Export Commodities Fair, better known as the “Canton Trade Fair.”

Guangzhou (Canton) is the largest city in southern China and the capital of Guangdong Province, which is the main point of entry to China from Hong Kong. Guangzhou is located on the southeastern coast in the Pearl River delta.

As the economic center of the delta, Guangzhou is one of the nation’s leading manufacturing and commercial areas. The city’s gross domestic product (GDP) was $92 billion in 2007, sixth among Chinese cities. Guangzhou has a long history of economic activity. As far back as the eleventh century, foreign traders settled in Guangzhou to trade spices and ivory for tea and silk. During the nineteenth century Guangzhou was further opened to the West when European nations imposed on China unequal trade treaties that gave traders from Europe access to Chinese markets. In addition to Guangzhou’s importance as a trading center, the city played a major role in the First Opium War (1839–1842), the Republican Revolution of 1911, and current political and economic reforms in China.

Guangzhou gained notoriety for another reason after the founding of the People’s Republic of China in 1949. Residents of the city who had relatives living abroad were either punished or reeducated. Guangzhou residents were next attacked for their overseas family connections during the Cultural Revolution (1966–1976), this time by Red Guards. Residents who had relatives overseas were either harassed or persecuted for their contact with lifestyles deemed decadent. Guangzhou still has China’s largest population of people with relatives living abroad.

Guangzhou’s industry includes computers, petrochemicals, machinery, shipbuilding, sugar refining, textiles, household electrical appliances, light industrial products for daily use, rubber products, and garments. Local crops include rice, sugarcane, and fruit. Mineral resources include zinc, lead, limestone, coal, salt, copper, and iron.
Guangzhou, empowered by its liberal economic policies, has played a central role in the country’s recent modernization efforts, attracting foreign investment and capital. Western companies wanting to enter the Chinese market have established shops, factories, and hotels. But despite such investment, overseas Chinese investors account for most of the foreign capital.

Guangzhou is home of the Chinese Export Commodities Fair, which is more commonly known as the Canton Trade Fair. The fair, established in 1957, is held every April and October. The relevance of the fair has been in question, however, since China’s admittance to the World Trade Organization (WTO) in 2001 and the nation’s continuing economic reforms. In the past the fair offered the only place where representatives of Chinese state-owned enterprises and foreign companies could negotiate deals. But with the opening of China’s massive economy, the fair faces increasing competition from other provincial and municipal governments intent on hosting large-scale business and trade conventions.

The concept of guanxi in China is based on people having common experiences or connections—being a classmate or a co-worker, coming from the same area, having mutual friends—through which they can network. As a tool for contact and communication, guanxi holds great value in Chinese society. Because guanxi often involves an exchange of favors it can occasionally result in corruption.

The concept of guanxi, or “social relationships,” is important in everyday Chinese life. Both individual and group interests are asserted via such relationships. There is a particular image of society behind this concept. Many Chinese see society in the first instance as a hierarchically structured order covered by an interlaced network of relationships. While a person’s outward appearance and behavior may be important for many Europeans, who one knows and to which group or work unit one belongs are of consequence for many Chinese.

Not all interpersonal relations are based on guanxi. Relations between members of an immediate family or between spouses are based on other obligations (for example, obedience or respect). Guanxi relations arise when people have certain things in common, such as coming from the same area, mutual experiences or friends, or other social connections, and they are developed first of all with people with whom one is in direct contact.

Tong Relationships

Tong, or having something in common, is the most important basis for guanxi. The tongban (classmate), tongbao (person from the same region), tonghang (person in the same business), tongshi (colleague), tongxian (person from the same hometown or village), and tongxue (person who studied at the same school) all have special relations with one another (tong relationships). Relations can also be forged through gifts, personal favors, or mediation by third parties. They include mutual obligations and expectations. For every action, something is expected in return. Guanxi is less a private relationship than a role-playing game that, on the basis of previous or current situations, produces expectations. Those who do favors gain “face” and are recognized by others as people who have respect for those around them.

Friendship and tong relationships involve certain obligations, such as constant readiness to help and support not only the person directly involved in the relationship but also his or her family and friends. Refusing to give this help and support was and is seen as negative social behavior, as a complete lack of any kind of human feeling, or alternatively as proof that someone does not love those to whom he or she is naturally linked and therefore obliged to help. In these cases, refusing to help is seen as the highest form of inhumanity and a break with morality.
**Guanxi as Connection**

To make use of guanxi, both sides have to be able to give each other something (influence, protection, access to scarce goods and services, opportunities for promotion or profit). If no connection exists with an influential person, a link is “created” (la guanxi). To do this, a person from the same guanxi network is sought who can, via various channels, set up the connection. For example: A requires something from D. However, there is no guanxi between them. In A’s relationship network, there is B, who is connected with C. And C has guanxi with D. A therefore asks B to get in touch with C. B helps A and turns to C; C wants to help B and speaks with D. D wants to do C a favor and therefore helps A. Through this sort chain, new guanxi connections develop and with them new mutual obligations. In this way, guanxi fulfills the function of a social investment and can be seen as a relationship between people or institutions based on exchange and with a mutual understanding of the rights and obligations of both parties.

**Guanxi versus Corruption**

Although there are distinct similarities between guanxi and corruption, the two phenomena are not identical, because the social and ethical concepts behind them are (at least theoretically) different. Unlike corruption, guanxi is based on real or imagined things in common and is therefore a question of personal emotions. This means that one looks after the individual in question personally and is prepared to help him or her. These feelings can be maintained and extended through favors and gifts. Presents of this kind can be found in the traditions of many peoples, and it becomes corruption only within the framework of a rational state form.

**Guanxi as Network**

There are different degrees of intensity of guanxi depending on the degree of emotion involved. The bigger the emotional aspect, the closer the relationship. Guanxi relationships based on experiences in common plus emotional connections are therefore stronger than those that came about merely via mediation by a third party. The stronger a relationship, the more social, political, and economic use can be made of it, the more social capital it has.

Guanxi relationships have always played an important role in Chinese history. In premodern China, there was a life-long bond, including mutual political loyalty, between officials who had passed the same top-level exam. At the same time, they were politically loyal to the higher-rank officials who had examined them. This was an important basis for the emergence of “old-boy networks,” which today still exist in the form of loyalty to those who studied at the same university or to former political leaders. People from the same village or from the same province clubbed together in areas far from their local region to form regional groups, the members of which are obligated to assist one another. This practice continues today.

In the People’s Republic, a system of personal dependencies on superiors developed, because superiors were responsible for hiring, promotion, rewards, punishment, or evaluation of political attitude and therefore could determine the whole life and career of their subordinates. This was encouraged by the fact that the danwei (work unit) was responsible not only for one’s work life but also for political, economical, and social affairs. In this way, an authoritarian culture with relationships based on personal loyalty and “old-boy networks” was encouraged. Guanxi relationships are particularly important in this context because before the reforms there were many shortages of goods and services that the state in its monopolist position oversaw, and officials enjoyed privileges that allowed them to use guanxi to obtain everything that was not available legitimately or available only in limited quantities. Friendship and acquaintance with official cadres still help ease some material problems, and political careers and promotions depend on connections with leading functionaries.

Today guanxi still runs through the entire social framework: from employment (retaining or changing jobs) to finance and economics (granting business licenses, loans, tax rates) and everyday life (distribution of housing, access to good medical care), to name only a few examples. Just about everybody has to use guanxi to ensure trouble-free living and working. The reform era
has even led to a significant expansion of guanxi relationships. The strong orientation toward a market economy, combined with the simultaneous retention of the party’s monopoly on power, has led to more fostering and development of guanxi in the form of an explosion of present giving and hospitality, which has meant significantly higher expenditures for individuals and institutions.

**Guanxi as a Specifically Chinese Institution**

The main reason for guanxi is social uncertainty, particularly when other security structures such as the clan or the village community are no longer able to provide social protection. Those affected try to obtain personal protection through guanxi, particularly when in positions of political and legal uncertainty. In addition, studies have shown that the Chinese (because of their political and social experiences) are a lot more suspicious of other people and of their environment than, for example, Americans are. The conclusion from this is that suspicion and uncertainty make people seek security and trust not in the political sphere but in the private sphere and in guanxi relationships—an important factor in the creation of factions and “old boy networks.”

Guanxi is an important instrument for contact and communication between social groups and communities (villages, clubs, associations, professional groups) and also between individuals and the state or party, particularly since it eases reciprocal bargaining processes and can lead to decisions that otherwise would not be taken or would be only partially reached. Where there are no formal avenues for participation and the mechanisms for institutional pressure are weak, guanxi becomes a means to influence politics and political decisions and serves to link the state (party) with society. However, because individuals and groups use guanxi to seek influence, power, or advantages and in doing so disregard state, ethical, moral, social, or political standards, actively breaking with norms when it is advantageous to those involved, this behavior encourages and occasionally overlaps with corruption.

Guanxi is neither a “typically Confucian” nor a “typically socialist” concept. It should instead be interpreted as a principle on which society is organized that is explicable in both cultural and political terms and that functions in the People’s Republic of China as well as in Taiwan and among Chinese living abroad.

Guanyin

Guānyīn 关音

Guanyin 觀音, or Guanshiyin 觀世音, is one of the most popular deities worshipped among Chinese Buddhists. During the process of domestication, this Indian male deity was transformed into a female divine savior, characterized by great mercy and compassion (daci dabei 大慈大悲); she is known for her ability to bestow miracles on her devotees.

Guanyin (or Guanshiyin) is the Chinese name for Avalokiteśvara, a male celestial bodhisattva (deity) in Indian Buddhism. Literally guan means “to perceive” or “to look on,” and [shi]yin refers to the “[world’s] sounds” of prayers. In China Guanyin is known as a goddess characterized by great mercy and compassion; she is efficacious in response to anyone who sincerely prays to her or calls out her name for help.

Two Mahayana Buddhist scriptures are particularly responsible for popularizing Guanyin worship in China. One is the twenty-fifth chapter of the Lotus Scripture (Saddharmapundarikâ-sûtra; Chinese: Miaofa lianhua jing), especially the version translated by Kumārajīva (344–413?) in 406 CE. Guanyin is said to be a compassionate deity who assumes various forms in the world to save people from suffering. This chapter, entitled “Universal Gate” (pumen), later became an independent text known as the Guanyin Scripture. The other scripture is the Longer Pure Land Scripture (Sukhâvatîvyûha-sûtra; Chinese: Wuliangshou jing), translated into Chinese around the third century CE. Guanyin here is the chief assistant to Amitâbha Buddha, the Buddha worshipped in Pure Land Buddhism. With the wide appeal of the Lotus Scripture and the popularity of Pure Land Buddhism, Guanyin worship has developed into one of the most prominent religious practices in Chinese Buddhism.

In the beginning Guanyin as shown in paintings or sculpture was either masculine or asexual. Gradually, however, this Indian male deity was transformed into a distinctively Chinese goddess. One theory among modern scholars to explain the sexual transformation of Guanyin is that Târâ, the white-robed goddess of mercy in Tibetan Tantric Buddhism, may have influenced the Chinese projection of a female Guanyin. The most recent theory, however, suggests that the feminization of Guanyin should be seen as a result of the sinicization of Indian Buddhism by incorporating various images and myths of goddesses in Chinese Daoism and folk religions. Whatever the case may be, representations of Guanyin clearly have become predominately feminine since the tenth century.

Apocryphal scriptures and miracle tales about Guanyin started to circulate during the fifth century and continue to be widely read by Buddhists today. As Guanyin’s popularity increased, she was also associated with many indigenous local legends. By far the best-known legend is that of Princess Miaoshan in Honan, which began to be told as the life story of Guanyin around the eleventh century. Miaoshan, a king’s third daughter, was a devout Buddhist who refused to marry. After her angry father killed her, she miraculously revived
and returned to Earth to cure her father’s illness by sacrificing her eyes and hands. She later manifested herself before her parents as a divine being with a thousand arms and a thousand eyes.

Guanyin is believed to embody the power to bring women sons, save fishermen from calamities at sea, cure the sick, and protect the faithful from harm on a daily basis. As a beloved goddess of great mercy, she has many images; aside from the White-robed Guanyin (baiyi Guanyin) and Son-granting Guanyin (Songzi Guanyin), there are the Water-moon Guanyin (Shuiyue Guanyin), Fish-basket Guanyin (Yülan Guanyin), and Guanyin of the South Sea (Nanhai Guanyin) residing on Mount Potalaka. To this day devotion to Guanyin is flourishing not only among east Asian Buddhists but also throughout the Buddhist world.

Guilin

Situated in northeastern Guangxi Zhuang Autonomous Region on the southern coast of China, Guilin administers five city districts (the city proper is 565 square kilometers), ten counties, and two autonomous counties for a total area of 27,809 square kilometers. Guilin has a subtropical monsoon climate with an annual average precipitation of 1,949 millimeters. Its annual average temperature is 18.9° C; the hottest month, August, has an average temperature of 23° C, and the coldest month, January, 15.6° C.

Guilin was founded around 111 B.C.E and obtained its current name in 1372 C.E. The word guilin (forest of Sweet Osmanthus) is a reference to the Sweet Osmanthus shrubs that crowd the city’s landscape. Traversed by the Li River, Guilin has a typical karst (an irregular limestone region with sinkholes, underground streams, and caverns) topography. Qixingyan (Seven Star Cave), located on the eastern bank of the Li River, is eminent among the karst caves of Guilin. Consisting of three layers of caves on the upper, middle, and lower levels with an underground river, Qixingyan culminates into a labyrinth of stalactites, stalagmites, and stone pillars illuminated by colorful lights. Ludiyan (Reed Flute Cave) is an underground karst cave that descends to 240 meters. White natural stalactites of different shapes form a myriad of “scenes.” Some resemble lions, pine trees, or mushrooms, and others suggest a dreamy crystal palace or mountain of clouds.

Guilin’s scenery has inspired generations of literati, giving the city the reputation that Guilin Shanshui jia tianxia (Guilin waters and mountains rank first class around the world). Commercial tourism in China was nonexistent until the 1980s. According to the National Tourism Administration, the earliest recorded numbers of visitors for domestic tourism were 240 million arrivals, with a total revenue of 8 billion yuan in 1985. The earliest recorded numbers of visitors for international tourism were 1.8 million arrivals with receipts of USD$0.26 billion.
in 1978. International hotels have grown from 431 in 1978 to 4,418 in 1996, and international tourists increased from 1.8 million in 1978 to 51.1 million in 1996. Domestic visitors increased from 2.4 million arrivals in 1985 to 640 million in 1996, and the revenue they generate increased from 8 billion yuan in 1985 to 164 billion yuan in 1996.

Scenic sites around Guilin extend from the Lingqu Canal in Xing’an in the north to the town of Yangshuo in the south. Most representative of Guilin scenery are the Li River, Qixingyan and Ludiyan caves, and Duxiufeng, Fuboshan, and Diecaishan hills. The Li River reflects the picturesque hills with bamboo fronds and passes a procession of peaks and waterfalls. Fishermen on bamboo rafts fish with trained cormorants.

Xiangbishan (Elephant Trunk Hill) is so named because of its resemblance to an elephant dipping its trunk in the water to drink from the western bank of the Li River. Duxiufeng (Solitary Beauty Hill) features a stairway of 306 stone steps leading to the top. Cliffs on the hill are engraved with poems of artistic and historical value written by literati throughout the dynasties. Diecaishan (Folded Brocade Hill) is lush with vegetation and honeycombed by caves decorated with calligraphy and Buddhist statuary. Fuboshan (Wave Subduing Hill), not far to the east of Duxiufeng, is also punctuated with caves.

These sites represent only a sample of the Guilin panorama. Standing out among scenic natural beauties are shanqing (verdant mountains), shuixiu (limpid waters), dongqi (peculiar caves), and shimei (beautiful rocks).

**Further Reading**

A fisherman on the Li River in Guilin. A traditional mode of fishing in China involves the use of cormorants to catch fish. Fishermen on bamboo rafts use strong lights suspended over the water to attract the fish. The cormorants, which are tethered with rings round the base of their necks, catch the fish and then disgorge them for the fishermen (When their work is done the rings are removed so they can eat). The boats are flat, narrow rafts consisting of five or six large, round bamboo trunks tied together and upturned at the stern. The fisherman stands on the raft, using a pole to propel the boat. His cormorants perch on his outstretched arms, diving on his command. One good cormorant can feed an entire family. PHOTO BY PAUL AND BERNICE NOLL.

Guizhou Province
Guizhōu Shěng 贵州省
37.62 million est. 2007 pop. 176,100 square km

Guizhou is a province about the size of Uruguay in the southwestern part of the country. It is surrounded by the provinces of Sichuan (to the north), Hunan (to the east), and Yunnan (to the west), as well as Guangxi Zhuang Autonomous Region (to the south). Guizhou is a relatively undeveloped and poor province.

A traditional saying sums up conditions in Guizhou, a relatively undeveloped province in southwestern China: “Not three days of weather the same, not three mu [about half an acre] of flat land, not three fen [about half a U.S. cent] in the pocket.”

Here some 38 million people are crowded into 176,100 square kilometers (68,000 square miles, about the size of Uruguay), of which only 4,900 square kilometers (1,982 square miles) are under cultivation. Much land is habitable only at low densities or not at all. About 75 percent of the land is hills and mountains, mostly limestone. About 3 percent is bare rock. So limited is agricultural land that each acre must support twenty farm people. Each acre, even on slopes, must be cropped, on average, 1.8 times a year. Population pressure results in 40 percent of the total land being seriously eroded.

About 63 percent of Guizhou’s workers are employed in the primary sector, mainly in coal mining and agriculture. Coal mining is important with an annual production of about 100 million tons. The main crops are summer rice, maize, winter wheat, and rapeseed (canola). Other crops include potatoes, a major subsistence crop at high elevations, and apples. Overall, the primary sector accounts for only 22 percent of production.

Secondary industries produce 43 percent of the wealth from just under 10 percent of the workers. These are concentrated mainly around the provincial capital, Guiyang, a city of a little over a million people (the associated administrative region has a population of 3.2 million). Industrial plants are also located in smaller towns, such as the large steel works at Anshun in the west, built at the height of the Cold War.

Provincial gross domestic product per person is amongst the lowest in China. Poverty is widespread, compounded by relatively high levels of dependency and, for China, high birthrates. Some 27 percent of the population is not ethnic Han and thus not subject to the one-child policy. In addition, most Han in the province are rural and are thus allowed two children. Life expectancy at birth averages five years less than the seventy-three years that is the norm for China as a whole (2008 estimate).

Although Guizhou was considered part of the Chinese empire by the Han dynasty (206 BCE–220 CE), the ethnic Han population, even in the sixteenth century, probably did not exceed a few hundred thousand. The provincial administration began in the seventeenth century under the Ming dynasty (1368–1644) although the native Miao peoples were not brought fully under government control until 1870, under the Qing (1644–1912).

While the province is rich in coal and limestone resources, it will take very large investments to exploit them fully. Although annual rainfall ranges from 800 to 1,500 millimeters (31 to 59 inches), surface water is scarce. Limestone landscapes and China’s largest waterfall,
Huangguoshu, attract tourists mainly from within China, but infrastructure in the province is weak. Levels of literacy are low, with 12 percent of men and 28 percent of women being unable to read or write simple Chinese.

The central government tends to obtain better returns from development expenditure in the coastal provinces, so growth in Guizhou is likely to remain relatively slow in the near future, especially as the province’s transportation infrastructure lags behind that of the rest of the country.

Gunpowder and Rocketry
Huǒyào hé huǒjiàn 火药和火箭

Gunpowder is one of history’s most important discoveries. Scholars believe gunpowder originated in China by the late Song dynasty (960–1279). While the early history of rocketry is not certain, the earliest known clear reference to a rocket dates to 1264.

Gunpowder and rocketry have related, although unclear histories. Scholars believe that both had originated in China by the late Song dynasty (960–1279). Gunpowder was the first propellant and explosive and one of history’s most important discoveries. It has three ingredients: potassium nitrate (also called “salt peter”), sulfur, and charcoal. Gunpowder, also called “black powder,” propelled the first gun projectiles and rockets. Rockets used a low-nitrate, slower-burning gunpowder and were self-propelled after the powder ignited.

Discovered, Not Invented
Most likely gunpowder and the rocket came about as surprise discoveries rather than as inventions. Chinese Daoist philosophers for centuries experimented with chemicals to seek a way to longevity. One Daoist book, Zhen yuan miao Dao yao lue (Classified Essentials of the Mysterious Tao) from about 850 CE warned not to mix certain ingredients, including salt peter and sulfur, because the mixture had been known to flame up, singe beards, and burn a house. These are examples of several known Daoist alchemical explosions, and evidently the Chinese at the time apparently did not understand the nature of combustion. They still believed, as late as the seventeenth century, for example, that the combustion of gunpowder was caused by the interaction of the yin (female element) and the yang (male element).

The earliest recognizable gunpowder formulas appeared in Wu jing zong yao (Essentials of Military Classics), edited in 1044 by Zeng Guangliang. The first real gun appeared about 1260. Scholars have many theories about how the rocket appeared. One theory is that the discovery occurred accidentally when a Chinese soldier modified an ordinary slow-burning “fire arrow” that suddenly flew on its own before it was shot from the bow.

Chinese chronicles contain numerous accounts of gunpowder weapons beginning during the late Song dynasty, although it is often unclear whether the accounts refer to rockets. The most famous examples of such weapons are the flying fire arrows—or, more likely, flying fire spears—used in 1232 by the Chinese against the Mongols in the siege of Kaifeng. Some scholars contend that the weapons were no more than thrown flying fire spears containing or emitting incendiary compositions or perhaps handheld lances that merely shot fire into the air; other scholars contend that the weapons were true self-propelled rockets.

The term huo chien (fire arrow) at first meant simply an incendiary arrow but later came to mean a rocket. The earliest depictions of Chinese rockets, in the Wu bei zhi (Treatise on Armament Technology, c. 1628) of Mao
Yuanyi show many variations of arrows with rocket tubes attached and therefore were real rocket arrows. These examples may be strongest evidence that Chinese rockets did evolve from ordinary incendiary arrows.

The clearest early Chinese reference to a rocket involves fireworks. According to Qi dong ye yu (Rustic Talks in Eastern Qi, c. 1290) by Zhou Mi, a fireworks display was held in 1264 in the courtyard of the royal palace. One firework, called a “ground rat,” shot up the steps of the throne of the empress mother and frightened her. Thus, it was self-propelled, that is, a rocket.

However the rocket came to be, it had spread to Arabia by the late 1200s and apparently from there into Europe, probably first to northern Italy, via maritime trade routes. The first guns appeared in Europe by the fourteenth century. The spread of gunpowder and rocketry throughout the rest of Asia is less well documented. The earliest known rockets in Korea appeared in 1377, possibly introduced directly from China.

Southeast Asia and India

One possible way by which to trace the spread of rocketry in Asia is by tracing the origins of allegedly centuries-old rocket festivals in Southeast Asia. Northeast Thailand holds the annual Boun Bang Fai (also spelled Bunbang-fei) festival during which large, decorated gunpowder rockets with bamboo guide sticks are fired by different villages to please the rain gods and to ensure a bountiful rice harvest. Neighboring Laos celebrates the identical animistic (relating to a doctrine that the vital principle of organic development is immaterial spirit) and Buddhist festival. A similar practice is found in the remote...
Xishuangbanna Dai Autonomous District in Yunnan Prefecture of China, adjacent to northeast Thailand and Laos. Myanmar (Burma) stages the Pa-O Rocket Festival of the Pa-O minority group in the Shan states.

There is a definite link between the festivals in Thailand, Laos, Yunnan in China, and Myanmar, whose practitioners of the festivals are all of the same Tai or Dai cultural stock. However, we do not know the actual histories of the festivals, but one theory is that basic gunpowder and rocket technology began in China in the eastern, more advanced area of the country, probably in the Song dynasty capital of Hangzhou. From this area, knowledge of gunpowder and rocketry probably first spread via Chinese maritime trade missions to India in the early fifteenth century.

In India, gunpowder, fireworks, and especially the rocket, became well developed. War rockets were used in India for centuries. From India, the technology may have then spread to neighboring Burma (now Myanmar) and from there to Siam (now Thailand), Laos, and back to China, to the more rural agricultural area of Yunnan.

GUO Moruo ▶
Guo Moruo was a literary figure and cultural leader who is well known as an authority on Chinese ancient history and for his service to the cause of Communist power. Both his acclaimed written works and his public involvement in government and cultural activities led to his reputation as a cultural leader during his time.

Guo Moruo was born in the town of Shawan in Sichuan Province to a merchant-landlord family and named “Kaizhen” by his parents. His family had business in oil of various kinds, money exchanging, and the opium trade, and was affluent enough to have a family school, where Guo began his formal education in the Confucian classics at age five. He was inspired by the study of world history and eager to leave his small town. While still a high school student in Chengdu, Guo married Zhang Qionghua (1890–1980), an illiterate bride betrothed to him by his parents. Not happy with this arranged marriage, Guo left home soon and enrolled briefly at the Military Medical School in Tianjin, but left without earning a degree. In 1914 he went to Japan and attended the Sixth Higher School, which prepared him to attend Kyushu Imperial University, where he would graduate with a bachelor’s degree in medical science in 1923.

While at the Sixth Higher School, Guo met Satō Tomiko (1895–1994), whom he called “Anna” and who would make a lasting impact on Guo’s personal life as well as his career. Their life together as a common-law couple inspired Guo to write romantic poetry. From the time they appeared in Shishi Xinbao (Current Affairs Newspaper) in Shanghai, Guo’s poems became immensely popular among Chinese youth and earned him a distinctive position in the new literature of the anti-imperialist May Fourth era. In publishing these poems Guo first used the name “Moruo,” after the two rivers flowing by his hometown. Through his literary activities Guo met several like-minded people, including Yu Dafu, Cheng Fangwu, and Tian Han; together they organized the Creation Society in 1922, published Creation Weekly (Chuangzao zhoukan), and regularly contributed to the literary supplement of New Daily of China (Zhonghua xinbao) in Shanghai. While wavering between a literary and a medical career, Guo turned to autobiographical fiction as he recorded the difficulties of earning a living as a writer in Shanghai to support his growing family, now with four children, and the racial discrimination he confronted as a Chinese in Japan.

Guo’s career took a political turn around 1924 under the inspiration of the Marxist writing of Kawakami Hajime. Returning to Shanghai, Guo found himself in the whirlpool of the May Thirtieth Movement, which began when Shanghai police opened fire on anti-imperialist strikers, and gave public speeches at mass rallies. He soon made connections with the Communists and joined the Northern Expedition to head the Department of Propaganda. He had to flee from China to Japan when the Guomindang (Chinese Nationalist Party) turned against the Communists.

Research Acclaimed

Between 1928 and 1937 Guo lived in Japan and turned his energy to historical studies, especially the study of...
oracle bone and bronze inscriptions and the ancient history of China. He participated in the 1928 debate on the structure of Chinese society and applied Marxist theory to his arguments. His book, *Researches on Ancient Chinese Society* (*Zhongguo Gudai Shehui Yanjiu*), was published in Shanghai in 1930 and became an instant success. Both of his works on ancient history and oracle bone inscriptions were acclaimed in China and Japan in the 1930s and established him as an authority on ancient Chinese history.

In 1937, soon after the outbreak of the War of Resistance against Japan, Guo eluded the gendarme surveillance in Japan and returned to China, leaving Anna and their five children behind. He wrote articles for resistance war propaganda and presided over the *Salvation Daily* (*Jiawang Ribao*) in Shanghai in 1937. In the remaining years of the war he lived in Chongqing, China’s war capital, and headed the Cultural Activity Committee of the government. After the second United Front of the Guomindang and the Communists deteriorated, Guo sided firmly with the Communists and wrote historical plays to criticize the government’s policy. One of his major accomplishments was *Qu Yuan*, a historical drama masking his criticism of the ruling Guomindang, staged to acclaim in Chongqing in 1942. On the three hundred-year anniversary of the fall of the Ming dynasty (1368–1644) in 1944, Guo published (in the *New China Daily*) *In Commemoration of the 300th Anniversary of the Jiashen Year (1644)* (*Jiashen sanbianian ji*), another masked criticism of the Guomindang through a historical analysis of the internal conflict that caused downfall of the Ming dynasty. His works during the war infuriated the ruling Guomindang but were acclaimed by the Chinese Communist Party. In 1939 Guo married Yu Liqun (1916–1979) in a ceremony presided over by the Communist leader Zhou Enlai. The couple had five children in the next decade and half.

### Cultural Representative

After the founding of the People’s Republic of China in 1949 Guo took several important positions in the government as a leader in cultural circles. He became one of the thirteen vice directors, along with Song Qingling, Lin Boqu, and Li Jishen, of the Standing Committee of the First National People’s Congress and one of the sixteen vice chairs of the Political Consultant Council in 1954. In the same year Guo was one of the leading intellectuals designated by the government to organize the Chinese Academy of Science and later was appointed president of the academy, the highest research institution in China. Abroad Guo was arguably the cultural representative for the new China. Throughout the 1950s he led several Chinese delegations to the World Conference to Defend Peace, held in Moscow and Stockholm. In 1955, in absence of diplomatic relations between China and Japan, Guo led a ten-person Chinese science delegation for a month-long visit to Japan. During the Cultural Revolution (1966–1976) Guo continued his official functions as cultural leader and was placed under protection by order of Zhou Enlai, but lost one son to the abuse of the Red Guards and another to suicide. Guo survived the Cultural Revolution and died at age eighty-seven in 1977.

Guo left a legacy of romantic poetry that represented a youthful yearning for freedom during the May Fourth era, a deep engagement and paradoxical relationship with Japan and Japanese culture, and a record of using his literary talent and scholarly knowledge in the service of Communist power.

Guohua (National-Style Painting)

The term guohua or “national-style painting,” first gained prominence in the early twentieth century as part of a broader discussion about how to define “Chineseness.” Although originally used to distinguish Chinese painting from Western art (xihua), the term guohua is now used primarily to distinguish between traditional art and modern art.

The term guohua, or “national-style painting,” refers very broadly to artworks that employ the materials (ink, mineral pigment, paper, silk) and stylistic models established as far back as the Tang (618–907 CE) and Song (960–1279) dynasties. Sometimes referred to as Zhongguo hua (“Chinese painting”), such works are frequently contrasted with xihua, or “Western-style painting,” though in most instances such sharp dichotomies are somewhat artificial.

After the fall of the Qing dynasty (1644–1912) and the founding of Republican China the country entered a period of rapid social transformation that was accompanied by unprecedented exposure to foreign ideas on virtually every front—political, industrial, economic, and cultural. Partly as a reaction to these circumstances and in the process of defining the new nation, questions of national identity arose. During these years guoyu (“national language”) first came to be defined and the Beijing Opera started to be known as guojju (“national theater”); also at this time, the guoxue (“national study”) movement, which focused on Chinese history and classical literature, was initiated by the scholar Liang Qichao (1873–1929). The concept of guohua, emerging from this milieu, was thus part of a larger consideration of Chineseness.

While many early proponents of guohua were concerned with transmitting traditional Chinese artistic values, they were also interested in experimenting with some of the more modern (Western) visual techniques.
and ideas to which they were now being exposed. The issue, in other words, was not simply one of preserving tradition but of finding ways to “imbue new pictorial configurations with historical authenticity” (Wong 2006, xxiv). Particularly influential in this enterprise was a group of artists from Guangdong Province who promoted a “new national-style painting” (xin guohua), by which they meant artworks that combined Chinese themes and Western techniques. Known as the Lingnan (“south of the ranges”) school, this group’s founders had studied in Japan, where they were much influenced by nihonga, or “Japanese-style painting,” a Meiji movement that similarly championed a fusion of East and West.

Following the creation of the People’s Republic in 1949, traditional Chinese-style painting increasingly shared the stage with proletarian prints as the sanctioned art of the state. As culture became ever more politicized, guohua artists were faced with the new challenge of how to apply to painting Communist leader Mao Zedong’s famous dictum that the past should serve the present. One solution was the creation of a hybrid art that fused revolutionary values and history with traditional painting styles. Sunrise in Yan’an after Snow by Qian Songyan (1899–1985), for example, shows a towering pagoda, emblematic of the past, off in the distance, while a modern highway bridge with trucks and buses spans the misty gorge at the heart of the composition. “The whole is illuminated by the rosy glow of dawn, or perhaps to those who wished to read it so, of Communism” (Andrews and Shen 1998, 234).

The situation for painters (and other visual artists) in China has changed dramatically since the late 1980s, especially for certain postmodern practitioners who have been avidly embraced by the international art market. Traditional Chinese-style painting, guohua, continues to be produced and continues to be popular, especially domestically, but the issues of identity that informed its early history now seem to be located elsewhere. In the face of globalization, the question of guohua versus xihua no longer seems to be the pressing issue that it was a century ago.

Hai Rui

Hải Rủi 海瑞

1514–1587 Ming dynasty official

Hai Rui 海瑞 (1514–1587) was a scholar and bureaucrat who served in the late Ming Dynasty (1368–1644). He was known for his stern ethical positions and his unswerving rectitude, remaining an icon of political incorruptibility for the rest of Chinese history.

Hai Rui was a civil official of the late Ming dynasty (1368–1644), famous for his uncompromising moral stance and his Spartan lifestyle. In an era when civil servants commonly enriched themselves through their official positions, Hai was hailed as a paragon of the idealistic Confucian values of incorruptible service to the people and the state. According to his official biography, he was so frugal that his purchase of some pork for his mother’s birthday was treated as sensational news. A minor figure in Ming history, Hai Rui remained a model of public-minded virtue for the rest of Chinese history.

Hai Rui never passed the highest level of the civil service examinations, and it was rare for a scholar to rise in the bureaucracy without doing so. His promotions were based largely on his moral reputation. After serving as a schoolteacher, he was appointed to a magistrate’s position in Shun’an County in Zhejiang Province, an important crossroads for commercial activity. As such, the region was prone to exploitation of the local populace by local officials and by high-ranking travelers who expected luxurious treatment. Hai earned a reputation for challenging and shaming prominent figures who sought special treatment in his jurisdiction.

Hai was soon promoted to a minor post in the Ministry of Revenue at the capital. In 1565, Hai got into trouble for writing a scathing admonition to the emperor, attacking his personal morals, accusing him of misrule, and urging him to reform his ways. For Hai’s lese-majeste (crime committed against a sovereign power) he was imprisoned and only narrowly escaped execution. After his release Hai Rui continued to be appointed to prominent positions in the bureaucracy, although he was given mostly sinecure positions that limited the reach of his stern moralism.

In 1569, after begging the emperor to give him a more substantial position, Hai was assigned to the post of governor of the Southern Metropolitan District, the prosperous region around Suzhou and Nanjing. Again he quickly lived up to his reputation, imposing a stern regimen of austerity and moral rectitude on his new jurisdiction. Official business was conducted with great frugality, and the manufacture of luxury goods was forbidden. In his zealous efforts to fight the exploitation of commoners, Hai launched campaigns against exploitive practices by wealthy landlords, many of whom had ties to the most prominent political families in the empire.

The memory of Hai Rui resurfaced in the late 1950s when Wu Han (1909–1969), a prominent historian and deputy mayor of Beijing, wrote the play The Dismissal of Hai Rui, which was performed in 1961 in Beijing. Hai Rui was portrayed as a moral official willing to speak truth to
Hai Rui Scolds the Emperor

In his 1959 essay “Hai Rui Scolds the Emperor” the historian Wu Han quoted the 1566 petition that Hai Rui wrote to the Jiajing emperor which harshly criticized the emperor’s governance and proposed drastic reform:

How would you compare yourself with Emperor Wen Di of the Han dynasty? You did a fairly good job in your early years, but what has happened to you now? For nearly twenty years you have not appeared in the imperial court, and you have appointed many fools to the government. By refusing to see your own sons, you are mean to your own blood; by suspecting court officials, you are mean to your subordinates; and by living in the Western Park refusing to come home, you are mean to your wife. Now the country is filled with corrupt officials and weak generals; peasants begin to revolt everywhere. Although such things happened when you were enthroned, they were not as serious as they are today. Now Yan Gao has resigned [as Grand Minister], but there is still no sign of social reform. In my judgment you are much inferior to Emperor Wen Di…

The dynasty’s officials know that the people have been dissatisfied with you for some time. By engaging in occultism and searching for immortality, you have confused yourself. Your shortcomings are numerous: rudeness, short-temperedness, self-righteousness, and deafness to honest criticism. But worst of all is your search for immortality… You should realize the impossibility of achieving immortality and repent past mistakes. You should attend the imperial court regularly and discuss national affairs with your court officials. This is the only way to redeem yourself. By doing so you may still be able to make yourself useful to the country during your remaining years.

The most urgent problems today are the absurdity of imperial policies and the lack of clarity of official responsibilities. If you do not tackle these problems now, nothing will be accomplished.

Peter B. DITMANSON

a power hierarchy that was out of touch with the common people, a clear and harsh allegorical indictment of the upper echelons of the Communist Party. Official criticism of Wu and his play began in 1965, and his scholarly circle was purged and imprisoned the next year in the opening salvo of the Cultural Revolution (1966–1976).
Haier

Hǎi’ěr 海尔

Major home appliance company

As the leading home appliance company in China, Haier has become a common household brand name. The incredible business turnaround and advanced management strategies of the Haier company are often used as case studies and examples in major business magazines and business schools. Haier continues to grow stronger in today’s increasingly competitive world market.

Haier is China’s major home appliance company, located in Qingdao, Shandong Province. The company has more than 240 subsidiary companies, not including design centers, manufacturing bases, and trading companies in more than thirty countries. More than fifty thousand Haier employees work in the areas of science and technology, the home appliance industry, foreign trade, and finance. In 2006 the global revenue of Haier was about $15 billion, and the brand name “Haier” was estimated to be worth more than $11 billion.

In 1985 Haier was a desperate refrigerator factory with a huge debt and more than eight hundred employees waiting for their pay. Now Haier is one of the top four home appliance manufacturers in the world, and the brand name “Haier” is a household word and referred to as a miracle example by Fortune, Finance Times, and the Wall Street Journal.

This business miracle was not accidental. When industry focus was on quantity instead of quality twenty years ago, Haier CEO Zhang Ruimin smashed seventy-six defective refrigerators with a hammer in front of the factory’s workers to show a new focus and an iron-strong determination: Quality was going to be the key for the factory. Zhang’s hammer drove home his point: In 1993 Haier was awarded the “Chinese Famous Brand” accolade, and in 2006 Haier had a 25.5 percent market share of home appliances in China.

But in this rapidly changing world quality is not enough to guarantee the sustainable success of an enterprise, and innovation has become another key factor. Haier is not only solid but also flexible. In addition to being dominant in the home appliance market, Haier has entered into cutting-edge technology. In 1998 Haier developed on average one new product and applied for two patents every day. In the same year 236 research results developed into products. Haier owns more than seventeen hundred patents, which ranks it number one among Chinese enterprises.

Zhang Ruimin knows not only how to smash refrigerators with a hammer but also how to manage his complex corporation. Advanced management strategies are used in every procedure. New ideas are also introduced. Indeed, Haier’s management is a good case study in textbooks at Harvard and Oxford Business Schools.

Haier was born in China but has developed internationally. Globalization has presented Haier with more opportunities. Because of its strict quality control Haier has received market access to Europe and the United States (Haier passed international certification in forty-eight
countries, including the UL certificate in the United States, the CE certificate in the European Union, the ISO 90001 certificate for quality, which is issued by the International Organization for Standardization, and the ISO 14001 certificate for environmental protection. Haier’s products have been exported to more than eighty countries in Europe, Japan, the Middle East, Southeast Asia, and the United States. In addition, Haier has forty-nine overseas franchisers and an international logistics center in the Middle East and Germany. The “Three One-Third Principle” shows Haier’s globalization: One-third of its products are produced and sold at home; one-third of its products are produced at home and sold overseas; and one-third of its products are produced and sold overseas.

Where will Haier go in the next twenty years? Its officers and employees hope that, to invoke the company’s slogan, it goes “Haier and higher.”

Hainan Province
Hǎinán Shěng 海南省
8.45 million est. 2007 pop. 34,000 square km

The island province of Hainan is slightly smaller than Taiwan and located off of China’s south coast in the South China Sea. It is the only part of China that grows tropical crops. As a Special Economic Zone, Hainan attracted foreign investments and experienced brisk economic growth during the 1990s, although recently that growth has slowed.

Hainan, an island province in the South China Sea off the coast of China’s Guangdong Province, covers an area of 34,000 square kilometers. Before 1988, when the island was granted provincial status, it was part of Guangdong Province. The island has dense forests and a mountainous inland with the highest peak, Mount Wuzhi, rising to 1,867 meters above sea level. The coastal regions consist of plains, low hills, and volcanic terraces. The island has a tropical climate, with average temperatures of 22° to 26° C all year, but in extreme cases in the northern part of the island, temperatures may drop to 0° C. Annual precipitation varies; the west receives an average of 1,000 millimeters, whereas the southeast averages 1,500 to 2,600 millimeters and is frequently struck by typhoons.

About 12 percent of Hainan’s population belongs to the indigenous Li nationality. Another important minority nationality is the Miao. The province’s capital, Haikou (2006 population 830,192), is situated on the north shore. Several autonomous counties and townships are concentrated mainly in the middle of the island and on the south coast.

Since the Han dynasty (206 BCE–220 CE), the island has technically been part of the Chinese empire, but for long periods the Li evaded government control. During the Song dynasty (960–1279), when emigration from the mainland began, the island became part of Guangdong Province, a status that continued for centuries except for brief periods—during the Yuan dynasty (1279–1368) and from 1912–1921 when Hainan enjoyed independent provincial status. In imperial China, undesirable officials were commonly exiled to the island. Hainan was occupied by the Japanese from 1939 to 1945 during the War of Resistance against Japan, and since 1950 the island has been part of the People’s Republic of China.

Hainan is the only part of China that grows tropical crops. Forestry accounts for almost half of the agricultural output. The island also has a big rubber production and coconut farming, and other important tropical crops include cashew nuts, cacao, coffee, pepper, pineapples, bananas, carambolas, longans, litchis, and jackfruits. As one of China’s Special Economic Zones, Hainan attracted foreign investments and underwent rapid economic growth during the 1990s. The economy is mainly based on tourism, which is located on the south coast in the area around Sanya, and light industry, which is concentrated in the area around Haikou, and includes processed rubber and food, electronic articles, and textiles. The flow of outside investment to Hainan subsided drastically toward the end of the 1990s, however, and many unfinished construction sites have been abandoned.

The Hakka are an ethnolinguistic minority group. About 40 million live in China, mostly in the south, but it is thought that even larger Hakka populations exist outside China than within the country, in Malaysia, Australia, Canada, and the United States. They are known for their ethnic solidarity; the government considers them a part of the Han majority.

The Hakka are a Chinese ethnolinguistic minority group. The word Hakka means “guest people” or “newcomers” in Yue (Cantonese) and reflects their migration from central to southern China from about the ninth century into the early twentieth century. They tended to settle in distinct Hakka communities. About 40 million Hakka live in China. Most live in southern China, with Guangdong Province having the greatest concentration, particularly in northern Meizhou Prefecture. Sizeable populations also live in Fujian Province, Jiangxi Province, Guangxi Zhuang Autonomous Region, Hainan Province, Hong Kong, and Taiwan. More Hakka may live outside of China than inside it, with large overseas communities in Malaysia, the United States, Canada, and Australia. The Hakka language is classified with Yue and Min as a southern Chinese language.

As an ethnolinguistic minority and late arrivals in southern China, the Hakka often had tense and sometimes violent relations with the Yue- and Min-speaking Han. The Han considered the Hakka to be inferior and a tribal people. Research indicates that their origins are Han Chinese, and the government classifies them as Han. Hakka men and women were known as skilled and hardworking farmers who grew sweet potatoes, rice, and vegetables on harsh land ignored by non-Hakka farmers. They also often served in the military and outside China worked in construction and on plantations. In cities Hakka have been notably successful in academia, politics, and the professions. Well-known Hakka include China’s late leader Deng Xiaoping; Lee Teng-hui, Taiwan’s former president; Lee Kwan Yew, Singapore’s president; and Ne Win, president of Myanmar (Burma).

Both inside and outside China the Hakka are known for their ethnic solidarity, which may be a product of centuries of discrimination by the Han. Hakka interests are advanced by the Tsung Tsin (Cong-zheng) Association and the United Hakka Association.

Hakka Languages

Kèjiāhuà 客家话

The Hakka dialect group is very widely dispersed in the southern part of China due to different migration waves of different periods. As a result of historical sound changes and contact with other dialect groups, the unique criterion for distinguishing Hakka from other non-Hakka dialects is still unsettled.

The Hakka languages, or dialects, are one of the seven major language groups in China. (The other groups are Mandarin, Wu, Yue, Gan, Min, and Xiang). Hakka is also known as Aihua, Majiehua, Xinyinminhua, and Tuguangdonghua. In China Hakka is spoken in Guangdong, Fujian, Xiangxi, Hunan, and Sichuan provinces, Guangxi Zhuang Autonomous Region, and in Taiwan. Outside of China Hakka speakers are found in Indonesia, Malaysia, Singapore, Thailand, Brunei, Cambodia, Vietnam, and Laos. Estimates place the number of speakers worldwide at about 80 million.

Historical Hakka

Hakka comes from the Cantonese roots hak (guest) and ka (family/people). According to the historical records, five major migration waves of Hakka-speaking people, from the central plains of China to the south, have occurred. The first began during the Eastern Jin dynasty (317–420 CE). The Hakka-speaking people moved because of various non-Chinese invasions, civil wars, and clashes with local peoples. The term Hakka first appeared in Chinese historical documents during the Song dynasty (960–1279). During the late Ming dynasty (1368–1644) and early Qing dynasty (1644–1912), Hakka-speaking people migrated to northeastern Guangdong province. There they clashed with indigenous peoples over farmland. The local peoples referred to these new immigrants as Hakka. Squabbling between the Hakka and the indigenous population continued well into the twentieth century and contributed to the Hakka’s famed strong sense of ethnic and linguistic identity. The Hakka’s devotion to their mother tongue is illustrated by the well-known family precept, “One would rather sell one’s ancestors’ land than to forget one’s ancestors’ speech.”

Characteristics of Hakka Dialects

Because of the different destinations of the various waves of Hakka migration, several distinct Hakka dialects have developed. The standard is considered the Meixian dialect, spoken in northeastern Guangdong Province.

Hakka differs in a number of ways from Standard Chinese. Hakka, like Chinese, uses tone, the musical pitch of the voice, as a way to convey meaning in speech. Since the rise of Middle Chinese (about the seventh century CE), tones in Chinese have been classified into four categories: ping (even tone), shang (rising tone), qu (going tone), and ru (entering tone). Each tone may have undergone some
Hakka Languages

further split into two subcategories, yin and yang. But each tone category has evolved into different types of pitches, or tonal values, as reflected in modern Hakka dialects. Meixian Hakka has six tones: yin ping (high level), yang ping (low level), shang (low falling), qu (high falling), yin ru (short low level), and yang ru (short high level). Meixian Hakka has seventeen consonants: p, p', m, f, v, t, t', n, l, ts, ts', s, ng(n), k, k', h, o (zero initial); six (main) vowels: i, í, u, e, a, o; and three pairs of consonant endings: –m/–p, –n/–t, –ng/–k. The sounds represented by m and ng can also occur alone as distinct syllables.

The Hakka dialects are further set apart from other major Chinese dialects by their unique sounds, vocabulary, and use of word order. For instance, in the sound system of Hakka dialects, the sounds in Chinese represented by b, d, g, v, and z at the beginning of words are pronounced, respectively, p, t, k, f, and s. Also, most of the sounds in Middle Chinese represented by h are pronounced as f in Hakka.

Because the Hakka dialects share some common sound features and vocabulary items with Gan, Yue, and Min, some linguists have argued that the Hakka dialects should be grouped with Gan to form a Gan-Hakka language group. Others have assigned the Hakka dialects to a different group. And others have suggested that the Hakka dialects should be considered subdialects of the Gan-Yue dialect group. The current view is to treat Hakka as a separate language group.

Yan, Margaret Mian. (2006). Introduction to Chinese dialectology. Munich, Germany: LINCOM EUROPA.
The Han comprise the majority of the people among the fifty-six state-recognized nationalities (fifty-five minority groups and the Han) of mainland China and Taiwan. The largest nationality in the world, the Han are what people around the world generally think of as “the Chinese.”

The Han are the most numerous of the world’s nationalities, numbering about 1.27 billion in 2006, with sizable populations in Indonesia, Singapore, the United States, and numerous other locales. They are renowned for their highly distinctive and powerful languages and cultures, and for their long and eventful history. The main concentrations of Han Chinese are in the eastern half of China, as well as Taiwan. Under the People’s Republic of China, the state decides who belongs to which nationality. This decision is made based on Joseph Stalin’s rigid definition of what factors determine nationality. One group that on occasion has requested separate identity is the Hakkas, but the state considers them part of the Han nationality.

Population

In the mid-seventeenth century, China’s population was about 200 million, the overwhelming majority being Han. The 1953 census showed the Han population at 547 million, which was 93.9 percent of the People’s Republic of China (PRC) total. Census figures for 1990 and 2000 put the Han population at 1.04 billion and 1.16 billion, or 91.99 and 91.59 percent of the PRC total. Since the late 1970s, Han families in the PRC have been subject to a very strict policy rarely allowing more than one child per couple, without which the 2000 Han population would have been somewhat higher than it was. About 97 percent of Taiwan’s 2008 population of 23 million was Han.

At the end of the nineteenth century, there were an estimated 4 million overseas Chinese. In 2006 this figure had grown to about 40 million Chinese living outside China, Taiwan, Hong Kong, and Macao, and about 31 million living elsewhere in Asia. The country with the largest Han population outside China was Indonesia, with about 7.5 million Chinese. The country with the highest Han proportion was Singapore, where in an estimated 2005 total population of 4.27 million, 2.68 million (62.8 percent) were Han. In 2007 Hong Kong and Macao had combined total populations of about 7.5 million people, overwhelmingly Han Chinese in both places. Outside Asia the country with the largest Chinese population is the United States (about 3.38 million in 2005).

Language

Chinese belongs to the Sino-Tibetan family of languages. The Chinese written language dates at least to the fourteenth century BCE and consists of monosyllabic characters, or ideographs. The characters were standardized in the third century BCE and remain essentially unchanged even though the PRC adopted a simplified writing system in the 1950s. Literate Chinese have always been able to
understand each other through writing, which has acted as a unifying force throughout history.

Each character in the Chinese written language represents both a sound and a concept, but meaning is conveyed through characters either singly or in combinations. Chinese is not monosyllabic. Objects, actions, or ideas are more likely to be represented through groups of two or three rather than a single character.

Spoken Chinese is sharply regional and divided into several sublanguages and numerous dialects. All of these are tonal and express grammatical relationships through word order, not word endings. The official language is Modern Standard Chinese, or Mandarin, which is based on the pronunciation found in Beijing. The north and southwest of the Han regions of China (the eastern half of those territories ruled as part of the People’s Republic of China, plus Taiwan) are dominated by the Mandarin dialects, most of them intelligible to a speaker of Modern Standard Chinese. Sublanguages of the southeast include Yue (Cantonese), Wu (spoken in Shanghai), Hunanese, Jiangxi, North and South Fujian, and Hakka. In the south even dialects are often mutually unintelligible. Fujian is known for strong dialect differences from one valley to the next.

Approximately two-thirds of Han Chinese speak one of the Mandarin dialects as their mother tongue. In the twentieth century successive regimes have attempted to have Modern Standard Chinese spoken, or at least understood, by all Chinese through education, radio, and television. Of the southern sublanguages, Wu has the greatest number of speakers, followed by Cantonese.

Culture and Economy

Under Emperor Han Wudi (reigned 140–87 BCE), Confucianism dominated the Chinese state, including its ritual, and formed the ideological basis of duty and service for the scholar-official class that ruled the country. Confucianism placed great emphasis on morality within hierarchical human relationships, on creating and maintaining harmony within society, and on the family as the central social unit.

The Chinese people gather together in Tiananmen Square, to see the daily flag-raising ceremony. This is a popular tourist destination for visitors to the capital of the PRC.
Confucianism accorded greater social respect to men than to women and to sons than to daughters. Until the twentieth century, marriages were arranged by parents through the aid of matchmakers, and women were very subordinate. Although the revolutions of the twentieth century greatly raised women’s status, allowing them to enter the work force, gender equality is nowhere on the horizon among the Han, especially in the countryside.

Confucian ideology was one reason why Han governance was generally far more secular than that found in other great civilizations. In the twentieth century, Confucianism came under strong attack from modernist nationalism and Marxism-Leninism. Modernist nationalists denounced Confucianism as hierarchical, patriarchal, and oppressive, even though Confucianists argued that they were the real nationalists because they upheld Chinese values and traditions. Mao Zedong (1893–1976) orchestrated attacks on Confucian and religious values everywhere in China, but there has since been a major revival of Confucian influence in the PRC, and it remains strong in Han communities outside China.

Secularity of governance does not mean the Han are irreligious. To this day folk religions, which attempt to harmonize relations between humankind and the cosmic order, remain highly influential. Buddhism and Daoism still have Han followers, and their places of worship are common. But religions that emphasize belief in a single God have never attained more than minor influence among the Han. Muslims are never classified as Han, but as Hui.

Below the scholar-official, Confucianism prized the peasant. Han society is based on agriculture. The staple in the south is rice and in the north wheat-based products, supplemented by a wide variety of vegetables, dominate the Han diet. The meat most associated with the Han is pork. The Han do not care for dairy products, a taste even extensive Western influence has failed to change. To this day local markets are important for the economy.

During the Song dynasty (960–1279), China was the world’s most technologically developed society. Although Confucianism looked down on the merchant, China underwent a commercial revolution during that time, which produced a degree of prosperity that Marco Polo marveled at in the thirteenth century. But China later fell far behind technologically and failed to undertake an industrial revolution until the second half of the twentieth century. Under Mao the Han entrepreneurial spirit was suppressed. But since the late 1970s, it has revived, with heavy industry being replaced by more consumer-oriented enterprises and self-reliance by foreign trade.

The commonalities of the Han should not disguise important regional differences. These apply not only to language but also to many aspects of culture and society, including cuisine, festivals, clothing, marriage customs, village architecture, music, and theater. Cuisine provides one example. The Han of the southwest (Hunan, Sichuan, and Yunnan provinces) favor spicy dishes. In the southeast Cantonese food is noted for its quick cooking and stir frying at high temperatures and for rich, sweet dishes.

**Unity in the Twenty-First Century**

The strength of their culture and the size of their population have made the Han at times inwardly focused, at times outwardly focused. Although there are periods of division in China’s long history, and although localist elements remain influential to this day, the Chinese have shown a highly enduring sense of national unity. China’s joining the World Trade Organization late in 2001 should reduce isolationist tendencies but will not undermine the essential features of Chinese culture or eliminate nationalism.

Han Dynasty

One of the most dynamic periods of Chinese history, the Han dynasty was a time of political consolidation, military and economic expansion, invention, and empire building. The dynasty began with the fall of the short-lived Qin dynasty (221–206 BCE) after a widespread insurgency by peasants, soldiers, and nobles led by military commander Xiang Yu. The Han dynasty ruled by the prominent Liu clan was established in 206 BCE and created an empire based on militarism and economic power that endured to 220 CE. The Han was preceded by the Qin dynasty (221–206 BCE) and was succeeded by the Three Kingdoms period (220–265 CE). The Han dynasty arose following a brief civil war in which the Han defeated a Qin army in the Wei Valley and established a capital at Chang’an (western Shaanxi Province). It retained much of the Qin administrative structure but also established vassal principalities or kingdoms in some regions. Confucian ideals of governance, in disfavor during the Qin regime, were ultimately reinstated, and Confucian scholars attained prominent status in the civil service. During the more than four hundred years of Han hegemony, China prospered in agriculture, science and technology, commerce, military expansion, and empire building. Following a brief disruption in the dynastic succession, the capital was relocated east to Luoyang (Henan Province). By the first century CE, the Han population grew to about 55 million. The gap between a peasant proletariat and landowning dynasty class widened, and the wealthy became more independent and relied less on the central government. Overexpansion coupled with domestic intrigues and foreign pressures led to a political fragmentation and the rise of the Three Kingdoms after 220 CE.

The dynastic history is divided into two periods: the Former Han dynasty (Qianhan 前漢) or Western Han dynasty (Xi Han 西漢), conventionally 206 BCE–24 CE, seated at Chang’an; and the Later (or Latter) Han dynasty (Hou Han 後漢) or Eastern Han dynasty (Dong Han 東漢) 25–220 CE.
Former or Western Han: 206 BCE–23 CE

Widespread insurgency by peasants, soldiers, and nobles led by a military commander named Xiang Yu against the Qin dynasty (221–206 BCE) resulted in that monarch’s death and the formation of the Han dynasty in 206 BCE. Xiang Yu divided the country into nineteen feudal kingdoms. But he lacked political acumen and Liu Bang (who posthumously became Emperor Gao Zu) gained control and became sovereign from 202–195 BCE. Some scholars date the Han dynasty to the fall of the Qin in 206 or to the ascendancy of Gao Zu in 202. He consolidated Han power and reorganized the country into ten feudal states. Three administrative branches of ex-Qin governance were retained: chief counselor (chengxiang), grand marshal (taiwei), and inspector-in-chief (yushi dafu). The chief counselor ruled nine chief ministers and oversaw thirteen governmental departments.

Emperor Gao Zu was succeeded by his son Hui Di, although Gao Zu’s widow (a member of the rival Lu clan) retained great political power; Hui Di reigned from 194–188 BCE and was replaced by infant rulers under her control (Shao Di Gong, 188–184 BCE, and Shao Di Hong, 184–180 BCE). When she died in 180 BCE, administrators restored the Liu clan and named Wen Di as monarch. He brought an era of economic prosperity in government and social reform, but was opposed by princes of the imperial family. Barbarians from the north (Xiongnu) conducted cavalry raids into Han territory but were repulsed by Han armies, and a peaceful, albeit transitory, alliance was eventually negotiated. Wen was succeeded by his son, known as Jing Di (156–141 BCE), who faced a serious uprising known as the Revolt of the Seven Kingdoms in the year 154 BCE, which was led by princes of the imperial family who had gained wealth and power in southern Han territory. Because of the threat of the accumulation of power by these feudal princes, Emperor Wen and his successor deprived them of the right to appoint their own ministers and forced the princes to divide their lands among their sons, thereby diluting their resources for potential future uprisings.

Emperor Jing Di’s son, Wu Di, took office in 140 BCE and remained in power until 87 BCE. Central powers were reinforced, skilled officials recruited, and the Qin calendar and emblems abandoned. He also enhanced and greatly expanded road and riverine communications systems for political and economic control. This was an era of great military expansion into Korea and Central Asia, attacks on the Xiongnu, initial economic prosperity, tax reduction, and China’s lip-service adoption of Confucianism, displacing Daoism. A Grand School (taixue, a kind of university) was created, and essays called Five Classics (separate books on changes, documents, odes, rites, and annals) became the official moral and political ideology of the state. The colonization of the northwest frontier south of the Gobi Desert during his reign involved the transfer of an estimated two million colonists from the east. But this fifty-year period of foreign adventures, war and territorial expansion, and domestic expenditures—notably for extravagant diplomacy and a magnificent court—left the empire in a state of unrest and the treasury greatly diminished.

At the age of eight, Wu Di’s son became sovereign (87–74 BCE); during his reign as Zhao Di, the government was administered ably by Minister Ho Kuang. A grandson of...
Emperor Wu Di, Liu He (Prince of Changyi) was to succeed to the throne, but he did not follow appropriate protocols in mourning his predecessor and was stripped of the office by Ho Kuang. Therefore, he was replaced by Wu Di’s great-grandson, who became Xuan Di (73–48 BCE). His reign was one of great prosperity in agriculture and foreign relations; notably, the Xiongnu accepted Han sovereignty. By the first century BCE, the capital, Chang’an, reached its greatest extent. Rectangular in shape and laid out on a north-south axis, it housed palaces, administrative buildings, arsenals, two large markets, and elite residences, and was protected by a 25-kilometer wall around the perimeter. Next to Rome, it was the largest city in the world at its time.

Emperor Yuan Di (48–33 BCE), son of the previous sovereign, diminished government expenses, expanded welfare for the peasants, and promoted Confucians and eunuchs to high offices. But he erred in granting great power to his Wang-clan maternal relatives and enhanced the authority of the eunuch secretaries, thereby diluting central authority and setting a precedent that would result in the demise of the dynasty. Yuan Di’s son, known as Cheng Di (32–7 BCE) was a weak ruler who further gave additional control to the Wang clan. Three other short-term sovereigns (Ai Di, 7–1 BCE; Ping Di, 1 BCE–5 CE; and Emperor Ruzi Ying, 6–8 CE) were ineffective rulers.

**Xin Dynasty: 9–23 CE**

The dynastic succession was interrupted by Wang Mang, who established the Xin dynasty (9–23 CE). His radical reforms during this interregnum were ineffective. The nephew of the widow of the sovereign Yuan Di, he was eventually overthrown by a peasant secret society called “Red Eyebrows” (so-called because they painted their eyebrows red) and killed in 22 CE by an army of nobles under the leadership of Geng Shi Di (23–25 CE).

**Eastern or Later Han: 25–220 CE**

Guang Wu Di of the Later or Eastern Han, an educated Confucian scholar who served as emperor from 25 CE to 57 CE, won the support of other aristocratic clans who dominated Han society and established great estates worked by tenant farmers and slaves. Based on the accumulation of wealth and supported by a bureaucracy drawn for these supporters, he moved the capital eastward to Luoyang (in present-day Henan Province) in the year 25 CE. The city was organized along a north-south axis, encompassed about four square miles, and would become one of the largest cities of the ancient world, with a population exceeding...
one-half million. It functioned as an administrative and commercial center and international marketplace. Two palace complexes each covered 125 acres. There were separate wards or districts for foreigners (usually merchants or envoys from other lands). Central Asian envoys came in 94 CE, west Asian jugglers in the year 122 CE, and Japanese diplomats in 57 CE and 107 CE; economic links with Rome are documented in 166 CE. The central government became weaker and relied more on private armies for the protection of the state. Guang Wu Di’s son, known as Ming Di (58–75 CE) initiated the conquest of Turkestan, but upon his death, Zhang Di (76–88 CE) succeeded to the throne and favored an isolationist policy for the homeland. By this time, the dynasty was in disarray and a succession of minor rulers became sovereigns (He Di, 89–105 CE; Shang Di, in the year 106 CE; An Di, 106–125 CE; Shao Di, the Marquess of Beixiang, in 125 CE; and Shun Di, 125–144 CE). By the year 100 CE, Buddhism, which likely had reached China in 60 CE and is documented in the form of rock carvings at the site of Kungwangshan in Jiangsu Province, began to make inroads into Han Chinese culture. An Qing (also known as Anshigao), a Buddhist missionary from Parthia, was active in the Luoyang area in 148 CE. As political corruption led to internal struggles for power and divided the peasantry, the succeeding sovereigns (Chong Di, 144–145 CE; Zhi Di, 145–146 CE; Huan Di, 146–168 CE; and Ling Di, 168–189 CE) were weak emperors. A revolt, led by the “Yellow Turbans,” began in 184 CE and served to unite the divided peasant factions. But the defeat of these revolutionaries further weakened the dynasty and did not result in Han China returning to a united state. Dong Zhou, a military dictator, arranged for the succession of eight-year old Xian Di (189–220 CE). A series of warlords succeeded Dong Zhou following his assassination in 192 CE. Ts’ao Ts’ao gained control and was opposed by other militarists who controlled the western and southern regions of the disintegrating empire. Upon his death in 220 CE, the three regions emerged as independent polities called the Three Kingdoms, and the Han dynasty came to an ignominious end.

Han Sociopolitical Organization

The Han bureaucracy was both centralized and local, with the former including cabinet officials (called Three Lords and Nine Ministers), led by a chancellor who was also one of the lords. During the Western Han period, there were local administrative levels, approximately 1,180 sub-prefectures, and counties; governors of the latter had great autonomy and were delegated legal, economic, and military authority by the central government, including powers of taxation and conscripting corvée labor. Slaves were
both private and state-owned. Officials were appointed to office on the basis of skills rather than clan affiliation. A professional civil service developed, and record-keeping enhanced the ability of the emperor to tax his subjects and expand the empire.

The Han empire expanded to encompass most of present-day Mongolia and continued westward to Lake Baikal (in present-day southern Siberia), eastward to northern Korea and Japan, and southeast to Gansu and Vietnam. Han political and cultural influence extended westward through the Tarim Basin (the modern Xinjiang Uygur Autonomous Region) and portions of central Asia, notably most of the former Soviet central Asian states to the Caspian Sea (including portions of present-day Kazakhstan, Turkmenistan, Uzbekistan, Kyrgyzstan, and Tajikistan), as well as northern Afghanistan and eastern Persia (Iran). The conquest of Dayuan (the Ferghana Valley and adjacent regions in Central Asia) in 101 BCE gave the Han the opportunity to seize long-legged “celestial” horses (tianma); unlike the Han’s short-legged Mongolian ponies, they greatly enhanced the Han cavalry speed and mobility. There was a notable military campaign in Xinjiang (Chinese Turkestan) in 73 CE to maintain the trading monopoly. The so-called Silk Roads (a series of east-west and north-south commercial routes used for millennia) facilitated caravan trade between China and the West, notably for the export of Chinese silk, gold, bronze artifacts, and porcelain. In return, the Chinese received woolen fabrics, glass, pottery, spices, grapes, wine, sesame, pomegranates, alfalfa, and a variety of other Western foods. A tribute system developed in which non-Chinese polities remained autonomous in exchange for a symbolic acceptance of the Han as overlords.

Sima Qian (145–87 or 80 BCE), a Chinese historian, wrote Records of the Great Historian (also called Historians’ Records or Shiji), which was facilitated by the invention of paper; this was the initial attempt to document Chinese history in book form. This 116-chapter work set a standard for government-sponsored histories that continued into the twentieth century. The compilation of encyclopedias and other books, such as Book of the Mountains and Seas (a geography and natural history), expanded education and the rise of literate gentry. The arts, including calligraphy (with texts on wooden and bamboo slips or on silk), poetry, literature, philosophy, music, painting, and mural art flourished, as did medicine and alchemy and imperial cults oriented to magic and sorcery.

Han Economic Organization

Since 119 BCE, the state sought to monopolize the production of iron and salt, and less so copper working and silk weaving, which remained in both private and federal hands. Iron tools, especially the swing plow drawn by yoked oxen, allowed agricultural productivity and expansion, which necessitated the construction of irrigation systems (dams, dikes, and canals). Crop rotation was practiced from 85 BCE onwards. Chinese inventions during this era included paper, porcelain, the compass, water clocks, sundials, astronomical instruments, the seismometer, water wheel, the hydraulic trip-hammer, piston bellows, and...
the forging of steel. Terracotta figures; textiles; gold, silver and bronze working (including gilt bronzes); lapidary in semiprecious stone; jade carving; wood working; and lacquer wares are among the crafts that flourished. Ceramic spirit models (minqiqi) in the form of soldiers, attendants, entertainers, and other human depictions expanded to include house models, towers, granaries, wells, stoves, farm scenes, and other implements and accoutrements. Scholars interpret these as marking a change from mystical beliefs regarding the afterlife to a presumption that the activities of everyday life would continue after death. Pure rag paper is known from the second century BCE and was mass produced by the early first century CE; hemp paper was developed in 109 CE.

By 100 BCE, monumental stone sculptures were erected in public areas and placed on tombs, and by the first century CE, clusters of stone monuments and figures lined avenues or “spirit roads” leading to imperial tombs (replacing the terracotta armies of earlier dynasties). Tombs for the imperial family and official and nobility contained elaborate burial goods that document the lives of rich landowners and traders in contrast to peasant poverty and slavery.

The Han created the first centralized state and conducted major military expansion into Mongolia, Manchuria, Korea and Central Asia, as well as advances into Southeast Asia. The period was characterized by technical progress and economic expansion that enhanced merchants and gentry. Culturally this was the zenith of classical studies and an intellectual renaissance with courtly literature, scholastic philosophy, and the performing and graphic arts including music, theater, painting, and textiles.

Han Rhapsodists

The *fu* 賦 (rhapsody or prose-poem) developed during the Han era as the dominant literary genre, and it continued to be composed by many later major writers. *Fu* initially meant a presentation, usually at court, of narrative compositions. Such compositions later included more personal literary expressions that served as vehicles of Confucian, Daoist, and Buddhist ideas.

Although the *fu* (rhapsody) is principally associated with the Han era (206 BCE–220 CE), when it developed as the dominant literary genre, it was occasionally composed, often in sophisticated and new ways, by many later major writers, including Li Bai 李白 (701–762 CE), Bai Juyi 白居易 (772–846 CE), Ouyang Xiu 欧阳修 (1007–1072), and Su Su 蘇軾 (1037–1101). Although it rarely attained literary significance after the thirteenth century, it was still occasionally used as a vehicle to commemorate court, official, and private ritual occasions.

Originators

The earliest range of meaning of *fu* suggests how it became the name for a literary genre: first it was the word used for *tax* or *levy* (as both verb and noun); then, *pay* tax or provide *levy*; next, more generally, *provide*, *present*, *submit*, and specifically *create* or *present* a poem or song at a royal banquet; and later to designate one of the three rhetorical figures, or modes, of expression in the odes of the *Classic of Poetry* (Shijing 詩經): *xing* 興 (evocative image), *bi* 比 (simile), and *fu* 賦 (straightforward description/narration). During the early Han, the term *fu* thus came to mean a presentation, usually at court, of descriptive and narrative compositions. Such compositions later included more personal literary expressions.

The *fu* seems to have originated from three sources: (1) chapter 26 of the *Xunzi 荀子* (Sayings of Master Xun) of Xun Qing 荀卿 (c. 335–c. 238 BCE), which contains five riddles together with answers, parts of which are in rhymed four-syllable lines called *fu*; (2) formal and expressive features of the *Lisao 遊騷* (Encountering Sorrow) of Qu Yuan 屈原 (c. 340–c. 278 BCE) and the *Chuci 楚辭* (Elegies of Chu), traditionally attributed mostly to Qu and his literary disciple Song Yu 宋玉 (c. 290–c. 223 BCE) but likely in some cases to be as late as the early Han and thus contemporary with the rise of the *fu*; and (3) literary materials called *fu* presented in various official, court, and ritual contexts, characterized by elaborate diction, florid exposition, and ornate description. These elements appear in early works such as the *Zuo zhuan 左傳* (Zuo’s commentary to the *Chunqiu 春秋* [Spring and Autumn Annals]), of uncertain date but likely no later than the third century BCE, and in the *Zhuang zhi 戰國策* (Intrigues of the Warring States), which contains texts that date from 454 to 209 BCE. The core of such addresses and presentations likewise consists of four-syllable rhymed lines.

But 174 BCE is the earliest date for any Han *fu*: the *Funiao fu 鳥鳥賦* (Rhapsody on the Owl) by Jia Yi 賈誼 (200–168 BCE). Jia’s is a transitional composition that
contains elements from both the Chuci (Elegies of Chu), the so-called sao 誠 style—with its flexible form and most syllables ending with the exclamatory syllable xi—and new elements that characterize the Han fu. Although it contains four-syllable lines with one or more end rhymes per stanza, the exclamatory interjection syllable xi (Han pronunciation, ghei) often occurs between two four-syllable quasi-lines to make nine beat lines, or occasionally as six syllables + xi + four syllables to make eleven syllable lines, or to set off topics at the beginnings of individual lines. Some lines, either four or six syllables, as in the mature Han fu, lack a xi entirely. In tone and theme, it also shows more affiliation with the Chuci than the majority of early Han fu. Instead of presenting lengthy objective description and public-oriented rhetoric, it explores a personal state of mind and emotional outlook. When an owl, harbinger of ill fortune, flies into Jia's studio (like Edgar Allan Poe's raven), it sets him to pondering the uncertainty and impermanence of life. Jia is saved from hopeless pessimism by recourse to the transcendent philosophy of the Zhuangzi, whose texts he reworked to affirm the equality of fortune and misfortune, life and death.

**Early Composers**

By the time of Emperor Wu (141–87 BCE), the fu reached maturity, largely through the efforts of Sima Xiangru 司馬相如 (c. 145–c. 86 BCE), whose compositions set the standard for form and content. They were elaborate and exhaustive descriptions of real or imagined places and things conveyed by an encyclopedic vocabulary, often couched in rhetoric designed to persuade and admonish. Although Sima is known to have written at least twenty-nine fu, of those surviving, only four are considered genuine. The first two are Zi Xu fu 子虚赋 (Master Fictitious Rhapsody) and Shanglin fu 上林賦 (Rhapsody on the Shanglin Park). They originally were two halves of one fu, the Zi Xu fu, but were later divided and given separate titles. They recount in the voices of Master Fictitious and two other imaginary figures the glories of Emperor Wu’s great hunting park. The third is the Ai Qin ershi fu 哀秦二世賦 (Lament for the Second Qin Emperor Rhapsody), which warns of the dangers of misrule. And the fourth is the Daren fu 大人賦 (Great Man Rhapsody), which recounts the virtues of the true sovereign in terms of the perfect sage, or great man, of Confucian and Daoist lore.

Several other Former Han fu writers are considered among the best of the entire Han era. Mei Cheng’s 松乘 (d. 140 BCE) best known rhapsodies are the Qifa 七發 (Seven Stimuli), composed to admonish the world-weary and ill Han crown prince that he should recover health and spirit so he could again engage with the world, with all its sensual, aesthetic, and intellectual delights, described in great and loving detail. Mei also composed the Liang Wang Tuyuan fu 梁王苑頴賦 (Rhapsody on the Dodder Park of the King of Liang), which describes the scenic beauty and recreational pleasures found in the Liang princely domain hunting park. Wang Bao 王寔, who served at the court of Emperor Xuan (reigned 73–49 BCE), is best known for his Dongxiao fu 洞簫賦 (Rhapsody on the Panpipes), which relates the source of the instrument—beginning in gorgeous forests where bamboos from which it is made lushly grow, through noble craftsmen who make it with great skill and ingenuity, to musicians who play it across a wide spectrum of rhythms and modes and conjure up visions rich in moral effect and full of intellectual and aesthetic value, and concluding by likening the sound of panpipes to the sounds of nature, especially the movement of water and the breath of wind, with their cosmic implications for moral transformation.

Yang Xiong 楊雄 (53 BCE–18 CE), active at the court of Emperor Cheng (reigned 32–7 BCE), among other duties, accompanied the emperor and his entourage to sacrificial ceremonies and imperial hunts, which resulted in two ceremonial fu: Gaquan fu 甘泉賦 (Rhapsody on Sweet Springs Palace) and Hedong fu 河東賦 (East of the River Rhapsody), and two hunting fu: Yule fu 羽獵賦 (Rhapsody on the Feathered Arrows Hunt) and Changyang fu 長楊賦 (Rhapsody on the Wide Stretch of Weeping Willows Palace). Although full of praise for the grandeur of the events and the emperor’s demonstrated virtue, all four contain subtle warnings against extravagance and thus function also as a teachable moment.

**Classical Composers**

An even greater number of excellent fu writers appeared during the Later Han, of which four deserve especial attention. The historian Ban Gu 班固 (32–92 CE) as a literary writer is best known for his Liangdu fu 兩都賦 (Two Capitals Rhapsody), which describes the two Han capitals,
Chang’an 長安, the western, which served as capital for the Former Han, and Luoyang 洛陽, the eastern, which served as the capital for the Later Han. Both parts provide detailed accounts of historical events, with loving depictions of the natural and manufactured sights of the two cities as well as their larger geographical settings, accounts of the doings at court, and the virtue of successive emperors. It concludes with confirmation of the eternal political and cultural significance of the two capitals. Ban’s earlier Youtong fu 邁通賦 (Rhapsody on Communicating with the Hidden), in the archaic sào style, is quite different. It explores the realm of hidden gods, sagely spirits, divine maidens, and other members of the spirit world, through which Ban, then perhaps twenty-two years of age, roams in imagination, consciously copying the quest theme of the Lisao (Encountering Sorrow) in which Qu Yuan undertakes a journey in search of a virtuous sovereign to serve. Ban by contrast seeks advice from the spirit world on how he should conduct a successful life, now that his father has just died and he wishes to continue his family’s good name. Another long quest fu is by Zhang Heng 張衡 (78–139 CE), the Si xuan fu 思玄賦 (Rhapsody on Contemplating the Arcane), also in sào style and with Qu Yuan clearly in mind. Inspired by the sad conclusion that the good man rarely finds the world a congenial place, Zhang imaginatively wanders through the mysterious spirit world in search of the Heavenly Way, seeking advice on how to cope with the hostility and suspicion he meets in official life. Although his quest ends in frustration, he resolves to retire and lead a quiet life in the country, cultivating himself and studying the teachings of the ancient sages. Zhang wrote a short sequel, Guitian fu 歸田賦 (Rhapsody on Returning to the Fields), not in sào style but in standard fu six and four syllable lines, which rejoices in his release from the snares and delusions of official life and in his newfound simple joys of country living.

**Late Composers**

Closing the Han era is Wang Can 王粲 (177–217 CE), an original writer who excelled in all forms of literature, including the new short lyric poem, the shī 詩, as well as the fu. Wang’s fu tend to be short, full of direct and intimate description and intense feeling. It is likely that this late Han development of the fu, as seen in the works of Wang Can and his contemporaries, into much shorter and more lyrical compositions is due to influence from the shī, which was then rapidly becoming the new dominant literary form. Wang’s Denglou fu 登樓賦 (Rhapsody on Climbing the Tower) was composed sometime after 193 CE while he was living in Jiangling 江陵 (present-day Jingzhou 荊州, Hubei), where he escaped to avoid the chaos caused by the imminent collapse of the Han. In it Wang describes and praises the marvelous scenery viewed from atop a wall tower, probably on the Maicheng 麥城 city wall not far from Jiangling. But it is not his home, and, although he strains his eyes toward the northwest, his view is blocked by mountains, reminding him of the vast distance involved. Overwhelmed with sadness and worry, he realizes that only the recovery of political and military stability, which he fears is unlikely to come soon, will allow his return home.

To round out this account of the Han fu, it is necessary mention the following age of disunity, the Three Kingdoms era, and the fu of Cao Zhi 曹植 (192–232 CE), third son of Cao Cao 曹操 (155–220), military strongman and usurper of Han rule and younger brother of Cao Pi 曹丕 (187–226), Emperor Wen, first emperor of the Wei dynasty. Cao Zhi’s most famous fu, widely appreciated throughout the tradition, is his Luoshen fu 洛神賦 (Rhapsody on the Luo River Goddess). No evidence exists to indicate why Cao composed this work, but speculation over the centuries has proposed several theories. The Luo River goddess represents Empress Zhen 甄, his brother’s wife, whom he supposedly loved. Because the goddess was beyond human reach, so too was this forbidden earthly love for him, so he wrote the Luoshen fu to express allegorically his love and longing. Another theory claims that this rhapsody should be understood as an expression of Cao Zhi’s frustration at not being given high office at the Wei court by his brother but instead often kept at a distance in politically insignificant “cushy” jobs. The goddess allegorically represents his brother, whose attentions and affections are denied him. Yet another theory says the rhapsody was inspired by legends of the Luo River goddess, supposedly the daughter of the ancient sage ruler Fu Xi 伏羲, who drowned in the Luo and was subsequently worshiped as its protector deity. Cao Zhi draws on this legend when on a journey he halts above the Luo, looks down, and supposedly has a vision of the goddess in all her beauty and glory. There is no way of knowing if the resulting composition was the articulation...
of a vision in the psychological or spiritual sense, a playful but erudite literary invention, a voluptuous description and expression of passionate love for some unidentified woman, or perhaps, simply, a clever verbal concoction designed to enrich lore surrounding the local goddess. Nevertheless, with Cao Zhi the fu was becoming more infused with complexity, expressive subtlety, and layers of meaning, characteristics of many fu composed during the centuries that followed by such masters as Ji Kang 晉康 (223–262 CE), Pan Yue 潘岳 (247–300 CE), Lu Ji 陸機 (261–303 CE), Tao Qian 陶潛 (365–427 CE), and Yu Xin 畲信 (513–581 CE), whose works in this genre have always been regarded as among the great masterpieces of Chinese literary art.

Poet, essayist and Confucian thinker, Han Yu is considered to be one of the foremost writers of the Tang dynasty, whose carefully wrought prose greatly influenced the literature of China and whose ideas helped establish neo-Confucianism.

Han Yu, born in Heyang, Henan Province, and orphaned at the age of six, was one of the greatest prose writers of the Tang period (618–907 CE). His philosophical works inculcated Confucianism tenets and his prose style brought about the Old Prose Movement.

Han Yu was raised by his older brother, an accomplished singer, and an uncle, a well-known prose writer. These early influences charted the course of his own life, as he set about from a very early age to study for the imperial examinations to gain a government position as a scholar-official. He sat for these examinations on three separate occasions, but failed each time. It was only on his fourth attempt that Han Yu passed and by 802 was successful in acquiring a post at court. However, he was overly outspoken and critical of the way government officials behaved and the royal refusal to rescind certain taxes during times of famine. Han Yu’s criticisms of the government were expressed in his works, particularly *Study of the Five* and *Study of the Way*, in which he advocated an adherence to the guiding principles of Confucianism. Before long he was sent into exile by the emperor Dezong.

In time, Han Yu was rehabilitated and given various minor posts in far-off cities, away from the royal court. He might well have lived out his life in such remote places had he not taken up a cause significant to his beliefs. During the Tang period, the influence of Buddhism and Daoism was expanding rapidly in China. Han Yu, as a committed Confucian, detested these new and foreign influences. When Han Yu learned that the new emperor, Xianzong, would take part in a procession honoring a Buddhist relic, he famously sent off an open letter to the emperor titled *Memorial of the Bone of the Buddha*, reminding the emperor of the nobility of the Confucian way and openly deriding anyone who chose to follow foreign, non-rational ideologies that did nothing to further Confucian morality in the kingdom. According to Han Yu, Buddhism and Daoism represented a great threat to Chinese society because both belief systems were concerned solely with the other-worldly, meaning that people did not concern themselves with the here-and-now and with bettering society, as advocated by Confucianism. In addition, Han Yu saw the emperor as the central authority for the betterment of society. Thus, if the emperor gave himself over to worrying about the hereafter, he would neglect his Confucian duty to rule over a peaceful and just kingdom.

Han Yu’s critical letter enraged the emperor, who ordered Han Yu’s immediate execution. But friends of Han Yu, and those who followed Confucianism, convinced the emperor to order exile instead, which the emperor promptly decreed. When another emperor, Muzong, ascended the throne, Han Yu sent another
letter, this time of apology, and he was allowed to return to Ch’ang-an, where he was given various posts until his death. Han Yu is best remembered for his clarity of style. He stripped off the frivolous ornamentations that had encumbered literary prose; his writing was concise and uncluttered. This methodology was derived from his devotion to Confucianism and the canon of Confucian writing, which advocated a life of frugality and honesty without vanity.

In his writings, Han Yu sought to elaborate the workings of an ideal Confucian society, in which the ruler, his officials and his people would have clearly defined duties and obligations. However, in his own lifetime, he was considered a minor thinker. It was only during the Song Dynasty that he was rediscovered and his work was elevated as a worthy example of Confucian thought. Thereafter his influence upon Chinese thought grew unabated.

Han Yu was a poet and a Confucian thinker. His carefully wrought essay style earned him a reputation as one of greatest prose writers of the Tang period. This image was included in a book of portraits of famous poets called Wan hsiao tang-Chu chuang—Hua chuan, which was published in 1921.
Hangzhou

Hangzhou, the capital of Zhejiang Province, is a city near the East China Sea coast with a rich history; its Zhejiang University is considered one of the best in China. Hangzhou’s green tea (Longjing tea) is renowned for its high quality. Tourists and surfers know the city as the location of the world’s largest tidal bore, the so-called Qiantang Dragon.

Hangzhou has long been regarded as one of the most beautiful cities in China; there is a popular Chinese saying that “above the earth, there is the heaven, on the earth, there are Suzhou and Hangzhou” 上有天堂，下有苏杭. It is located on the Fuchun River near Hangzhou Bay on China’s east coast, north of the Qiantang River, and is situated at the southern end of the Grand Canal, the world’s longest artificial river.

The city of Hangzhou was founded about 2,200 years ago during the Qin dynasty (221–206 BCE) and is listed as one of the seven ancient capitals of China. When the capital of the Song dynasty, Kaifeng, was captured by the Jin (an ethnic-minority dynasty ruled by the Jurchens) in 1126, the Song court fled south to set up the capital in Hangzhou, which they named Linan. The Song capital remained there until the Mongol invasion conquered China in 1276 and set up its capital in contemporary Beijing.

Hangzhou is a city famous for its natural beauty: The Qiantang River to the south and West Lake (Xihu) to the west surround the city environment with the

The multistoried Liuhe Pagoda in Hangzhou, reconstructed in 1165 after the original was destroyed in warfare in 1121, during the Song Dynasty. Photo by Joan Lebold Cohen.
tranquil scenery of water and hills. The traveler Marco Polo (1254–1324) described Hangzhou as one of the most splendid cities in the world when he passed through during the thirteenth century. The West Lake covers an area of six square kilometers and is surrounded by scenic hills, temples, and pagodas. Across the lake are two beautiful dikes with willow trees and bridges: Su Ti (Su Dike) was built by Su Zhi, and Bai Ti (Bai Dike) was built by Bai Juyi. Both men were famous Tang dynasty (618–907 CE) poets.

On the Qiantang River, the world’s largest tidal bore, or wall of water, can race across Hangzhou Bay when conditions are right. When the tide is coming in, the bay’s tunnel shape can create a spectacular wavelike bore from 1.5 meters to 4.5 meters high (although it has been measured as high as nine meters) that sweeps past Hangzhou. This unique natural occurrence, referred to as the Qiantang Dragon, has become very popular with seasonal tourists, especially during autumn, when the tides tend to be strongest. The river tides in the Qiantang River have taken place twice a day since time immemorial. Because
of the moon’s gravitational pull, the biggest tides take place in the first four days of a month in the lunar calendar, and then again from the sixteenth day to the nineteenth day.

Hangzhou Bay also is now spanned by the world’s longest over-ocean bridge, the Hangzhou Bay Bridge. After five years of construction, the 36 kilometer bridge opened in 2008, linking the cities of Shanghai and Ningbo and cutting travel time between the two from four hours to two.

Economically, Hangzhou is famous for the production of tea and the silk and textile industries. Hangzhou is best known for growing some of the finest green tea in China—Longjing tea, which means “Dragon Well” tea. The most famous, Xi Hu Long Jing, is from the West Lake region.

Hangzhou also is the center of the silk industry. The biggest company, Dujingsheng Silk Company, has a museum in Hangzhou that explains the silk-making process, from silk worms on the leaves of mulberry trees to the manufacture of silk cloth. There are also exhibits on the art of silk weaving that include a vivid portrait of Chairman Mao Zedong in silk.

Hangzhou has two famous national universities (Chinese Academy of Art and Zhejiang University), ten public universities, and two private universities. (A national university is funded at the national level; public universities are funded by the provincial and municipal levels.) Zhejiang University, founded in 1897, is one of China’s most prestigious comprehensive universities. The British academic and sinologist Joseph Needham visited Zhejiang University in 1944, calling it the “Cambridge of the East.” From 1952 to 1998, however, Zhejiang University was split up into a number of single-discipline

institutes based on the government policy that read-
justed China’s tertiary education system in 1952. In 1998,
the new Zhejiang University was established, combining
four major universities: Zhejiang University, Hangzhou
University, Zhejiang Agricultural University, and Zheji-
ang Medical University. Since then, Zhejiang University
has become a comprehensive university with twenty-five
colleges and schools.

According to a 2008 national ranking by the China
Academy of Management, Zhejiang University is third
after Tsinghua University and Peking University; a 2007
ranking by the École National Supérieure des Mines de
Paris placed Zhejiang University first in China and num-
ber thirty-four worldwide. The notable alumni and faculty
of Zhejiang University include many officials of the Chi-
nese Communist Party, government ministers, university
presidents, and Nobel Prize winners. Notable faculty have
included Chang Chi-Yun (1900–1985), the Minister of Ed-
cucation of the Republic of China (Taiwan) and founder
of the Chinese Cultural University in Taiwan; and Noble
Prize laureate (Physics, 1957) Tsung-Dao Lee (b. 1926).

Hanlin Academy (Hanlin Yuan)

Hànlínyuàn 翰林院

Founded as a personalized consulting group for the Tang emperors, Hanlin yuan (翰林院 Hanlin Academy)—a common variant for Hanlin xueshi yuan (Institute of Academicians)—later evolved into a prestigious cultural and secretarial apparatus staffed with the best educated and most ambitious elites involved in imperial politics at the highest levels of both the inner and outer courts.

The Chinese character han in hanlin (“a grove of han”) literally means “feathers” and, by extension, “Chinese writing brush” and then “professional writer.” Since the beginning of the Tang (618–907 CE), a group of so-called talents awaiting orders (daizhao) was summoned to serve the emperor’s offhand needs. The group included writers (cixue or wenci), classical scholars, alchemists, diviners, shamanists, astrologers, physicians, fortunetellers, Buddhist and Daoist priests, calligraphers, painters, and chess masters. Over time some writers were singled out to become academicians in attendance (Hanlin gongfeng) and later, by 738, Hanlin academicians (Hanlin xueshi). The Hanlin Academy (Hanlin xueshi yuan) was duly established under Emperor Xuanzong (reigned 712–755) to organize these academicians.

The office of the Tang Hanlin Academy was near the

Hangzhou

Bai Juyi (772–846). This famous poet of the Hanlin Academy was known for his bleak style. Poets, along with alchemists, diviners, shamanists, astrologers, physicians, fortunetellers, were on hand at the academy to serve the Emperor’s needs.
Evolution of the Hanlin Academy

During most of the Song dynasty (960–1279), Hanlin academicians stayed in the imperial inner quarters, as they were still largely regarded as the “private men of the Son of Heaven” (tianzi siren). However, unlike their Tang predecessors, Song academicians, beginning with the Yuanfeng period (1078–1085), were formally ranked and thus were formal officials. Continually recruiting academicians from the scholars who had earned the jinshi degree in civil service examinations, the Song Hanlin Academy became a more complex institute. Following the Tang career model, nearly half of the Song Hanlin academicians became counselors-in-chief.

The Hanlin Academy moved out from the inner imperial quarters in the early 1440s under the Ming (1368–1644). Its relationship with the imperial house became more distant and formal, as the Ming emperors ruled more directly through other apparatuses, such as the highly personalized Grand Secretariat (Neige). As a formal bureaucratic institute, the Ming Hanlin Academy further expanded to include more than a dozen ranked posts, all with designated duties that included drafting edicts, helping emperors to study and write, educating princes, editing books, and compiling dynastic histories. This bureaucratic tendency continually developed under the Qing (1644–1912). In its full organizational capacity, the Qing Hanlin Academy retained 119 people, about half of whom were office clerks.

Most of the Ming and Qing Hanlin scholars came from the top three tiers (jia) of the jinshi degree holders. The first tier automatically became Hanlin senior (xiuzhuan) and junior (bianxiu) compilers, and the second and third tiers, if qualified after an additional examination, were accepted as Hanlin trainees (shujishi) for future appointments. As expected, powerful officials, such as the Ming grand secretaries (Neige daxueshi), the privileged Qing “serving personnel” (xingzou) of the imperial Southern Study (Nanshufang), or the Qing grand councilors (junji dachen), were always chosen from Hanlin academicians.

Yamin XU

Li Bai (701–762) was one of the most famous Daoist poets of the Hanlin Academy. He is said to have died while drunkenly seeking to touch the moon’s reflection in a lake.
Ancient Air
A poem by Li Bai, one of the most famous Daoist poets of the Hanlin Academy.

Climb high gaze four seas
Heaven earth how vast
Frost blanket crowd thing autumn
Wind blow big desert cold
Magnificent east flow water
10,000 thing all billow
White sun cover elapse brilliance
Float cloud without certain end
Wutong nest swallow sparrow
Thorn jujube perch yuan luan
Moreover again return go come
Sword sing travel road difficult
I climb up high and look on the four seas,
Heaven and earth spreading out so far.
Frost blankets all the stuff of autumn,
The wind blows with the great desert’s cold.
The eastward-flowing water is immense,
All the ten thousand things billow.
The white sun’s passing brightness fades,
Floating clouds seem to have no end.
Swallows and sparrows nest in the wutong tree,
Yuan and luan birds perch among jujube thorns.
Now it’s time to head on back again,
I flick my sword and sing Taking the Hard Road.

Harbin

Harbin is the capital city of Heilongjiang Province in northeastern China. The cosmopolitan city, known as Little Moscow, was once a haven for refugees from Russia after the Bolshevik Revolution of 1917, and is now famous worldwide for its winter Ice and Snow Festival.

Harbin is the capital of Heilongjiang Province in northeastern China. Its administrative region covers eight districts and eleven counties with a total area of 53,000 square kilometers. Harbin is the political, economic, cultural, educational, and transportation center of the province and (as of 2007) is the eighth largest city in China.

Harbin's winter is as long as five months and overnight low temperatures can fall to 40° C. Although summer is hot and short, the cool evening breezes from the Songhua River make Harbin one of the most popular retreats in July and August.

Originally a quiet fishing village on the south bank of the Songhua, Harbin derives its name from Alejin, the Manchu word for "honor" and "fame." During the twentieth century this village with a population of only 2,300 grew into a metropolis of nearly 4 million people by 2001, before more than doubling in population over the next six years. The city's rapid expansion during the twentieth century was precipitated by construction of the China Eastern Railway through Manchuria by the Russians at the end of the nineteenth and the beginning of the twentieth century. After the Bolshevik Revolution of 1917 the city became a haven for refugees from Russia, many of them Jews. In fact, during the first half of the twentieth century Jews in Harbin numbered more than twenty thousand—one of the largest Jewish communities in China. By the 1930s, Harbin's Jews had begun to scatter across eastern Asia because of economic crises and persecution by the Soviet army. After World War II many Harbin Jews moved away, mostly to Israel, the United States, Europe, or Australia.

During the period of the Japanese-dominated state of Manchukou (1932–1945), Harbin was the site of a notorious Japanese biological warfare laboratory. Soviet troops occupied the city in 1945, and a year later Chinese Communist forces took it over. From 1946 to 1949 Harbin was
used as military base by the Chinese Communist Party. The city played an important role in the Chinese Communist victory in northeastern China.

Since 1949, the founding of the People’s Republic of China, Harbin has grown into an integrated city with industry as the principal part of its economy. Hosting large and medium-sized state-owned enterprises, Harbin had been an important industrial base of China from the 1950s to the 1980s. Hydroelectricity equipment, airplane engines, and linen textiles were the main products. Since the 1978 economic reform Harbin has diversified its economy by developing light industry and service industry.

One of the most beautiful cities in China, Harbin is known as “Little Moscow” and “Paris in the East” because of its European-style architecture and its people’s daring way of dressing, the result of colonialism and cooperation with nearby Russia. Harbin, one of the few cities in China that never had a city wall, is famed for its cosmopolitan and open attitude toward things that are new and foreign. The local language is considerably influenced by the Manchu and Russian languages.

Health Care System

Quánkē yīxué 全科医学

Political, social, and economic changes since the establishment of the People’s Republic of China have created a continued challenge to provide medical care for 1.33 billion people in both urban and rural populations. As reforms made in response to the 2003 SARS epidemic have begun to show their efficacy, the government recognizes the need to rein in costs and address public concerns over quality of health care.

Modern China’s health care system has undergone substantial change in conjunction with the country’s political, economic, and demographic change. The rapid economic growth since the 1980s and changes in living conditions, nutrition, and health have resulted in decreased infant mortality (estimated at 21.16 deaths per 1,000 births in 2008) and increased life expectancy (estimated at 73.18 years in 2008).

China faces huge health problems, however, including a lack of access to affordable health care, often-inadequate medical insurance coverage, and an inequality in health services between urban and rural areas. As it has in the past when health concerns have caused great discontent among its populace, China’s government has proposed reforms to provide safe, effective, convenient, and affordable health care to both urban and rural populations.

Development of Health Care in People’s Republic of China

When the Communists established the People’s Republic of China in 1949, the country’s health and health systems had been weakened both by the civil war and by China’s war with Japan. In the period from 1949 to 1965, the government took steps to improve the nation’s health, emphasizing preventive measures. A three-tiered health care delivery system was implemented. At the lowest level, rural, village, or urban street clinics provided basic prevention and cure. Township or community health centers provided care for patients who needed additional treatment. Specialized services, unavailable at either of the two lower levels, were provided through a network of government-funded hospitals. The government established basic insurance systems for urban workers. The Government Insurance Scheme, or GIS, covered active and retired government employees, disabled veterans, and university staff and students. The Labor Insurance Scheme, or LIS, was funded by state-owned enterprises for their employees. The commune-based Cooperative Medical System, with village and town clinics, was developed in rural areas. New medical schools were established. Famine during the Great Leap Forward (the period in the late 1950s when farm workers were mobilized to work in factories and crops failed to be harvested) was a disaster in which up to 30 million people starved to death. But improved sanitation, water quality, and nutrition contributed to overall improved health during the period before the Cultural Revolution. For example,
schistosomiasis, a parasitic disease from infected water, was virtually eradicated.

Many of these health-care-system improvements were lost during the social upheaval of the Cultural Revolution (1966–1976). Medical schools were closed for five years, and their students and faculties were sent to the countryside. Treatment, specifically psychiatric treatment, favored political re-education over drug therapy. In rural areas, where up to 80 percent of the population lived, basic health care was provided by the “barefoot doctors.” These peasant youth received three- to six-month training courses that included traditional Chinese medicines and procedures (such as acupuncture) in addition to Western medical practices. The barefoot doctors continued farming work in the fields while providing first aid, immunizations, and health education. In 1986, there were an estimated 1 million barefoot doctors. Chen Zhou, appointed China’s Minister of Health in 2007, began his medical career as a barefoot doctor.

Rapid economic growth, decentralization of political and economic power, and a shift to a market economy characterized the thirteen years immediately following the end of the Cultural Revolution. Decentralization of government financial responsibility to provinces resulted in an inequity of health care between rich and poor areas. The percentage of health care services that the government subsidized declined, and financing of health care was increasingly privatized. A government-mandated price cap on some drugs led to increased use of expensive drugs and diagnostic technology (such as MRIs and CAT scans) to increase revenues for privatized large hospitals. The increasing costs had to be borne by consumers on a pay-as-you-go-approach that often forced people to forego treatment. Changes to the rural Cooperative Medical System resulted in fee-for-service treatment by often undertrained village doctors. Gaps appeared in medical insurance coverage. Industrialization resulted in the creation of many urban migrant workers who lacked health coverage, and the increasing numbers of people employed in the private sector were not covered by GIS or LIS plans. A positive step during this period was the undertaking of new public health initiatives that decreased the incidence of infectious diseases and infant mortality.

The period from 1990 to 2002 saw government efforts to rein in health care costs. Resistance by large hospitals and drug companies, plus the inability of poor provinces to implement centralized changes, largely resulted in the failure of these reform efforts. The number of private health care providers increased. GIS and LIS, which covered formal public sector employees, collapsed as insurance became a burden for businesses. A new program for urban uninsured, merging GIS and LIS into the Basic Health Insurance Scheme (BHIS), was implemented. This new plan is employment based: both employers and employees make contributions to a common fund. This period saw an increase in the incidence of sexually transmitted diseases, HIV, hepatitis B, and schistosomiasis.

The SARS epidemic of 2002 and 2003 brought the world’s attention to the inequities and infrastructure...
weakness in China’s health care system. Reforms inspired by this crisis included partial resumption of central management of public health and reallocation of funds. A new rural Cooperative Medical System, operated by county governments and funded by beneficiaries, counties, and the central government, was formed. As of September 2007, around 80 percent of the whole rural population of China had signed up (about 685 million people). One consumer weakness in the Cooperative Medical System is that benefits are provided on a sliding scale: The program pays a lower percentage of fees for treatment in urban areas, with patient responsible for the balance, but patients must often go to urban areas for specialized treatment. The numbers of people with health insurance seems to have increased significantly in 2007. A total of 220.51 million people participated in the urban Basic Health Insurance Scheme; a significant portion of the increase is due to the inclusion of migrant workers coming from the rural areas. The Chinese Center for Disease Control and Prevention was organized; the renewed reduction in infectious diseases since its inception shows its efficacy. Health care response to the Sichuan earthquake of 2008 was another indication of a strengthened system.

Strategies for Reform

Even after reforms that responded to the SARS (severe acute respiratory syndrome) outbreak of 2003, many challenges remain, including soaring medical costs, a lack of access to affordable medical services, antagonism between health-care providers and patients, and low medical insurance coverage. New reforms of the health care system, proposed in late 2008 and passed by the State Council in January 2009, attempt to address these problems. The goal is to provide universal medical services that are safe, effective, convenient, and affordable to both urban and rural populations. The plan promises to spend RMB¥850 billion by 2011 (approximately US $124.4 billion) to provide a universal primary medical service to the country’s 1.33 billion people. There are five key strategies in the plan.

The first key proposal is to increase the amount of urban and rural population covered by the urban Basic Health Insurance Scheme or the new rural Cooperative Medical System to at least 90 percent by 2011. Each person covered by the systems would receive an annual subsidy of 120 yuan (approximately US $17.50) beginning in 2010. Currently, farmers and their families and unemployed urban workers must pay for health care. Responding to a concern that the goal should be 100 percent insurance coverage, Li Ling, a professor at the National School of Development at Beijing University who developed the draft of the new plan, said that even developed countries can’t achieve 100 percent coverage.

The second key proposal is to build a basic medicine system that includes a catalogue of necessary drugs produced and distributed under government control and supervision starting from this year. All medicine included would be covered by medical insurance, and a special administration for the system with strengthened government control over drug production and distribution would be established. Medications represent more than half of health care costs for consumers, and the high cost is often a point of contention between health-care givers and patients. Opposition to this proposal comes from pharmaceutical companies, who say going back to a planned and controlled economy would result in lower productivity and that lowering drug prices may reduce drug quality.

The plan proposes to implement reforms to improve services in public hospitals. Increased government subsidies would partially offset reduced revenues from drug sales. A pilot program running from 2009 to 2011 would reform public hospitals in terms of their administration, operation, and supervision in order to improve the quality of their services. The government will select public hospitals in several cities to participate in the pilot program. Li Ling said that reform of public hospitals lies at the heart of the new plan.

A fourth strategy is to improve services of grassroots medical institutions, especially hospitals at provincial levels, township clinics or those in remote villages, and community health centers in less developed cities.

The final key proposal addresses inequality in delivery of health services. According to the United Nations, in 2005, 25 percent of public-health resources were devoted to rural residents, even though they made up roughly 60 percent of the population. China would gradually provide equal public health services in both rural and urban areas in the country.

Reforms are designed to address public concerns about the cost and quality of health care. The government describes the reforms as “putting people first,” but plan proponents expect additional benefits to China’s overall economy. Out-of-pocket health expenditures by individuals are one factor in the increased poverty rate in China (16.2 percent...
in 2006). With lowered costs for health care, people would have more money to spend on consumer goods. It is hoped that increased domestic consumption would result in less reliance on exports for economic growth. As was seen with the SARS epidemic, improved public health in China has implications for global health care.

Traditionally, Chinese food was healthy, mainly because millennia of famine led people to learn by trial and error how to eat to survive. But the Chinese diet has changed with modernization, as more fats and sugars have become available. Traditional nutritional medicine worked well to remedy certain deficiencies, despite being based on concepts very different from those accepted today.

Food has always been integral not only to the health but also to the culture of the Chinese people. China’s traditional diet was adapted to scarcity. Before the mid-twentieth century, China suffered famine in some part of the country almost every year, and a major famine every two to four years. Malnutrition and starvation were the commonest causes of death. Enormous developments in food production took place but were counterbalanced by rising populations and by environmental decline from deforestation, cultivation of marginal lands, and similar processes that led to erosion and drought–flood cycles. The people adjusted by eating a diet that maximized the amount of nutrients produced per acre.

Most nutrients came from the humble, often despised everyday grains and greens. Grain staples provided the most calories and nutrients. Where possible wheat and millet, more nutritious grains, dominated. Rice is less nutritious but yields far more crop per acre, thus it became the choice in places where it could grow well. Soybeans, another prevalent

A little girl takes a bite from a sandwich. Nutrition and food safety in China have become an international issue since it was discovered that melamine was added to Chinese milk and infant formula to artificially increase its protein levels. The chemical caused the poisoning of many Chinese children and contaminated many foods exported from China. Photo by Joan Lebold Cohen.
crop, yield high amounts of protein. Common vegetables such as Chinese cabbages, beans, and spinach are particularly rich in vitamins and minerals. The few animal protein sources—usually pork, chicken, and fish—were particularly economical to raise or catch and a rich source of protein and vitamins. Chinese women traditionally breastfed for a long time, sometimes three years, though usually half of that. Virtually all people lose the ability to digest lactose (milk sugar) after early childhood. This, along with the lack of pastureland and ancient conflicts with herding peoples, explains the lack of dairy products in the Chinese diet. In the West fermented dairy products are common. The lactose turns to lactic acid and is thus safely consumed.

Medical works from the Han dynasty (206 BCE–220 CE) show that the Chinese learned how certain foods corrected problems we now recognize as vitamin and mineral deficiencies. Watercress cured scurvy. Fresh foods and whole grains and beans cured beriberi. Red meats, especially iron-rich wild meats and liver, cured anemia. Goji (Lyccium chinense) leaves and berries produced strength, vigor, and general health. We now know they are extremely rich in key vitamins and minerals and are, in fact, a vitamin-mineral supplement. They were, and are, used especially for women recovering from childbirth. Many spices have both mineral value and antiseptic action and were used to preserve food and improve its nutritional value. Diarrhea was effectively treated with broth in which fresh foods were cooked, an early oral rehydration therapy.

In the low-meat diets of ordinary people, lack of vitamin B12 was a special problem. B12 occurs only in animal and fungal foods. The solution was soy sauce and other soy and grain products fermented by yeasts and fungi. Early Chinese, though ignorant of vitamin B12, found that such products complemented other foods and helped survival. Also important was bean curd (tofu). It provides not only protein but also vital calcium because it is usually coagulated with calcium salts.

Anyone with the means to survive could at least have a healthful diet. Studies by Cornell University in the 1980s and 1990s showed that Chinese living in traditional rural conditions had low levels of cholesterol (average of 127 vs. above 200 in the contemporary United States); were lean and in good shape; and had low rates of heart disease, certain cancers, and circulatory and degenerative ailments. Some areas, however, showed high rates of cancer, possibly because of extremely low cholesterol levels.

The situation has changed in recent years. Meat, fat, and sugar have become more available. People prefer them to bean curd, vegetables, and unprocessed grain. The result has been a rapid increase in obesity, heart disease, and diabetes. Problems for the future also include specific deficiencies. Folic acid deficiency is an emergent danger because of the decline in vegetable and whole grains consumption. Folic acid deficiency is a major cause of birth defects around the world and may be increasing in China.

Traditional beliefs about food and health centered on ideas of yin (cool, dark, soft) and yang (warm, bright, assertive). Foods were categorized in various ways within this system. Early on the ancient Greek system of humoral medicine reached China. It was known in the sixth and seventh centuries as still a rather exotic system. It fused with the yin–yang system and other Chinese nutritional knowledge. Foods were categorized as heating, cooling, wetting, or drying. Only heating and cooling remained important. In general, “heating foods” were high calorie and thus, literally, heating—calories are a measure of heat energy. “Heating foods” were generally prepared over high heat and frequently oily, spicy, or strong flavored. Examples are fatty meats, strong alcohol, fried and baked foods, and spicy foods. Some foods were regarded as “heating” only because they were of “hot” colors, red and orange. “Cooling foods” were low calorie, sour or astringent, cool colored, and bland: greens and other vegetable foods. Rice, noodles, and similar staples and moderate-calorie foods were balanced, at the midpoint between heating and cooling.

This system generally worked well because conditions such as scurvy and indigestion were considered hot and effectively treated with fresh vegetables. Anemia, tuberculosis, and general debility were cold and effectively treated with a diet of red meats, spices, and high-nutrient foods in general. Some “cooling foods” are also cleansing, helping the body to get rid of toxins or simply making one feel better by improving digestion and metabolism. The system did not always work, but it worked often enough to keep it valuable and functional up to the present.

Another system was the consumption of “strengthening (bu) foods,” considered to build body, blood, and vigor. These are easily digestible, mineral-rich protein foods, ranging from game meats and mushrooms to pine seeds and edible birds’ nests (from the swift, Collocalia esculenta). These do indeed have nutritional value.
Unfortunately for biodiversity, a less valuable belief arose that any strong, sexually potent, or strange-looking animal had special magical powers and could transfer them to the eater. Dozens of species of wildlife are now disappearing because of this belief, which, unlike so much of Chinese traditional nutrition, has been disproved by modern biomedicine. A less formal but widespread concept that does not stand up well is the folk idea that red liquids build blood, brain-shaped foods (like walnuts) build brain cells, and similar associations.

To this may be added the thousands of medicinal herbs and products recognized in traditional Chinese medicine. Many of these fail modern tests, but others are useful and have become worldwide remedies. The boundary between food and medicine has never existed in China. Foods are eaten for health, and herbal medicines are incorporated into gourmet dishes.

Chinese medicinal food has spread to the Western world through books, Chinese clinics, and medicinal-food restaurants. In China itself restaurants serving yaoshan—“medical dining,” traditional medicinal dishes—have been growing in number and elaborateness since their beginning around 1980 in Sichuan. They serve updated recipes based on the medical-nutrition classics.

Various animals are considered healthy, but for different reasons. Here the head and legs of an alligator are for sale in a restaurant in Guangzhou.
The Tiandihui (Heaven and Earth Society) was one of several voluntary associations that came into being during the Qing dynasty (1644–1912), but its origins and raison d’être have been a subject of ongoing debate among scholars. Some regard it as a mutual aid organization formed by China’s lower classes; others see it as a political order founded by Ming loyalists to overthrow the Qing.

Heaven and Earth Society, also known as Tiandihui (TDH), was one of several voluntary associations or brotherhoods, characterized by ceremonial initiation rituals in the form of blood oaths, which appeared during the Qing dynasty (1644–1912). These associations, or hui, were organized for a variety of purposes. Understanding their true nature and tracking them through time and space have challenged those who have come into contact with them. Often, in the absence of real information, they have become a tabula rasa onto which different groups have imprinted differing understandings of their origins and purpose. Today, the TDH’s origin is still a subject of dispute by scholars, who regard it as either a mutual aid or Ming Loyalist organization.

The mutual aid view, made possible by the recent opening of Qing dynasty archives in both Beijing and Taiwan, suggests that the TDH emerged around 1762, in Fujian Province, in response to the demographic and economic crises of the late eighteenth century. Founded by an itinerant monk, it subsequently took shape as a multi-surname fraternity, transmitted throughout southern China by an emigrant society for the purpose of creating, through rituals of sworn brotherhood, pseudo-kinship groups to provide sojourners, cut off from the social safety net of their families, with a means of mutual interaction. Once formed, these societies figured in the survival strategies of China’s lowest classes in ways that combined protection and predation. While the rank and file, on learning secrets in the form of passwords and coded behavior, obtained immediate brotherhood, their leaders quickly learned to profit from the selling of membership and to mobilize their units for everything from robbery to feuding to occasional rebellion.

This view of the society as a product of China’s eighteenth-century demography stands in marked contrast to that of the Ming Loyalist scholars, who saw it as a product of China’s seventeenth-century politics, the goal of which was to overthrow the alien Qing dynasty in the hope of restoring the defeated Ming dynasty (1368–1644). The story embedded in the society’s creation myth recounts how once-loyal monks of the Shaolin monastery, after rendering aid to the throne, were betrayed by the Qing and subsequently sought revenge against them through the founding of the society, which they dedicated to the dynasty’s overthrow; Ming Loyalist scholars thus tend to view the society as having been created by Zheng Chenggong (Koxinga) or other loyalists of the seventeenth century for the purpose of overthrowing the Qing. Throughout the nineteenth and twentieth centuries, society materials, in the form of manuals, registers, and insignia, unearthed in China and Southeast Asia,
gave rise to disputes among them about the meaning of the legend and the historical counterparts of its fictional characters.

To complicate matters even more, Westerners, especially colonial officials of the nineteenth century, imbued with a consciousness of fraternal orders and clandestine organizations, regarded the TDH as a Chinese secret society—the term *Triads* eventually came into use to refer to such secret groups, and is often used throughout Asia today as a synonym for the TDH in general—and preoccupied themselves with discussions of whether it shared a common origin with the Freemasons and other European mystery cults.

Qing officials, immediately perceiving the TDH as a threat to society, condemned it in 1792 as a rebellious order and engaged in repeated witch hunts against alleged members, thereby giving rise to self-fulfilling prophecies, as members, squeezed by persecution, had little choice but to rise up, which they did repeatedly, especially in conjunction with the Taiping Rebellion and the 1911 revolution.

Members also responded to government persecution by going undercover and changing the organization’s name so that, depending on locality, the TDH could be also known as the Three Dot Society, the Three Unities Society, and the Hong League. Despite Communist efforts to suppress it during the 1950s and 1960s, today, known as Triads, the society is experiencing resurgence in the realm of worldwide Mafia and organized crime, with tentacles broadly extended throughout the global economy.

一步登天

Yì bù dēng tiān

Hebei Province ▶
Hebei is a northern province that surrounds the national capital, Beijing, and features the eastern extension of the Great Wall. It is about the size of the state of Nebraska. The province’s agriculture supplies Beijing with wheat, corn, vegetables, and fruit. In 1976 an earthquake devastated the eastern city of Tangshan.

Hebei (Ho-pei, Hopeh) Province in northern China covers an area of 190,000 square kilometers. It borders in the west on Shanxi Province, in the north on Inner Mongolia Autonomous Region and Liaoning Province, in the east on the Bohai Gulf—an arm of the Yellow Sea—and Shandong Province, and in the south on Henan Province. The province (not to be confused with Hubei Province in central China) surrounds the self-governed municipalities of Beijing and Beijing’s seaport, Tianjin. To the west the Taihang mountain range, with peaks up to 2,870 meters above sea level, forms a physical barrier between Hebei and Shanxi, and in the north the Yanshan range, rising to 1,500 meters, constitutes the traditional frontier between China and the nomads in the north. It is here that the eastern extension of the Great Wall is located. Southern Hebei, covering about 78,000 square kilometers, is part of the North China plain, most of which is lowlands less than 50 meters above sea level.

The province has a temperate, continental, monsoon climate. Winters are cold and dry, and in January temperatures may drop to –21° C in the north (a low of –42.9° C has been recorded). The climate is less cold in the south. The rainy season stretches from June through August, and temperatures in July average 18° to 27° C, but most regions have recorded temperatures above 40° C. The capital, Shijiazhuang (estimated 2007 population 9.55 million) is situated in the southern lowlands, which are also where the majority of Hebei’s people live.

Hebei is divided into 10 regions, 142 counties, and 2 autonomous counties between Beijing and Tianjin that are inhabited by the Hui Muslims, which is the largest minority group in the province. Manchu and Mongolian people also live in the northeast, but the Han Chinese make up 98 percent of the population. Traces of agriculture date back to 4000 BCE, but the marshy lowlands of southern Hebei were first drained and settled during the Han dynasty (206 BCE–220 CE), and for centuries this densely populated area was one of the most productive in the empire. During the Tang dynasty (618–907 CE) the area declined as the Yangzi (Chang) River valley was developed. Hebei was incorporated into a number of foreign dynasties, including the Liao (916–1125) and the Jurchen Jin (1125–1234). Beijing became the capital of the Yuan empire (1279–1368), and with brief interruptions Beijing has remained the capital of China.

The economy of Hebei Province has for centuries been dependent on Beijing, and the intensive agriculture in the lowlands has supplied the capital with wheat, corn, vegetables, and fruit. Light industry is distributed over the province, with major textile centers in Shijiazhuang (the provincial capital, with an estimated 2007 population of 9.55 million) and Handan (estimated 2007 population 8.96 million).

In 1976 a major earthquake (7.8 on the Richter scale)
devastated the city of Tangshan in eastern Hebei. The earthquake is considered to be the most devastating of the twentieth century. Estimates vary widely, but it is thought that as many as 750,000 people lost their lives. After a ten-year project the city was entirely rebuilt.

Heilongjiang Province, in the far northeast corner of the country, is named after its longest river, the Black Dragon River (known elsewhere as the Amur), and is nicknamed “the Great Northern Granary.” It borders on Inner Mongolia Autonomous Region to the west, Jilin Province to the south, and Russia to the north and east. It holds the record for the coldest recorded temperature in China (–52° C).

Lying in the northernmost part of northeast China, Heilongjiang Province has a total area of 469,000 square kilometers (about 181,000 square miles; approximately twice the size of Romania), of which 60 percent is mountains, 10 percent rivers, and 30 percent farmland. It has a common boundary with Inner Mongolia Autonomous Region and Jilin Province, and borders Russia to the north and east. Within its population are some 2 million people of minority nationalities, including Manchus, Koreans, Huis, Mongolians, Daurs, Hezhens, Oroqens, and Evenkis.

Heilongjiang has a cold-temperate continental climate with a mean annual temperature of –2° to 3° C (35° to 28° F), an ice-bound period of five to six months, and a frost-free period of 120 days. The city of Mohe, where it is possible to see the Northern Lights, has the record for the lowest temperature recorded in China: –52° C (–62° F). It has warm, rainy summers with an annual rainfall of 400 to 650 millimeters (about 15 to 26 inches) and long hours of sunshine, which is favorable for crop growth.

Named after its longest river, the Black Dragon River, known outside of China as the Amur, Heilongjiang has five large river systems made up of the Heilong, Songhua, Wusuli, Nenjiang, and Suifen rivers. Rivers and lakes provide good quality water resources for agriculture, industry, and human consumption. Heilongjiang has vast expanses of flatland and wide areas of fertile back soil and is one of China’s major commodity grain growers. It is nicknamed “the Great Northern Granary,” denoting its abundant production of soybeans, maize, millet, sorghum, sugar beets, flax, and sunflower seeds. Ginseng is cultivated in this area as well.

Heilongjiang’s land area also includes the country’s largest known oil reserve, the Daqing oil field, which was the site of huge protests in 2002 after the central government pressured the owner of the oil fields to cut back on some of the social benefits offered to its current and previous employees. The province also is rich in coal, gold, copper, aluminum, lead, zinc, silver, molybdenum, bismuth, and cobalt. Heilongjiang has a forest area of close to 210,000 square kilometers (about 81,000 square miles), or 49 percent of the province’s total area, and leads the country in timber reserves. The mountains and forests abound in alpine weasels, sables, otters, deer, and musk deer.

Heilongjiang has the most developed inland shipping among the northern provinces. Rail is the principal means of transport in Heilongjiang, with Harbin as
the general hub. Harbin, the provincial capital (with an estimated population of 9.87 million in 2007), is on the south bank of the Songhua River. It is the economic, cultural (Harbin is famous worldwide for its annual Winter Ice Festival), and communications center of the province and is the eighth largest in China. The city used to be called “Little Moscow” as a result of colonialism, cooperation with, and immigration from nearby Russia. Harbin looks a bit like a last outpost of imperial Russia.

Henan Province
Hénán shěng 河南省
93.6 million est. 2007 pop. 167,000 square km

Henan Province, in the north-central part of the country, is China’s most densely populated province. It is known as the cradle of Chinese civilization, with evidence pointing to its inhabitation during China’s Neolithic period (12,000–2,000 BCE). Several ancient imperial capital cities are located in the province, which is about the size of the state of Wisconsin but with approximately seventeen times the population.

Henan Province, in north-central China, covers an area of 167,000 square kilometers (64,000 square miles, slightly smaller than the state of Wisconsin). It is bordered by Hebei Province to the north, Shandong Province to the northeast, Shanxi Province to the northwest, Anhui Province to the southeast, Hubei Province to the south, and Shaanxi Province to the west. Henan has a population of more than 93 million and is China’s most densely populated province. The capital and largest city in the province is Zhenzhou, which was inhabited as far back as the Neolithic period, (12,000–2,000 BCE in China). Recent excavations have unearthed artifacts dating back to the Shang dynasty (1766–1045 BCE).

Henan is known as the cradle of Chinese civilization. Archeologists have found evidence that Henan was inhabited as far back as the Neolithic period, (12,000–2,000 BCE in China). Recent excavations have unearthed artifacts dating back to the Shang dynasty (1766–1045 BCE).

Several cities in Henan have been prominent in Chinese history. Anyang, in the north, was the first capital of the Shang dynasty. Luoyang, in the west, served as imperial capital of the Eastern Zhou dynasty (770–221 BCE). And Kaifeng, in the northeast, was the imperial capital during the Five Dynasties period (907–960 CE) and the Northern Song dynasty (960–1126 CE). The province is a major producer of wheat, tobacco, and cotton. Textile, electricity, and high-tech industries help drive the local economy. Zhenzhou, at the crossroad of several major railroad lines that transverse China, is one of the key points of China’s national transportation system. Within the city
are several important economic and high-tech development zones and a major export processing area.

Henan Province’s economy is not as open as other provinces and has had problems attracting foreign investment. Structural weaknesses, underdeveloped transportation links and a weak private sector contribute to Henan Province’s underdevelopment. The economy is dominated by agriculture, mining and manufacturing interests. Further complicating development is the concentration of the manufacturing sector in six industries: petrochemicals, food processing, nonferrous metals, automobiles, textiles and machinery. Even though Henan Province is a major railway transit hub, the province lacks the infrastructure to sustain economic growth.

Located in Yunnan Province in southwestern China, the sparsely populated Hengduan ranges are China’s longest and widest mountain system. Main sources of income are cattle, sheep, and forestry. The ranges also are a major tea producer. Most of the inhabitants belong to minority nationalities such as the Lisu, Yi, Bai, and Tibetans (Zang).

The Hengduan ranges in northwest Yunnan Province, extending into neighboring Tibet (Xizang) Autonomous Region and Sichuan Province, are China’s longest and widest mountain system. Several large rivers flowing from north to south—the Nu, Lancang, Yalon, and Jinsha—traverse the area. The river valleys are 1,500–2,000 meters above sea level, whereas peaks in the southern part reach 4,124 meters (Tiancang); Guangmao in the eastern part reaches 4,023 meters. The peaks stand close together, and the area is almost without plateaus and broad valleys.

The ranges have a relatively high annual precipitation of up to 2,500 millimeters on the western slopes of the mountains, whereas the eastern slopes receive markedly less rain—about 900 millimeters. The region is sparsely populated; most inhabitants belong to minority nationalities such as the Lisu, Yi, Bai, and Tibetans (Zang), and the majority of the region is divided into autonomous districts. The main city of the area is windswept Xiguan, situated at the southern end of Lake Erhai. Main sources of income are forestry, cattle, and sheep. Since tea plants were introduced in the nineteenth century, the region has become a major tea producer. The region is also one of China’s important nonferrous metal industrial bases.

High-Technology Sector

Since the late 1990s and especially since the start of the new millennium, China has surged forward in terms of economic development. It has also made significant advances in the high-technology sector, especially in the fast-growing Internet and mobile phone fields.

The Internet moved into the public domain in China in 1997 and exploded after 1999, when China’s Internet users reached a critical mass. At that point, many Internet companies were created, the largest of which were financed by venture capital (VC) from the United States. A new group of entrepreneurs emerged in Zhongguancun (ZGC), a district in Beijing that has come to be known as China’s Silicon Valley. These new entrepreneurs were returned from abroad with extensive contacts or experience overseas.

Though the Internet is a service industry requiring little manufacturing for export, the commercial strategies of Chinese entrepreneurs have been strikingly similar to those of the successful PC manufacturing companies, learning from the foreign companies while building on their own technical expertise and focusing on the domestic market. Neither the uncertainty of state regulation nor the initial hesitation of foreign investment has disturbed their focus. They have been heartened by the growth of China’s Internet market, which since the late 1990s has become the world’s second largest. In 2008, the number of China’s Internet users exceeds the United States to be the largest in the world. However, unlike in other high-tech sectors where foreign brands are the most prominent, China’s Internet landscape is dominated by local firms.

The Development of China’s Technology Market

According to China’s Ministry of Information Industry, during the 1990s, China’s information and communications technologies (ICT) market experienced growth rates that varied between 20 and 40 percent annually. By 2000, China’s ICT market was one of the most significant in the world. The booming Internet and mobile-phone industries, in particular, fueled this spectacular growth. The personal computer had been seen as a necessary tool for offices in the 1980s and early 1990s; the advent of the Internet brought the PC into the home as a source of mainstream media and home entertainment, vastly enlarging its appeal and consumer base. Rising incomes among urban households and ever-declining PC prices also contributed to the market’s growth.

The watershed year for China’s Internet industry was 1997. Before then, the country’s Internet development was mostly limited to infrastructure building among research institutes, universities, and state organizations. Only after 1997 did the Internet become widely available to the public. China’s first Internet café opened in Beijing in November 1996.

The first Internet user survey in China, which was
conducted in October 1997, showed there were 620,000 Internet users nationwide and less than 300,000 computers able to connect to the Internet, minuscule in a country of (then) 1.24 billion people. In comparison, in the same year, the United States had 54.6 million Internet users, and Japan had 8 million.

Since 1997, however, the number of Internet users has soared. Since 1999, there has also been a sharp rise in the number of Internet service providers. After 2001, China felt the chilling effects of the dot-com bubble bursting and the NASDAQ crash, and the number of domains stagnated for about two years. In late 2002, however, domain-name registration started to take off again. According to CNNIC, China official site for Internet statistics, China had 200 million Internet users by the end of 2007; by January 2009, with China’s population at 1.33 billion, the number of Internet users had risen to 298 million, ranking China first in both counts.

Beijing has remained the home of China’s main Internet service providers, accounting for about 19.1 percent of Internet domain registrations in China at the end of 2006. In contrast, Shanghai, with the highest GDP per capita in China, had 9.2 percent of the country’s domains, and Guangdong province (China’s most developed province) had 15.6 percent. Beijing’s predominance has largely to do with its concentration of educational and research institutions and its status as the national capital. Most national and international organizations and media are also located there. Access to information, regulators, and policy makers has also boosted Beijing’s central position in the Internet age.

Another important force in the development of China’s technology industry has been the rapid surge in mobile phone use. In the 1980s, mobile phones were a status symbol for newly rich businessmen or important officials who carried the expensive and bulky gadgets around. But the technology progressed, yielding ever more portable devices and lower prices. As prices declined and the network infrastructure improved, the number of subscribers skyrocketed. The lack of coverage of land phone lines and the expense of installation in China also made mobiles a logical option. By 2002, China had become the world’s largest mobile phone market. The rise of the mobile phone, in turn, has led to increased demand for a variety of telecommunication technologies and services—equipment, software, integrated-circuit designs for phones, as well as text messaging services, all of which have become converging points for the ICT sector.

As with Internet provision, Beijing is the center of China’s telecommunication industry and services. Unlike Internet services, which are dominated by non-state firms, the telecommunication sector is heavily regulated by the state and dominated by giant state-owned carriers. To be a part of the telecommunication industry, one has to win approval or favor from (or at least have good access to) the decision makers in Beijing, which makes the city a favorable location for this industry too. Ironically, while Beijing’s industrial power has long been diluted and surpassed by the booming southeast coast, the...
telecommunication age seems to be restoring its predominance as an industrial-communications center in the “new economy.”

The New Entrepreneurs

To understand the new high-tech environment in China, it is instructive to look at the entrepreneurs who were active in the late 1990s and early 2000s. Consider the story of three of the better-known of these entrepreneurs: Wang Zhidong 王志东 and Zhang Caoyang (张朝阳, Charles Zhang in English), and Robin Li 李宏彦, each is the founders of a key Internet company located in ZGC, and each represents a different characteristics of the sector development.

WANG ZHIDONG

Wang Zhidong was a legendary figure in ZGC and a long-time spiritual leader of China’s Internet industry. In the 1990s Wang was a software genius. Starting in his junior year at Peking University in the 1980s, Wang held part-time jobs at different ZGC companies, doing sales, software, and other work on the then-thriving “Electronic Street.” After he graduated from Peking University in computer science, he started to work on Windows-compatible Chinese-language word-processing software. His first original program, Chinese Star 中文之星, could cleverly convert Windows into a Chinese environment while maintaining its functions. Prior to Microsoft’s creation of a Chinese version of Windows, Wang’s program was the gold standard for Chinese word processing; most computers in China probably had it installed. But despite Chinese Star’s popularity, Wang did not become China’s Bill Gates: the company he founded to sell Chinese Star made little money due to the program’s high piracy rate.

In 1993, Wang left the company and founded another one, Stone Rich Site 四通利方, where he developed his more sophisticated Richwin software, and integrated Chinese into the emerging Internet environment. In 1995, Wang received a $7 million venture investment from a venture capitalist in California and he later merged his company with a Taiwan Internet portal, changed the name to Sina.com, and raised a more substantial sum of capital. Sina was approved to list its stock on the NASDAQ in 2000 and it is now China’s largest Internet portal.

Wang’s experience exemplifies the importance of ZGC as the cradle of China’s high-tech industry. Not only was there technological continuity in his move from his Chinese-language Windows platform to a Chinese Internet platform, but his fame from Chinese Star and Richwin—popularized through his work in ZGC companies—was the key in attracting the attention of foreign venture capital.

ZHANG CAOYANG

Zhang Caoyang, a graduate of China’s prestigious Tsinghua University, followed up his experience with graduate work at MIT, earning a PhD in physics. He was lured by the Internet boom in the United States in the mid-1990s and joined an Internet start-up created by a friend from Harvard. That job took him back to China in 1995, where he supplied the start-up with Chinese information online. Having no roots in China’s own high-tech industry, Zhang nevertheless understood its potential, and he decided to start his own Internet company. Unlike Wang, he did not even try to obtain state sponsorship but directed his capital search toward VC firms in the United States from the start. He received limited capital support at first from his friends and professors and was later able to win substantial VC investment.

Although Zhang’s Internet site, Sohu.com, initially was not as well known in China as Wang’s Sina.com, Zhang was much more accessible to people in the United States. He was listed as one of the fifty “digital heroes” of the world by Time magazine in 1998, and the fact that Zhang made the list increased his name recognition and the fame of his company enormously. He became an instant celebrity both in China and in Chinese student communities overseas. Sohu.com and Sina.com are the two most well-known Chinese Internet portals.

The story of Sohu.com thus had implications entirely different from that of Sina.com. Zhang’s success was due in large part to U.S. expertise and U.S. capital. It was a powerful enticement for many Chinese youth who were either studying or working in technology-related fields in the United States: They started to see that there could
be riches and fame in their future if they brought their technological and business expertise and U.S. connections back to China.

One of the people inspired by Zhang’s example is Robin Li (Hongyan 李宏彦). Li graduated from Peking University, much later than Wang, in 1991. As did Zhang, he headed to the United States for graduate education in the computer sciences. Before he finished his PhD through State University of New York, Buffalo, he landed a string of internship or jobs at a number of Japanese and American corporations in the United States. Li made a breakthrough in Internet search-engine technology during his work, and he was recruited into Infoseek—the once leading Internet company—to be responsible for its search engine development. In the white-hot Internet bubble of the late 1990s, Li decided to start his own company and was able to raise US$1.2 million venture investment (Barboza 2006). He went back to Beijing in 1999, rented a space in a hotel next to his alma mater and named his company Baidu.com. The name came from a famous phrase in a classic Song dynasty poem, describing the desperate search for a beauty in the crowd, only to find her under a light when you suddenly turn around. Baidu struggled in China for a few years due to the immature Internet industry, but was able to climb steadily to the most favored search site after 2003. It achieved international fame in August 2005 when it issued an initial public offering on NASDAQ. Known as “Chinese Google,” the share price of Baidu more than quadrupled on the first day, setting a record for first-day performance among foreign firms ever listed on the U.S. stock market, and among all firms in the previous five years.

These three examples show how dynamic China’s Internet development has been at the turn of the century. All three persons show strong linkages with U.S. in capital and business models, but specialize in different areas.

Visitors at the Shanghai Industrial Exhibit. PHOTO BY JOAN LEBOLD COHEN.
The new entrepreneurs emulated the Western business model and Western professionalism, which were rather alien to the first generation of Chinese entrepreneurs. In fact, they are so familiar with U.S. entrepreneurs that they are often accused of simply being copycats who transplanted U.S. models to Chinese soil, only to find out later that Chinese soil is quite different.

Online retail companies had to sell to a public that seldom use credit cards, and there was no giant Western-style, reliable delivery system in place; information providers had to work around the state monopoly on information and censorship; and software makers had to live with the high rate of piracy, to name just a few obstacles. Given all these difficulties, it is no wonder that foreign Internet giants were not interested in China before 2002. Only the local firms had the perseverance, skills, and connections to survive during the cold spell.

Yet being local also brings other benefits. The Internet is highly consumer driven, so local knowledge, access, and expertise offer tremendous advantage. Take the example of Internet search engines. Google is the undisputed global leader, with over half of the global market share, but it only ranks third in the Chinese market, after Baidu.com (the leading Chinese search engine) and a more localized Chinese Yahoo. Many in the West blame the result on Chinese government censorship, which reduces Google’s speed in China. But a large number of Chinese do use Google, so the speed must have been tolerable. Other factors might be more influential. The marketing director of Baidu suggests that Baidu’s knowledge of the...
habits and preference of Chinese users, the resources it dedicates to Chinese language searches, and its efforts to build Chinese online communities are among its main advantages over Google. Baidu is not alone; in China’s Internet industry, local firms are the market leaders in virtually all fields, and by high margins. This cannot be an accident. Nor can it be attributed solely to the manipulation of the Chinese government, as similar patterns of local firm dominance on the Internet are also found in Japan and South Korea.

Those local firms who survived the early 2000s eventually experienced another boost from 2003 to 2005, when the share prices of China’s dot-coms surged again on the NASDAQ due to profits in text messaging services and online games, both of which seem to enjoy a level of popularity in China unmatched in the United States. Other large international dot-coms such as eBay, Amazon, and Monster rushed to purchase local dot-coms as a way to enter the Chinese market, but by then Chinese firms were already well established China, which made competing with them more difficult and costly for the multinationals.

**Broader Growth in High-Tech Sectors**

The development of the Internet led to broader growth in the high-tech sectors. For example, the subsequent development of e-business and e-government led to a sharp increase in demand for enterprise-level management software, where piracy is much less likely than consumer-oriented software. Combining their computer hardware trading experience and software expertise, many ZGC firms created thriving businesses providing organizations with systems integration, network solutions, and applied software. Unlike the software industry in India, which is primarily oriented toward outsourcing in the United States and European markets, China’s software industry is domestically oriented, so it is the domestic demand that defines the industry.

Take the example of China’s largest private software company, UFIDA 用友. In 2005 it claimed to have the largest market share of enterprise software in China. It first got started because differences in the accounting systems of China and the Western world made imported accounting software hard to use in China. Enterprise management software of foreign origin also suffered a very high failure rate in its application in Chinese enterprises—over 80 or 90 percent—and imported software was far too expensive for all but the largest Chinese enterprises. UFIDA focused its attention on small and medium-sized firms. It and its “twin,” Kingdee Software 金蝶 in Shenzhen, dominate China’s small-firm market for enterprise management software.

Even though the Internet bubble burst in the spring of 2000 in NASDAQ, the returning flow of Chinese students to Beijing after that year actually intensified the industry. The Chinese central government and local governments became increasingly active in recruiting overseas talents through organized publicity tours in the United States, and by giving tours in high-tech regions in China, and in others areas. Some local governments, such as the administrative committee of Beijing’s ZGC Science Park, also set up permanent offices in Silicon Valley, California, and a few other locations in order to recruit high-tech professionals for entrepreneurial ventures in Beijing. Limited grants and various programs of capital assistance for enterprises gradually became available, attracting returnees to high-tech zones across China. All these efforts, adding fuel to China’s sustained economic growth since 1980, finally created a growing flow of returnees in 2002. Although salaries in mainland China for highly-skilled professionals are still low in comparison to their U.S. counterparts, the much lower cost of living in China affords these professionals a comfortable, luxurious lifestyle that they could not afford in developed countries.

According to the Yearbook of the Ministry of Education, the number of mainland Chinese returnees has increased significantly since 2002. Overall, about a quarter of students who went abroad beginning in 1978 have returned to China at mid 2000s. Major science parks in large Chinese metropolitan areas such as Beijing, Shanghai and Shenzhen have attracted the lion’s share of returnee entrepreneurs in the high-tech sectors. The vast majority of these enterprises are very small and undercapitalized at the moment. Together, however, they constitute an indispensable force in the internationalization of the ZGC business environment and in the creation of an industrial ecosystem that allows larger and more technologically sophisticated companies to emerge or survive. The returnee
firms are particularly active in the highly sophisticated technological or capital sector such as Internet, semiconductor design, software outsourcing, cell phone development, and venture capital fund.

**Learning the Power of Capital**

The Internet boom opened Chinese businessmen’s eyes to the concept of venture capital and stock market options and prompted many to consider the various capital tools available to overcome their inherited disadvantage in the state-owned financial sector. Looking at the NASDAQ model, many small and medium-size non-state companies hoped to gain the opportunity to use the stock market option without having to go through the cumbersome procedures that came with overt state involvement. A proposal was made in 2000 to establish China’s own NASDAQ to focus on smaller and high-tech companies. The so-called Chinese NASDAQ, which was established in 2004 in Shenzhen, focuses on small and medium-size companies, but without a high-tech focus. Raising capital on the stock market is still not a viable option for most small Chinese firms. The door is opening wider, however, and more and more private companies are taking advantage of the stock markets in China, Hong Kong, and the United States. According to the statistics of the ZGC administrative committee, by 2006, 85 ZGC firms were listed on stock markets, mostly in Hong Kong and China, though thirty-six were listed abroad.

In order to trade publicly, ZGC firms had to adopt a more formal, Western business model, which led, after 2000, to a flurry of restructuring schemes in Chinese firms and to quite an array of mergers and acquisitions. Managers with foreign business backgrounds—the so-called astronauts—were hired and fired at a rapid pace to accomplish that restructuring.

**The Chinese Market, the Internet, and Beyond**

From 1983 to the first decade of the twenty-first century, China’s ICT industry shifted decisively away from the insular socialist model toward a market-driven model open to international involvement. As the size and diversity of China’s market grew, more opportunities arose for both domestic and foreign enterprises. State regulation, market demands, technical capacity, and infrastructure are changing fast in China. Such changes require much keener understanding of the situation and a high dose of tolerance for uncertainty, which means that domestic firms have ended up doing better than large multinationals.

China’s ICT market is now one of the largest in the world. The Internet and wireless communication booms have diversified the ZGC’s industrial structure and provided platforms for an array of software firms, other service companies, and hardware firms. Nonstate high-tech enterprises have been legitimized and become the mainstay of China’s ICT industry. A new generation of entrepreneurs with a strong global orientation has emerged. Multinational corporations are increasing their investments and local involvement. The state, after years of standing off to the side, has designated ZGC as a center of innovation.

The returnee enterprises, in particular, are a rising force in many of China’s high-tech areas. They are significant because of their transnational experiences, their connections to overseas business, and their local links to universities and domestic enterprises. They occupy a uniquely favorable position in the innovation system in China. Like foreign multinational corporations, they maintain ongoing technological, capital, and market connections with the global technology centers, but unlike large foreign companies, they are well integrated into the research and business communities in China. Their access to overseas resources and markets gives them distinct advantages over homegrown firms in accumulating technology and raising capital, though they must make considerable cultural and business adjustments, and not all of them will fulfill their ambitions. While the number of returnee-founded enterprises has grown rapidly since 2000, as a whole they are still small and vulnerable. The capability of the Chinese market to absorb advanced products is limited, and the returnee enterprises constantly face capital shortages due to China’s undeveloped capital market for private businesses.

The Chinese government has been encouraging the returnees by granting them limited political and financial support. But the perceived favorable treatment for returnees may also backfire if they generate resentment
and jealousy among homegrown entrepreneurs. For the returnees to truly perform their services, China must have an infrastructure conducive to fostering productive links with the local business culture, such as information transparency and highly developed professional services. In the end, public policies that increase the flow of information, provide a fair and transparent legal structure, and strengthen the capital market and business services are critical for all enterprises in China. But they may be more important for returnee-founded enterprises, as these enterprises are more sensitive to the commercial infrastructure of the region.

Since 2003, the Chinese government has put increasing emphasis on indigenous innovation. Attracting overseas returnees is one way to promote it. China is also pursuing technological standards that would be alternatives to the established ones of the West. Establishing a technology standard is the ultimate prize, one that will encourage future technology innovation. Those companies responsible for establishing the mainstream global standards enjoy significant commercial rewards from the market. China’s effort for defining its own technical standards is controversial both internationally and nationally, since some observers see it as a proof of China’s pursuit of ethno-nationalism policies.

Overall, China’s institutional structure still need further reform for entrepreneurial ventures to succeed in a significant ways. China still lacks a stable financial infrastructure that supports innovation, so most start-ups have gone overseas in their search for capital. More important, as the Chinese market grows increasingly sophisticated, far more coordination and collaboration is necessary among firms in such diverse areas as design, consulting, research and development, software, services, and manufacturing. In other words, a few vertically integrated companies are no longer sufficient for the ICT industry; close networking between many different types of companies is necessary. It will be worth watching to see how the industry—and ZGC—will develop in the years to come.

Historical geography is the study of how cultural features of various societies emerged and evolved; it necessarily involves the analysis and compilation of historical treatises that documented the evolution of a society—its administration, infrastructure, and the events that shaped its history. Until the twentieth century Chinese historical geography was slow to develop as a formal field, but it has roots in a discipline well explored in Chinese scholarship: the “geography of administrative change,” or “dynastic geography.”

The two Chinese characters that translate the English word geography (di and li) literally mean “land” and “inherent order.” The word “dili” appeared in Chinese literature no later than the fifth century BCE. “Lishi dili” in the Chinese language describes historical geography. In traditional China, history was an essential branch of official scholarship and historical geography was considered the essential basis for all social knowledge. In fact, China’s first modern historical geographers were students of history, not of geography. As they tried to develop the field of historical geography into an independent, professional, and rigorous discipline, history students began to recognize its profoundly geographical nature. As a result, they began to develop a “geographical mind” to improve the caliber of their research. Historical geography has come to play an important role in the study of the long history of China. Chinese historical geography has two important influences—the critical inheritance of traditional scholarship and the influence of Western ideas.

Yange Dili

Confucian scholars invented the concept of chronological geography, which reached its zenith during the Qing dynasty (1644–1912). Chronological geography was the reconstruction of historical treatises compiled by past dynasties; the development of such a systematically arranged geographical order over the years bolstered the imperial ideology. Special attention was paid to chronological descriptions of changing administrative systems, road networks, and water systems, and to the verification of the locations of key historical events and settlements. Because chronological geography (or yange dili, the “geography of administrative change”), is based on the history of each Chinese dynasty, some scholars refer to it as the “dynastic geography” stage of Chinese historical geography.

The ideas of Confucian geography were derived from two major historical literatures: the intentional geographical writings and the unintentional geographical writings. The former contains dozens of official dili zhi, treatises on geography, in the standard dynastic histories. The latter contains the interpretation of ideas of geography from philosophical or religious writings. Of three main philosophical schools in Chinese history (Confucianism, Buddhism, and Daoism), Confucianism is the most
devoted to geographical concepts, but geographical ideas also appear throughout the philosophical and religious writings of Buddhism and Daoism. For example, the idea of geography in feng shui, a theory of auspicious or harmonious spatial relationships, has been used to analyze topographical features and configurations in the placement and arrangement of houses or tombs. Despite its references to history, ethics, and other forms of social inquiry, Confucian geography could not avoid becoming a branch of “official learning” that rationalized and supported a highly stratified society.

The size of the area actually governed by the central government of China has changed many times throughout China’s history. As early as the fifth century BCE, the Chinese began to administer their territories by using geographical concepts. Yugong (The Tribute of Yu), a chapter of the sanctioned Confucian text Shangshu (The Book of Documents), is considered the oldest scientific treatise on geography in China. During the Han dynasty (206 BCE–220 CE) another influential geographical work, Hanshu Dili Zhi (The Treatise of Geographical Studies in Hanshu), a chapter of Hanshu (The History of the Earlier Han Dynasty) by Ban Gu (32–92 CE), appeared. This treatise represents the first officially sponsored monograph on geography and provides the first Chinese usage of the term “geography” (dili). Hanshu Dili Zhi illustrates the fundamental approach to Chinese geographical research for more than a thousand years. The Chinese often referred to this approach as the yange dili model—the word yange meaning “evolution” or “change”—its major focus embracing the ever-changing size of the national territory and the regional administrative divisions in China. Even though the Chinese yange dili is a specialized science, it has never been treated as a single field of study. Until 1900 there were only a few scholars who specialized in yange dili; the majority of Chinese scholars came from other fields, such as history, economics, and literature. During the Qing dynasty (1644–1912) the study of geography itself was in its heyday, and yange dili, traditional “dynastic geography,” was in its last stage.

Chinese scholars considered the formal discipline of geography to be one of the fundamental branches of knowledge. Dynastic geography was recognized as one of the xiaoxue, or prevailing studies. A number of scholars, including Gu Yanwu (1613–1682), Gu Zuyu (1631–1692), Yan Ruoju (1636–1704), Liu Xianting (1648–1695), Quan Zuwang (1705–1784), Zhao Yiqing (1710–1764), Dai Zhen (1724–1777), Li Zhaoluo (1769–1841), and Yang Shoujing (1839–1915), expressed a keen interest in geography. Their intellectual pursuits popularized the study of geography and fostered a new spirit in scholars participating in geographical research. The ultimate aim of geographical research was to ascertain the true history of geographical practices in past dynasties in order to provide a frame of reference for the contemporary management of geographical issues. But the Qing scholars assumed that the true history of geographical practices was to be found only in original documents, in faithful copies of the original dynastic records. In other words, “truth” for Qing scholars was definitely a textual truth. In their search for textual truth, they collated and checked texts, correcting any mistakes in the geographical records while adding to the basic texts more information collected from other sources.

Geography in China has commonly been considered an applied science developed to solve objective problems. Geographers have typically devoted themselves to explorations of objective geographical issues, paying relatively little attention to either self-examination or self-criticism. A fresh intellectual spirit transformed Confucian inquiry from a search for moral perfection to a more systematic search for empirical knowledge. A common field of inquiry and a shared discourse emerged among later Ming and early Qing scholars who insisted on the centrality of xiaoxue (minor learning) that is philology (in this context, textual criticism). Such philological concerns provided the necessary precondition during the Qing period for the formation of a new school.

Gu Yanwu and Dai Zhen led the new school of Ka-xianxue, evidential research, (also called Han learning), and the major focus of their works was to establish authentic editions of important ancient books. Scholars in the new school undertook the arduous task of collating the various geographical works and maps that had been handed down through the ages, with a view to correcting the accumulated errors on the basis of original official documents. Their works focused mainly on five areas: annotation, confirmation, collation, correction, and verification. The Qing scholars did not systematically summarize their rules for textual criticism, as their techniques were transmitted from generation to generation through exemplary works. Sanguo Zhizhu (An Annotated History
of the Three Kingdoms) by Pei Songzhi (372–451) and Zizhitong Jianzhu (An Annotated Comprehensive Mirror of Aid for Government) by Hu Sanxing (1230–1302) were regarded as models for textual criticism. Both Pei and Hu made a careful exegesis of the historical terms given in the original texts, supplementing this in their annotation with philological, historical, and geographical information. These academic works had a huge impact during the Kaoju movement for the Qing scholars who began to correct mistakes in their primary sources by comparing them with contemporary works. The Qing scholars tried (1) to find missing, misspelled, misused, and misplaced characters in the text; (2) to correct the historical facts given in the text, especially when the text contained anachronistic mistakes in the recording of official titles, the names of institutions, or the names of places; (3) to correct individual sentences in their primary sources, using the ancient rules of grammar and rhetoric; (4) to supplement their original texts by additional related sources so as to give a fuller, more accurate account. These scholars never doubted the value of the original texts; what concerned them was how to enhance the value so as to preserve the texts for future generations.

Consequently, the study of historical geography became an integral part of Kaoju, with geographical records and descriptions occupying a considerable proportion of the pages in the dynastic histories and Confucian Classics. As the Qing scholars reasoned, only a solid understanding of the geographical facts could provide a firm foundation for understanding historical events. The study of geography shaped within the Kaoju movement culminated in the golden era of yange dili in China. The term yange can be found in many titles of Qing geographical works such as Lidai Dili Yange Biao (Evolutionary Tables of the Geography of the Successive Dynasties) by Cheng Fangji and Lidai Dili Yange Tu (Evolutionary Maps of the Geography of the Successive Dynasties) by Yang Shoujing.

### Western Influence

Despite the effort of most Qing scholars using the Kaoju geographical method to examine the base of Chinese history, the understanding by the Chinese scholars was still based upon the Confucian world, which had been created by the sages in antiquity and maintained by imperial authority. There was no alternative analytical framework with which to think about world order or world structure. Before 1840, Chinese knowledge about the existence and distribution of countries and people outside China was sufficient to allow Confucian scholars to realize that China did not physically occupy the center of the world. The foreign invaders who both contributed to and followed the collapse of the Qing dynasty in 1912 brought a new wave of knowledge from outside and the traditional imperial ideology, including yange dili, came under attack. The dynastic geography was no longer considered a meaningful format to provide a compelling portrait of China and its land. The Chinese scholars finally realized that the Middle Kingdom was a poor and weak country, not the powerful, central "Heavenly Kingdom they had considered it in the past.

In the 1920s and 1930s the historian Gu Jiegang (1893–1980) took a "revolutionary" approach to Chinese historical geography. Gu’s historiography tended to undermine traditional concepts and values in Chinese history. He considered the geographical integration of the whole of Chinese civilization. Creating the term gudibian, critique of ancient geography, Gu Jiegang’s skeptical approach considered the creation of the Confucian geographical texts in their social contexts. To Gu, mistakes in the texts were not simply wrong characters, wrong names, or wrong years; they were the inevitable results of the very manner in which the texts had been composed and of the sociopolitical implications of the texts. His book, Gushibian (Critiques of Antiquity) rejects and reinterprets most of the traditional conceptions associated with Chinese classical history, casting doubt on the historicity of the sage-king Yu. Yu was described in Confucian texts as a great flood-queller, a selfless king who established the first dynasty of China, the Xia dynasty, and the creator of the geopolitical structure that dominated the Confucian geographical mind for thousands of years. Because the sage-king Yu was such an important figure in the Confucian construction of the Golden Age, it was unheard of for Chinese scholars to criticize him. According to the criticism of Yugong by Gu Jiegang, China as a political unit did not really exist before unification under the Qin and Han dynasties in the later third century BCE. Had there been a Xia dynasty established by sage-king Yu, as described in Confucian texts, its domain could not have constituted a tiny area nestled in the bend of the Huang
Gu pointed out that if the size of “China” had been small and subject to variation in high antiquity, the world outlook of its people would have been correspondingly diminished and subject to change.

Another contribution by Gu Jiegang was the organization of the Yugong Society and the creation of Yugong Banyuekan (Journal of Yu Gong) in 1934, bringing historical geography to the particular attention of China’s best scholars. Even though Gu had never traveled outside of China, nor had he made contact as a young man with Western teachers, he was heavily influenced by people who studied overseas. For instance, Gu was influenced by Hu Shi (1891–1962), who was educated at Columbia University with John Dewey. Hu advocated Dewey’s pragmatism, the essence of the scientific method. Gu’s ideological sources came from the lens of Hu Shi’s work. Three of his students, Tan Qixiang (1911–1992), Hou Renzhi (b. 1911), and Shi Nianhai (1912–2001), who later contributed a great deal to historical geography in China, were brought into his academic circle when Gu Jiegang established Yugong Society. The members of the Yugong Society were mostly teachers, editors, researchers, and students from Yanjing, Peking, and Furen Universities. Unquestionably, the most important contribution of the society was the publication of the semi-monthly magazine Yugong Banyuekan (Journal of Yu Gong), the first journal of historical geography in China. Until 1937, when the fate of Yugong Banyuekan was sealed by the Japanese invasion, the journal published a total of eighty-two issues containing a total of 710 articles. The subject of historical geography included topics such as dynastic geography, regional studies, and foreign relations with China. The Yugong Society intended to promote the following research projects involving historical geography in Yugong Banyuekan:

1. To rewrite a series of books on the evolution of Chinese geopolitics,
2. To make accurate and useful historical maps,
3. To correct all the documents and dynastic geographies,
4. To compile an accurate and inclusive dictionary of historical place names,
5. To collect materials on human geography,
6. To invite scientist to answer questions on the role of physical geography in history.

In the 1930s through the 1960s, China underwent a series of great social and intellectual transformations giving rise to most of China’s modern social sciences. Among Gu Jiegang’s three students, Tan Qixiang, Hou Renzhi, and Shi Nianhai, Tan and Hou contributed and promoted historical geography in China. Tan Qixiang published a number of historical geography books including his well-

“Ten-Thousand-Mile Map of Maritime Defenses,” drawn during the Qing Dynasty, circa 1705. This map, which is one of eleven maps mounted in an accordion-folded album fifty-one feet in length, shows military defenses along the Chinese coast from Hainan Island to the Shandong Peninsula. LIBRARY OF CONGRESS.
known eight-volume Zhongguo Lishi Ditu Ji (Historical Atlas of China).

In 1946, Hou Renzhi went to England and enrolled in the graduate program at the Department of Geography, Liverpool University; there he studied with H. C. Darby, a well-known historical geographer in the West. Hou is the only Chinese scholar who went to the West and received a foreign doctoral degree in historical geography during the Republican period (1912–1949). Hou was most intrigued by Darby’s ideas about the distinction between history and geography and about the proper use of the cross-sections method to approach questions of “geographical evolution.” During his graduate study, Hou Renzhi was also strongly influenced by the famous American historical geographers Andrew H. Clark and R. H. Brown.

Hou Renzhi contributed to the development of historical geography in China in the following ways: First, he broke through the framework of the traditional dynastic geography to apply modern geographical theory and terms to the study of past geography. Hou completed the transition from dynastic geography to historical geography. Second, Hou brought the landscape into the study of historical geography. Third, Hou encouraged research on changes in the physical environment, arguing that such research is vital if geographers are to develop a plausible theory about the dynamic role of man in the changing ecology of the earth.

In 1949, with his doctoral degree from England, Hou returned to China where he wrote a number of books including Zhongguo Gudai Dilixue Jianshi (A Brief History of Geography in Ancient China) and educated many students, including his successor at Beijing University, Tang Xiaofeng (a PhD with a specialty Syracuse University), the current director of the school’s Center for Historical Geography. Influenced by the well-known American historical geographer D. W. Meinig’s writings and teachings...
at Syracuse, Tang published his major book *From Dynastic Geography to Historical Geography* in China, where still only a few historical geographers could write and publish in the English language.

During Hou’s tenure at Beijing University, he recommended that the Chinese government change higher education policy. In the 1950s a number of universities began to list courses on lishi dili (historical geography) to replace the old courses on traditional yange dili (dynastic geography). Hou’s studies questioned the utility of all human constructs when considering Chinese ancient geographical structure. He necessarily promoted the devaluation of the Confucian classics and dynastic histories, arguing that insofar as the Confucian documents were preoccupied with given political questions, they could not help to answer the kinds of questions posed by modern geographers.

Historical geography in China has been a major field in China’s thousand-year history. After 1840, Western influence began to modify the development of historical geography. Today, historical geography has become one of the major studies in China’s higher education system. Currently, Tang Xiaofeng is one of the main figures who is a successor from Hou Renzhi in China.

Although the overall incidence of HIV/AIDS is low in China, it has reached epidemic proportions in several high-risk groups, including drug users and sex workers; migrant workers are especially vulnerable. The Chinese government has developed several programs that address prevention, treatment, and family services for HIV-affected populations. Discrimination against people living with HIV hampers effective identification and testing.

China’s first AIDS cases were discovered in 1989, but it took the outbreak of severe acute respiratory syndrome (SARS) in 2002 and 2003 to spur the government into launching aggressive measures against AIDS. The effectiveness of government and other organizational responses is hampered by the stigma and discrimination against those with HIV by the population at large, by the reluctance of public security authorities to support education and specialized treatment for those engaged in illegal activities (e.g., illicit drug use and commercial sex), and by the logistics of providing standard, consistent, and equal care in such a large, diverse country.

AIDS Situation in China

In 2007, studies showed that HIV was spreading both in numbers and geographically in China, but the percentage rate of new infection was decreasing from previous years. The incidence of HIV in China at the end of 2007 was very low overall at 0.05 percent, which translates to about 700,000 people. The estimated number of active AIDS cases was 85,000. Estimates have been much higher than the number of cases actually identified; nearly 80 percent of those living with HIV in China do not know they are HIV-positive. By comparison, only about 25 percent of Americans with HIV are unaware of their infection. HIV has been reported in all thirty-one Chinese provinces, municipalities, and autonomous regions, but it is most prevalent in Guangdong, Henan, Sichuan, and Yunnan provinces and in Guangxi and Xinjiang ARs. Henan was the site of a 1990s HIV outbreak among rural residents who became infected by unhygienic practices and contaminated equipment at commercial plasma-donation centers. Most other affected areas are in rural border provinces or along heroin-trafficking routes where HIV transmission is fueled by injection-drug use. HIV infection is highest in the twenty-nine- to thirty-nine-year age group; AIDS cases are concentrated in the twenty- to forty-nine-year age group. Routes of transmission include needles and/or drug use, heterosexual sex, and homosexual sex among men. Transmission by the sharing of infected needles among illicit drug users was the main mode of transmission until 2007, when sexual transmission became the more prevalent mode. Certain at-risk groups have a high incidence of infection, and HIV is spreading to the general population through sexual transmission. Migrants are considered especially vulnerable.
High-Risk, Vulnerable Groups

High-risk behavior by certain subpopulations is driving the epidemic, and the government has undertaken education and prevention programs that target these groups.

Injecting Drug Users

The use of contaminated needles when injecting illicit drugs is the second most common HIV transmission route in China. In 2007, approximately 8.3 percent of drug users had HIV. High-risk behavior includes needle sharing. Some support their habit by turning to commercial sex work, thus increasing transmission to the non-drug-using population.

Understanding that reducing drug use is linked to control of HIV/AIDS, the Chinese government authorized the rapid establishment of methadone-maintenance therapy sites, both fixed and mobile, along with needle exchange programs throughout the country.

Sex Workers

The commercial sex trade is increasing in China, especially in eastern areas. Some surveys suggest that one in ten sexually active men has bought sex from a prostitute. The real number may be higher. Knowledge of HIV and transmission routes is low among sex workers, and even if sex workers know about HIV/AIDS, it can be difficult for them to insist that clients use condoms. Official attitudes toward commercial sex workers make it difficult to target them in government-run education and health programs. The incidence of other sexually transmitted diseases (STDs) is also increasing in China; people, especially women, with untreated STDs are much more likely to catch HIV from infected partners than are people without STDs.

HIV-prevention efforts directed toward this high-risk group focus on the nighttime entertainment industry that is burgeoning in China. Condoms are distributed in hotel lobbies and guest rooms as well as popular karaoke clubs and other entertainment venues where transactional sex occurs.

Migrants

Chinese migrant workers, who are often young and single, flock from rural to urban areas to find work. The challenges of adjusting to urban life while being separated from their families and social networks increase the possibilities for high-risk behaviors among sexually active migrant workers.
Male migrants might turn to prostitutes and have relations involving multiple sexual partners, while female migrants might engage in commercial sex. Many of the estimated 150 million migrant workers lack prevention knowledge and have limited access to community support, health services, condom supplies, and information about HIV, and so are especially vulnerable. Figures from the Hunan Province Center for Disease Control show that the mobile population, mainly migrant workers, accounted for 77.1 percent of HIV/AIDS patients in the province in 2008.

A 2008 joint program of China’s Ministry of Health, the All-China Federation of Trade Unions, and the International Labor Organization is designed to prevent the spread of HIV/AIDS among the mobile population in China. The three-year program, covering key industries in areas with a high concentration of migrant workers, will focus on prevention education, promote the use of voluntary testing, and will monitor discrimination in the workplace. Numerous other programs targeting migrants have been implemented across the country since 2004.

FORMER BLOOD PLASMA DONORS

At the end of 2007, over 19 percent of those with HIV/AIDS had been infected through blood and plasma collection. Donor blood, untested for HIV, was pooled and injected back into donors to prevent anemia. Because they were paid for their blood, many of these people donated multiple times. These individuals have been identified through aggressive testing campaigns, while treatment and prevention programs have effectively stopped HIV from spreading beyond this group. Blood-pooling practices have been outlawed, and China’s blood supply, now nearly 100 percent from volunteer donors, is regularly tested for HIV.

HOMOSEXUAL SEX AMONG MEN

HIV has been identified in some urban areas among male homosexuals, but this population is stigmatized and is difficult to survey. There are strong taboos against homosexual behavior in China, where men are expected to marry and produce male heirs. Estimates of the population of men who have sex with men range from 5 million to 10 million, and the number may well increase as social mores continue to change. Chinese health officials estimate that nationwide about 1 percent of male homosexuals are HIV positive, though some surveys have found higher rates of infection. The government has increased budgets and established an advisory group that includes activists and behavioral specialists to formulate policies designed to reach this marginalized population.

Government Activities

A framework known as the “Three Ones” has helped to streamline and strengthen the national response to HIV/AIDS: one national plan (China’s Action Plan for Reducing and Preventing the Spread of HIV/AIDS 2006–2010); one national authority coordinating the response (State Council AIDS Working Committee); and one monitoring and evaluation system (AIDS Monitoring and Evaluation Protocol of June 2007). The Regulation on AIDS Prevention and Treatment was issued by the State Council in early 2006. Premier Wen Jiabao and Vice Premier Wu Yi showed their support of people living with HIV and children affected by AIDS through personal visits to “AIDS Villages” and AIDS wards in Beijing hospitals. Children orphaned by AIDS, along with doctors and teachers, were their guests at a gala concert in 2006.

In addition to targeted prevention programs, the Chinese government has developed programs and policies to care for those who have contracted HIV/AIDS. First implemented for former plasma blood donors who contracted HIV/AIDS, the China CARES program (China Comprehensive AIDS Reseponse) has been instrumental in halting the epidemic in that group. Now operating in 127 rural counties and available to other HIV/AIDS patients, the program offers free antiretroviral treatment to HIV patients, provides family planning and free condoms, coordinates getting free education for children, subsidizes affected children, and operates orphanages for children whose parents are dead or incapacitated because of AIDS.

The “Four Frees and One Care” policy, operating as of 2007 in 1,190 counties in all provinces and autonomous regions, commits the government to providing many of the same services to rural residents and low-income urban residents: free antiretroviral drugs to those with HIV; free voluntary counseling and testing; free treatment to prevent the spread of HIV from pregnant women to newborns; free schooling for children orphaned by
AIDS; and care and economic assistance to households affected by HIV.

**International Cooperation**

The United Nations—through its Theme Group on HIV/AIDS, which helps coordinate the international response against AIDS in China, and its China Country Team, which provides support for reducing vulnerability and risk behavior and improving treatment, care, and support for people living with HIV/AIDS and their families—is a major source of international support. The Global Fund to Fight AIDS, Tuberculosis, and Malaria is the largest monetary donor for China’s efforts to address the HIV/AIDS epidemic; the United Kingdom’s Department for International Development and the United Nations system also contributed.

China has provided assistance to other countries in their fight against HIV/AIDS. The Chinese government provides training in HIV/AIDS prevention for African countries, where the incidence of HIV/AIDS is the highest in the world. In return, China profits from African expertise in AIDS awareness programs.

**Challenges**

In their 2008 joint report on the status of AIDS in China, the State Council and UN China Theme Group on HIV/AIDS identified several challenges facing the HIV/AIDS response in China, with recommendations to increase the effectiveness of China’s HIV/AIDS programs.

Awareness campaigns to address widespread discrimination in communities and work places, including health care facilities, need to be undertaken. The involvement of people affected by AIDS in the design and implementation of informational and educational messages remains weak and should be strengthened for more effective outcomes. Antinarcotics policies and practices, such as surveillance and arrest of those seeking clean needles or methadone treatment, often conflict with HIV prevention efforts; more coordination with security authorities is needed. Current information, education, and communication activities need to be broadened, especially those for youth not in school, for minorities, and for remote and rural areas with migrating populations. Government-funded treatment programs are facing growing incidence of drug-resistant strains of HIV, requiring the provision of expensive, imported “second line” drugs and enhanced training for medical workers.

China has made great progress in its HIV/AIDS programs, moving from an emergency response to a standard treatment approach. But much remains to be done, especially in China’s rural areas, where the epidemic is most widespread and where poor residents have little access to health care. Thus, the work of controlling the epidemic will largely fall to county-level jurisdictions. As the Joint Assessment report notes, with more than three thousand counties in China, the task of ensuring an effective and relatively standard response will be an enormous one.

Hmong ▶
The Hmong, whose own name for themselves is not officially recognized in China, are a mainly agricultural people living mostly in the southern provinces of Sichuan, Guizhou, and Yunnan, as well as Guangxi Zhuang Autonomous Region; there is also a considerable diaspora population in Southeast Asia and abroad. Hmong customs show traces of the earliest customs ever recorded in China, leading some scholars to believe that they were in China before the Han Chinese.

The Hmong account for about a third, some 3 million people, of the Miao people, one of the fifty-five officially recognized ethnic minority peoples in China. They live as farmers in villages in a unified swathe of territory reaching down from north to south in the provinces of Sichuan, Guizhou, and Yunnan, as well as the Guangxi Zhuang Autonomous Region toward the Vietnamese border. In Chinese history they are referred to only as Miao, together with the members of two other main language groups related to them by distant ties of language and custom, but whose languages they cannot understand. Since 1850, Hmong shifting cultivators (people who farm a plot of land temporarily and then move on to cultivate another) have migrated across Chinese borders into the mountainous regions of neighboring Vietnam, Laos, Thailand, and Burma. Many Hmong from Laos were further resettled as refugees overseas following the Vietnam wars to third countries such as the United States, France, Canada, and Australia. There are some 1 million Hmong in Asian countries outside China and approximately 320,000 in diaspora.

**History**

Throughout history the Hmong, under the rubric of Miao, were generally described as shifting cultivators of the mountainsides. They planted upland crops, such as millet, buckwheat, and maize, moving their villages great distances once the fertility of the soil was exhausted. There are various legends and theories about their ultimate origins, but it is most probable that they originated in the Huang (Yellow) River valley basin. They were recorded in Chinese annals as early rebels against the establishment of the Chinese state, having been banished from the central plains around 2500 BCE. Rebellions of the Miao against the Han Chinese are recorded since the Han dynasty (206 BCE–220 CE). The expansion of the Han Chinese people into southern China since the Song dynasty (960–1279) led to increasing pressure on scarce resources, such as water and land, and fierce conflicts with local minority people who inhabited these regions.

The encounter with in-migrating Han Chinese troops, farmers, miners, and merchants, and the colonization by the Chinese of the southwest in the Ming (1368–1644) and Qing (1644–1912) dynasties led to important divisions within minority people like the Hmong. Some became more settled and law abiding, adopting Chinese customs and manners, while others remained in the remote
mountains beyond the reach of the Chinese state. The Chinese referred to them for this reason as the Sheng (raw, or wild) and Shu (cooked, or tame) Miao. Hmong customs show traces of the earliest customs ever recorded in China, such as the courting game of catch played at the New Year still retained by Hmong outside China. For this reason some researchers have seen them as aboriginal Chinese who may have inhabited China before the Han Chinese. There have certainly been strong Chinese influences on the Hmong in history. A high proportion of their language is shared with Chinese, and they adopted Chinese surnames for their clans.

**Economy and Socialist Impact**

Hmong traditional economy was in most areas based on the shifting cultivation of upland crops, along with the animal husbandry of poultry and swine, hunting, some fishing, and gathering of wild products in the forest. In the late nineteenth and early twentieth centuries, opium was cultivated in remote mountainous areas in exchange for silver with itinerant traders. However, in some areas Hmong were able to farm small patches of irrigated rice-land on terraces or in valley basins, where settled villages were established.

With the establishment of the People’s Republic of China in 1949, opium cultivation was banned and shifting cultivation was outlawed. Remote upland villages were resettled in lowlands. Hmong villages joined cooperative socialist organizations and agriculture was collectivized. Communist Party organization penetrated the villages and organized much of social and economic life. Traditional religion, such as ancestor worship and shamanism, was illegal but still continued in secret and at night. During radical left periods, such as the Great Leap Forward beginning in 1958 and the Cultural Revolution (1966–1976), it was prohibited to sing minority songs, speak minority languages, and wear ethnic costumes. As members of an official ethnic minority, the Hmong received some special privileges in the form of a measure of autonomous local government in many areas (although this autonomy is limited) and special lower pass marks for college and university entrance (although the numbers of Hmong achieving this status have been minimal). However, special funds were allocated for minority regions, which benefited some Hmong areas.

Under the household responsibility system, which followed the death of Chairman Mao in 1976, some measure of autonomy has been returned to the Hmong household, which was traditionally the main basis of the social system. Families now work together again as an economic unit in cultivating the areas of land allotted to them by village organizations according to the number of household members. They cooperate with other members of the local lineage and affinal relatives (those related by marriage) in ritual, social, and economic affairs. The Hmong generally live in brick houses in rural villages much like those of the Han Chinese. The greatest concentration of Hmong is in Wenshan Autonomous Prefecture on the Vietnam border; Bijie in northwest Guizhou is another area of dense Hmong settlement.

**Culture and Kinship**

In the past the Hmong were divided into a number of tribal cultural divisions. These still survive outside China in the form of strong divisions between Green and White Hmong in Laos and Thailand. They still wear different costumes, and they live in houses of a different design and speak consistently different dialects. Even outside China these divisions have become less significant as members of different cultural divisions intermarry and live in the same villages. In Wenshan there is some memory of these divisions, reflected in still different dialects and traditional costumes (now worn only at festivals), but Communist Party policy firmly discouraged such signs of local cultural variation and in most places they have almost disappeared.

Hmong culture, from China to Thailand, remains remarkably homogeneous. This may have resulted from their traditional life as shifting cultivators, which distributed uniform cultural traits widely over great geographical distances. There is a range of Hmong dialects, but they are all recognizably part of the same Hmong language, and the rituals of death and shamanism, which now, to some extent, have been revived in China since the more relaxed economic reform policies since the 1980s, are similar within China and beyond its borders.

Hmong culture is rich and complex and full of oral
legends and dramaturgical performances at marriage, death, and illness where traditional shamans are still consulted. For example, there are the elaborations of the wedding ceremony and the beauty of the women’s intricate batik and embroidery; festivities of the Hmong New Year; the long, mournful chants of the Master of Death as he guides the soul of the deceased back to the village of its ancestors at the dawn of historical time; and the shaking of the shaman as he or she enters the Otherworld in trance to rescue the lost soul of a sick person.

The Hmong share with the Chinese and other ethnic minority people in southern China a system of geomancy (divination by means of forms of the landscape) to determine the location of houses and graves in which human residences are aligned with the natural contours of mountains and rivers.

At the heart of Hmong culture is the kinship system and the division of all Hmong into some twenty patrilineal exogamic (out-marrying) surname groups or clans. These surnames, such as Lee, Wang, or Yang, reach across the cultural divisions. Intermarriage is still forbidden among them, even in China where members of the same surnames (generally huge in number) are legally allowed to marry. The lineage is divided into ritual sublineages clustered around a common known ancestor and known as ib tus dab qhuas (of one group of spirits). It is still the case that a visiting Hmong of the same surname will be treated as a classificatory brother by those of the same surname, wherever he comes from (even the United States). Marriage with other groups, however, still remains very rare, even in villages where Han Chinese and Hmong have lived together for several generations.

In traditional society Hmong women occupied a low position, although one higher than that of most Chinese women, and there was considerable freedom in premarital courtship. In post-1949 China, while premarital liaisons are generally forbidden, the position of Hmong women
has much improved. A Hmong woman at marriage is still expected to leave the household of her natal family and move to that of her husband. The wedding process is elaborately celebrated and can be protracted, including ceremonial presentations and wedding songs sung by go-betweens who represent both parties to the marriage. The bridegroom is expected to present to his bride’s family an expensive bridewealth, which was traditionally paid in silver and is said to compensate the bride’s parents for their trouble in raising her. A young man is often dependent on his parents for this requirement, which today generally takes the form of furniture and clothes, besides the pork and whisky expended on the wedding feast. Strict monogamy is expected of a wife; a man traditionally could take two or more wives, although this rarely occurred and is now illegal. The one-child, one-family policy has affected the Hmong, as it has all people in China. However, in some areas, because they are impoverished or ethnic minority people, there are exemptions, and a couple may be allowed three or even four children in some cases, without any fines or imprisonment.

Foreign missionaries have worked among the Hmong for over a century, arriving in Guizhou in 1875 and working in Yunnan and northern Vietnam shortly after that. Many Hmong converted to Protestantism at the turn of the twentieth century in an extraordinary mass movement and some of them continued their faith throughout the years of socialist revolution. A smaller number have become Catholics. Recently new converts to Christianity have been made along the Vietnam border, which has led to persecution and imprisonment and the flight of some Hmong across borders into neighboring countries.

**Homecoming**

Since the 1980s, under newly liberal policies and the impact of the tourist industry, there has been an enormous revival of interest in and sympathy for traditional ethnic minority culture in China, and the Hmong have proved no exception to this. Many local Hmong scholars have recorded their own customs and transcribed parts of their traditional oral culture. Some overseas Hmong, particularly from the United States, have begun to revisit their old homes in Laos, their more remote places of family origin in Vietnam, and even the homes their ancestors left many generations ago in southern China. New connections between transnational Hmong communities have been formed, helped by the use of videos, mobile phones, and the Internet, and some global trading relations have been established between Hmong in China and Hmong in the West, particularly for the marketing of traditional Hmong costumes now required overseas. These new contacts have been spearheaded by Hmong and other Miao minority cadres now working in universities or local provincial research institutes or at minority colleges or in governmental organs such as the Ethnic Minority Affairs Commission, which is in charge of minority affairs in China. Whether these new connections will lead to a new kind of emergent global Hmong community, or whether they represent a vain attempt to reconstitute a community already divided and scattered across the world by migration and war, it is too early to say.

Homosexuality during China’s long history can be traced through literature, accounts of life both inside and outside the imperial courts, and in attitudes about male prostitution. In recent years, more egalitarian relations have developed, but few people make homosexuality their core identity.

Historically, homosexual relations between men in China often involved a person of lower status seeking the favors of someone more powerful, whereas women who lived in communities without men sometimes formed monogamous relationships formalized by ceremony. In modern China efforts are being made to approach homosexuality in both genders without stereotyping or using the labels gay and lesbian.

Traditional Male Homosexuality

In China the oldest known reports of male homosexuality appear in the earliest poetry anthology of the Zhou dynasty (1045–256 BCE). In this period heterosexual marriages were frequently negotiated for other than romantic reasons, and men were free to search for satisfying sex and romantic love elsewhere, including in homosexual relationships. Homosexuality was typically structured in terms of class, with courtiers seeking the love of powerful men because of the concomitant benefits of such alliances, as in the instance of Lord Long Yang, who made elaborate efforts to prove his devotion to the king of Wei. During the Han dynasty (206 BCE–220 CE), the emperor’s favorites attained enormous prominence at court, and in one instance the dying emperor Ai (reigned 6 BCE–1 CE) even gave the throne to his favorite, Don Xian. Don Xian’s enemies, however, forced him to commit suicide and usurped the throne.

The first-known sources on homosexuality outside court life date from the North and South dynasties (220–589 CE). In Shishui xinyu (A New Account of Tales of the World) by Liu Qing (403–444 CE), male beauty is a major focus of attention. The Tang dynasty (618–907 CE) provides fewer records of homosexuality at court than did earlier periods, although homosexuality was more often mentioned in literature and particularly in poetry. The first derogatory term connected with homosexuality, jijian, usually translated as sodomy, surfaced during this period in the story of the male prostitute Xue Aocoa.

During the Song dynasty (960–1279), homosexuality apparently continued to be more common outside court circles, and evidence for it increased. Whereas in earlier times patronage consisted of emperors and other high-placed persons bestowing presents and honors on their favorites, in the Song period this patronage took the form of straightforward prostitution in the major cities. Prostitutes were typically seen as passive and receptive. Whereas in earlier times some relationships had been ones of love, the patron/prostitute relationship was purely sexual.

In the early twelfth century male prostitution was legally prohibited, but the law seems not to have been often enforced. The Ming dynasty (1368–1644) was a time of greater tolerance, with a flowering of literature depicting
homosexuality that reflected patronage relationships before prostitution. During this period clashes over homosexual activity with foreigners occurred. In Manila, for instance, the Spanish arrested and condemned Chinese immigrants who protested that homosexuality was an accepted custom in their culture.

During the Qing dynasty (1644–1912), literature on homosexuality remained rich, and prostitution was common. In 1860 a Western visitor to Tianjin reported that there were thirty-five brothels and an estimated eight hundred boys engaged in prostitution. Sources of information about male prostitutes largely described actors who were elite prostitutes. There were sodomy laws at this time, and under Manchurian influence intolerance toward homosexuality began to emerge, though the practice continued to flourish.

### Traditional Female Homosexuality

There is relatively well-documented information about women’s communities in imperial China, especially in southern Guangdong. In such communities women could resist social demands that they marry, and particular economic opportunities enabled these women to live largely independently of men. This appears to have been the case in the silk industry. Women in these communities held marriage ceremonies and lived like couples. In Chinese-dominated states, including Singapore, such communities have persisted.

As early as the Han dynasty, there is literary evidence of female homosexuality, including a love relationship between two slave women, as well as an empress's servant who dressed in male attire, suggesting a lesbian relationship. The famous Qing dynasty novel *The Dream of the Red Chamber* also contains depictions of lesbian affairs.

### Contemporary Male and Female Homosexuality in China

Homosexuality in China today continues to be associated with male as well as female transgender practices, but such viewpoints have begun to be questioned. Nowadays the words *gay* and *lesbian* are often used in place of the traditional terms, especially among highly educated people, who tend to distance themselves from the transgender implications of indigenous concepts.

In China as well as Hong Kong and Taiwan, a movement has developed to accommodate this conflict between traditional and contemporary ideas of homosexuality. The common denominator used for gay men, lesbian women, transgender and transsexual people, and even supportive heterosexuals is *tongzhi*, which is the Chinese Communist term for *comrade*. The introduction of the term *tongzhi* is a product of the wish to avoid the explicit sexual overtones of other terms for gay men and lesbian women and at the same time to create a network that overcomes the limitations of identity-oriented categories like *gay* and *lesbian*.

Hong Kong

Xiānggǎng  香港

6.9 million est. 2008 pop.

Hong Kong has one of the most important import-export and finance economies in the Pacific region. It became a British colony in 1842 but was returned to the People’s Republic of China in 1997. It is now known as the “Hong Kong Special Administrative Region” in recognition of its economic importance, which the PRC has committed to respecting until 2047.

Hong Kong was part of China’s Guangdong Province until it became a British colony in 1842. In 1997 Hong Kong was returned to the People’s Republic of China (PRC) and is now known as the “Hong Kong Special Administrative Region.” During its colonial era Hong Kong became one of the most important import-export and finance economies in the Pacific region. Today it remains a vibrant, modern Chinese city with a diverse range of cultural influences and a thriving capitalist economy.

History

Located on the south coast of China near the mouth of the Pearl River, the area that is now known as “Hong Kong” comprises Hong Kong Island, Kowloon Peninsula, and the New Territories. Until the 1840s this area was part of Xinan County in Guangdong Province of the Qing dynasty (1644–1912). The region was populated mostly by Han Chinese and Hakka (a Chinese minority people), and the local economy was dominated by pearl fishing, salt making, incense tree cultivation, and piracy and smuggling.

The British, seeking a new location from which to maintain their lucrative opium trade with China, occupied Hong Kong Island in 1841. They were granted formal control of the island by China in 1842 through the Treaty of Nanjing, which ended the First Opium War (1839–1942), and the island became a colony on 26 June 1843. The Second Opium War (1856–1860, also known as the Arrow War) resulted in Britain’s acquisition of Kowloon Peninsula, located across the bay from Hong Kong Island, and in 1898 Britain acquired a ninety-nine-year lease on the New Territories. Britain maintained control of Hong Kong until 1997, except from 1941 to 1945, when the Japanese controlled the territory. The impending end of the lease on the New Territories led to a 1984 agreement between the British and Chinese governments for Hong Kong’s return to China as an autonomous region.

Political System

Under the British the governor, who was appointed, had executive power and was assisted by the Legislative Council, of which a small percentage was elected. This system, which was made somewhat more democratic under the
leadership of Governor Chris Patten in the 1990s, has remained essentially intact in the post-1997 era. In March 1990 the PRC’s National People’s Congress approved a “Basic Law,” based largely on English law, which constitutes the basis for Hong Kong’s current legal system. Under this system Hong Kong has an appointed chief executive who serves for five years, an appointed cabinet, and a legislature that is selected by both direct and indirect elections.

As a condition for the 1997 handover, China agreed to maintain a “one country, two systems” approach to governing Hong Kong for fifty years. Under this system Hong Kong is to have a high degree of political and economic autonomy from China. Its foreign and military affairs, however, have been taken over by the PRC government. In addition, Hong Kong’s chief executive is appointed by the PRC.

Geography
Hong Kong has a tropical monsoon climate. It has an area of 1,097 square kilometers with 733 kilometers of coastline and a large deep-water harbor. The territory consists of a peninsula and more than two hundred small islands and is mostly mountainous with a small percentage of arable land. The hilly terrain provides relatively little living space, and so both Hong Kong Island and Kowloon have been enlarged through land reclamation. Architecturally, Hong Kong is composed almost entirely of large office and apartment blocks. Hong Kong is connected to the rest of China by waterways, such as the Pearl River, as well as railroads and roads.

Demographics
The density of Hong Kong is 6,352 people per square kilometer, making Hong Kong one of the world’s most densely populated areas. Ninety-five percent of the population is ethnically Chinese, with Filipinos, Indonesians, British, and Indians constituting the largest other ethnic groups.

Economy
Prior to its colonization by the British, Hong Kong had long been the site of both legal and illegal trade with neighboring Asian nations, Arabs, and some Westerners. Under the British the colony replaced Guangzhou (Canton) as the principal locus of Anglo-Chinese trade in southern China, much of which, in the nineteenth and early twentieth centuries, was based on opium. This trade was controlled by a few large trading houses, known as hong. After the establishment of the PRC in 1949 Hong Kong experienced a huge influx of refugee industrialists, mostly from the Chinese industrial city of Shanghai. These industrialists, using refugee labor that continued to flow into Hong Kong through the second half of the twentieth century, turned Hong Kong into a center of manufacturing and finance. Hong Kong has limited natural resources, however, and must import most of its food and raw materials. As China increasingly opened up for trade in the 1980s and 1990s, Hong Kong’s economy again became more oriented toward China.
Culture

Hong Kong’s culture has been influenced by its mostly Chinese population as well as its British colonial past. Its official languages are Cantonese and English. Its population has always been mostly Chinese, and this fact is reflected in the cuisine, popular culture, and many aspects of the landscape. The British elite who dominated colonial Hong Kong were mostly merchants, civil servants, and missionaries. As the post-1949 Shanghai industrialists established themselves financially; however, Hong Kong’s elite culture became increasingly Chinese.

Hong Kong’s colonial past led it to develop differently from the rest of China, especially during the period after 1949. Unlike the rest of China, Hong Kong has a thriving, free market, capitalist economy, and the very identity of Hong Kong is rooted in that successful economy. Although the PRC has committed itself to protect Hong Kong’s economic and political autonomy until 2047 (fifty years after the handover), what exactly will be the impact of Hong Kong’s reintegration into China remains to be seen. Will Hong Kong remain distinct from China, or will it become just another Chinese city?

J. Megan GREENE

Further Reading

With the return of the former British colony of Hong Kong to Chinese sovereignty in 1997, the city became a “Special Administrative Region” of the People’s Republic of China. Hong Kong SAR is now an independent and, for the most part, self-governing entity of China. While it does not have control over defense and foreign affairs, Hong Kong maintains an image as China’s international city; it joined the World Trade Organization in 1995, six years ahead of the PRC.

Hong Kong, with Macao, is one of two Special Administrative Regions (SARs) of the People’s Republic of China (PRC). Established in 1997 with the return of the former British colony to Chinese sovereignty, the Hong Kong SAR, as a virtual administrative district of China, is a legal entity underwritten by the Basic Law, or mini-constitution. The Hong Kong Basic Law, established between the former administering power, Britain, and China, was in turn drafted in accordance with the joint declaration entered into by London and Beijing in 1984 and adopted by the Seventh National People’s Congress (NPC) of the PRC in 1994.

Establishment of SARs was first provided for in Article 31 of the Constitution of the PRC promulgated in 1982. Still, one should acknowledge that in 1972 the PRC ambassador to the United Nations, Huang Hua, formally placed on record at the United Nations Special Committee on Decolonization China’s policy on the return of Hong Kong and Macao as legacies of “unequal treaties.” Hong Kong and Macao were duly removed from the list of territories pending decolonization.

The “one country, two systems” formula imposed on Hong Kong would, two years later, also become binding on Macao, then under Portuguese administration, and remains the formula that Beijing seeks to apply to Taiwan.

The Sino-British Declaration and the Hong Kong Basic Law stipulate that Hong Kong will be governed with a high degree of autonomy until 2047, or fifty years after the transfer.

Although maintaining a high degree of autonomy (Article 2), the Hong Kong SAR is short of being an independent jurisdiction, especially as Beijing retains control over foreign affairs and defense. Under the SAR formula, Chinese-style socialism is not to be introduced into Hong Kong; rather, its prevailing capitalist system and way of life are guaranteed for fifty years (Article 5).

Notwithstanding Beijing’s control over foreign affairs and defense, Hong Kong maintains an international legal personality. For example, since 1992 Hong Kong has been a member of Asia Pacific Economic Cooperation, and on 1 January 1995 Hong Kong gained membership in the World Trade Organization ahead of China. Today, with Beijing’s concurrence, Hong Kong is party to hundreds of conventions, organizations, and agreements under the “Hong Kong, China” name.

The chief executive—head of government—in the Hong Kong SAR is indirectly elected by a college of five hundred to eight hundred members closely sanctioned by Beijing. Tung Chee Hwa, the first chief executive,
assumed office on 1 July 1997. His successor, Donald Tsang, took office on 16 June 2005.

Laws are enacted with the approval of the chief executive and the majority consent of members of the sixty-seat Legislative Council (Legco), currently (under the third post-handover term) with half directly elected and half indirectly selected by “functional constituencies.” As of 2008 thirty “functional constituency” lawmakers are elected by sixteen thousand voters in twenty-eight business and professional sectors. For many people in Hong Kong such an arrangement appears to be a colonial legacy reflecting vested business interests and inimical to full democratization. The Basic Law does, however, provide for the eventual election of all seats under universal suffrage. Elections were held in 1998, 2000, and 2004, with candidates representing a range of political views from openly pro-Beijing to democratic and reformist. Deemed especially controversial was the proposal by the government to enact an anti-subversion law based on an interpretation of Basic Law Article 23. Public outrage over the proposal, viewed as a threat to civil liberties and even foreign business, has brought a shift in public attitudes in favor of greater democratization. Protests against the proposal were led by the so-called pan-democrat camp, with the chief executive playing the role of broker between Hong Kong public opinion and civil society actions and the NPC. Importantly, the Standing Committee of the NPC has the power to interpret the Basic Law (Article 159).

On 29 December 2007 the Standing Committee ruled out the possibility of universal suffrage for the election of both the chief executive and all legislators in 2012 as per the registered wishes of a majority of Hong Kong residents. Although the NPC did concede the direct election of the chief executive by 2017, many questions remain as to the modalities of such an election,
especially because Beijing insists on preapproval of all candidates. Although the NPC held out the prospect of a future directly elected Legco and the chief executive backed 2020 as a goal, the NPC also insisted on freezing the 50–50 split between directly elected and “functional constituency” seats in the Legco, thus disallowing even incremental democratization in the 2012 elections. Although a timetable for democratization has been established, frustration remains among those disappointed at the slow pace of change and loopholes that would allow even the decision on 2017 to be changed at any time.

Much uncertainty hounded the early years of the Hong Kong SAR, created by sagging real estate values, the outbreak of the SARS (severe acute respiratory syndrome) virus, the worldwide economic downturn, and unacceptable pollution levels; nevertheless, few would doubt that Hong Kong retains its vitality and image as Asia’s international city, notwithstanding the challenges posed by massive economic and social change within China itself.

Hong merchants were licensed by the Qing dynasty government to trade with foreign merchants at Guangzhou (Canton), the only Chinese port open to foreign trade from 1759 to 1842. Many became prominent and wealthy.

Since the early days of Sino-Western trade in Guangzhou (Canton), Chinese merchants who were licensed by the Qing dynasty (1644–1912) to trade with foreign merchants were known as “hong merchants.” The term came from the name of the trading guild, Cohong, established in 1720, to which they all belonged. Because their number was restricted to about a dozen or fewer at any one time, and as the trade volume grew to substantial size by around 1775, many hong merchants became some of the most prominent and wealthy merchants in China.

During the early nineteenth century the most powerful hong merchant was Houqua (d. 1843). The full extent of his wealth is not known because besides running extensive business enterprises in China, Houqua formed joint ventures and partnerships with Russell & Company, a U.S. firm that did business in China. He consigned specific shipments of goods to Russell & Company for sale overseas without the knowledge of the Chinese state. He also invested directly in the United States, including in stocks in the transcontinental railroad. From what can be gleaned from various accounts, Houqua appears to have been worth several million U.S. dollars and thus may well have been the richest man in the world at that time.

Not all hong merchants were as successful. Indeed, many, for a variety of reasons—highly speculative ventures, poor management, unduly heavy pressure from government officials, conspicuous consumption, simple bad luck, among others—had to declare bankruptcy. These failures became so prevalent in some years that by 1775 the Cohong decided to establish a kind of self-insurance fund, called the “Consoo Fund,” to cover the debts left behind by its bankrupt members. The fund was officially recognized in 1780. Each member paid 10 percent of his previous year’s profit to the fund annually. In 1789, in order to ensure that no debts would be owed to foreign merchants, the Qing authorities imposed a 3 percent levy on foreign imports that went to augment the fund.

Although the main functions of the hong merchants were the buying and selling of goods for the foreign merchants who congregated at Guangzhou, the only Chinese port opened to foreign trade from 1759 to 1842, they were also assigned to secure the port, to collect all the port charges and papers for each arriving or departing foreign vessel, and to guarantee the good behavior of individual foreign merchants. With respect to the goods they sold to foreigners, hong merchants also stood behind quality and authenticity thereof, and if goods were returned, then the hong merchants were obligated to replace them without charge. They also gave advice to supercargoes (officers on merchant ships who were in charge of the voyage’s commercial concerns) and to private traders. Indeed, many lifelong friendships were struck between Western and hong merchants, and their advice often extended from the professional to the social and personal. These friendly relationships, however, did not result in greater mutual
understanding of each other’s culture. Because Chinese officials refused to have direct dealings with European and U.S. merchants, hong merchants had to serve as intermediaries.

Thus, in addition to handling business matters, they took care of foreign merchants’ personal needs, such as petitioning grievances, finding living quarters and household servants, and getting official permits to leave their living compounds for occasional outings in the countryside. These official functions, together with the considerable customs fees that they collected for the Imperial Household Bureau—because all taxes levied from foreign trade went directly into the emperor’s private purse—gave them access to senior officials and opportunities to receive official commendations. Several second- or third-generation hong merchants were scholars who had passed the state examinations and were therefore treated as social equals by the local officials. As a group, they occupied a rather unique place among the Chinese merchant class. But the hong merchants’ exclusive trading privileges with foreigners and their position as intermediaries between foreign merchants and Chinese officials came to an end in 1842 with Great Britain’s victory over China in the First Opium War (1939–1942). The hong merchants and their Cohong guild were disbanded, and they came to be regarded as relics of a period when the Chinese world and the Western world came together without much mutual understanding. The Chinese government did not recognize foreign trading as a private citizen’s right. According to normative Confucian values, trading with foreigners was an element of diplomacy and therefore ought to be highly controlled and limited in scope. Nevertheless, it was not a matter of sufficient importance to involve the state directly, and hence, any communication between Chinese officials and foreign merchants was channeled through hong merchants. On the other hand, both the Chinese and the foreign merchants worked successfully together because they shared a similar set of values about private enterprise and profit motives. After 1842 many of the hong merchants, joined by newcomers, continued to engage in foreign trade in the form of compradors (Chinese agents in the employ of foreign firms). The Chinese worldview itself remained fractured, and another generation or two would pass before the Chinese state gave proper recognition to international trade and the critical role played by the hong merchants.

HONG Shen
Hong Shèn 洪深
1894–1955 Dramatist

A founder of the Chinese spoken drama (huaju 话剧), Hong Shen established the role of the Chinese director and a complete system for performing this new drama. His most important dramatic work is the play Yama Zhao (Zhao yanwang 赵阎王), which was influenced by Eugene O’Neill’s The Emperor Jones.

Hong Shen, together with Tian Han 田汉 and Ouyang Yuqian 欧阳于倩, was one of the founders of Chinese spoken drama (huaju 话剧), which greatly affected the nature of theatrical performances in China.

Born into a well-to-do gentry family in Jiangsu Province, Hong attended modern-style schools in Shanghai and the prestigious Qinghua University in Beijing. He developed an interest in drama through acting in school plays. His formal dramatic education began in 1919 at Harvard University, where he attended Professor George Baker’s play-production workshop and became the first Chinese to study Western drama. In his spare time he also performed with drama companies in Boston and New York. His U.S. training laid the foundation for his career in drama.

When Hong Shen returned to China in 1922, modern Chinese drama was still in its infancy, with only student-organized amateur theaters to replace the declining “civilized drama” (wenming 文明戏) of the previous decade. At the invitation of the Ouyang Yuqian, who had returned from Japan, Hong joined the Shanghai Drama Society and began his reform of the amateur theater. He required all performances to be based on a written script and instructed his actors to follow his detailed procedure for rehearsal. He also wanted to get rid of the old practice of female impersonation. His production of Hu Shi’s 胡适 play The Greatest Event in Life (Zhongshen dashi 终身大事) in 1923 marked the first time men and women acted on the same stage in China. His adaptation and production of Oscar Wilde’s Lady Windermere’s Fan the next year established a complete system for dramatic performance and introduced the role of the director in Chinese drama. His many writings on the theories and practices of drama and film laid a theoretical foundation for these performing arts. He also changed the name of “new drama” to “spoken drama” to emphasize the importance of dialogue in a play. This focus improved the literary quality of plays in China.

Hong Shen’s most important dramatic work is the play Yama Zhao (Zhao Yanwang 赵阎王, 1922), in which he exposes the brutalizing effect of the wars among the warlords on the common people. Modeled on U.S. playwright Eugene O’Neill’s The Emperor Jones, the play employs expressionist techniques to explore the protagonist’s psychology. It also expresses Hong’s belief that evil is not inherent in the human nature but rather is a result of social forces. The central character’s transformation from an honest peasant into a murderer, or King of Hell (Yama), is due to his dehumanizing environment. He is both a victim and a victimizer.

In the 1930s, he joined the League of Left Wing Writers, and his Shanghai Drama Society adopted the slogan of “proletarian drama.” His representative works during this period were the three plays in his “village trilogy” (nongcun sanbuqu 农村三部曲), which describe the dire conditions in the countryside and the social causes of rural poverty. These plays reflected his belief that playwrights should do
something beneficial for society, but in doing so he fell into the trap of using drama to preach political doctrines.

During the War of Resistance against Japan (1937–1945, known outside China as the Second Sino-Japanese War) Hong promoted "drama for national defense." He wrote many patriotic plays and was active in organizing traveling troupes to spread the message of resistance against Japan. After the founding of the People’s Republic of China (1949), his many official duties prevented him from doing dramatic work, except the play *This Is the American Way of Life* (*Zhe jiushi Meiguo de shenghuo fangshi* 这就是“美国的生活方式”), which he wrote to show his support for the Korean War. As a founder of Chinese spoken drama, Hong Shen followed the development of this drama from the pluralistic 1920s, when romanticism, expressionism, and Ibsenian realism coexisted, to the politicized theater after the 1930s.

Tourism in Hongcun Village

Tourism has become a major source of revenue for many towns in China, making historic buildings, traditional festivals, and local legends of new commercial value. This text comes from a tourist information website:

Stunning delicate woodcarvings were engraved on the beams above the front lounge of the Chenzhi Hall, the house of Qing Dynasty (1644–1911) salt dealer Wang Dinggui in Hongcun Village. One depicts dozens of playful children celebrating the Lantern Festival by setting off firecrackers, beating drums and gongs or blowing trumpets. Another portrays dozens officials playing stringed musical instruments, painting or doing calligraphy at four tables. Barbers and tea servants are shown working behind them. The memorial archway—built in 1578 and dedicated to Hu Wenguang, a Xidi native who became a high official of the Ming Dynasty—is a masterpiece of stone carving. The best brick carving ever in Xiyuan, or west garden, at the house of another prominent Ming-dynasty official from Xidi. The pine, bamboo, plum blossom and rocks look real. The 13 stone pillars on the north end of the pond are said to be the guardians of the village.

Hongkong and Shanghai Banking Corporation (HSBC)

Xiānggǎng-Shànghǎi Huìfēng Yínháng
香港上海汇丰银行

The Hongkong (spelled as one word) and Shanghai Banking Corporation has been a leading foreign bank in China since 1865. HSBC was a quasi-official bank during the later Qing dynasty and lent money to the Qing government for political indemnities, national railways, and military campaigns by using China’s customs revenues as collateral. HSBC is rebuilding its network following China’s banking reform in recent decades.

The Hong Kong and Shanghai Banking Corporation (HSBC) was established in Hong Kong in 1865 by a group of shipping companies, led by Thomas Sutherland of the Peninsular & Oriental Steamship Company and Francis Chomley of Dent & Company. The new bank (which spells Hongkong as one word) sought to combine banking with the tremendous business opportunities in trade and shipping between Hong Kong and Shanghai.

HSBC established its Shanghai branch on 3 April 1865, with the Chinese characters of the words Huìfēng Yínháng, meaning “abundant remittances.” David MacLean, the first branch manager, had a close friendship with Robert Hart, inspector-general of Imperial Maritime Customs of China. Subsequently, Imperial Maritime Customs deposited all its revenues with the HSBC, and the bank established branches where Imperial Maritime Customs had local offices.

HSBC became a quasi-official bank in modern China, primarily because of the fact that the decaying Qing dynasty (1644–1912) government had no official bank before the end of the nineteenth century. The Qing government frequently borrowed money from the bank for political indemnities, national railways, and even for military campaigns by using customs revenues as earnest money or as collateral. As the most important and influential foreign bank, the Hongkong and Shanghai Banking Corporation issued its bank notes in various denominations in China. Acting as a proxy for the Chinese government in banking and finance, the bank utilized access to London’s financial markets to sell bond certificates. Its foreign exchange transactions often accounted for 60 to 70 percent of total daily transactions in Shanghai financial markets. For more than a half century China’s financial markets set their daily foreign exchange rates based on Shanghai, and the Shanghai interest rates were set by the Hongkong and Shanghai Banking Corporation.

During the Pacific War (1941–1945) HSBC was forced by the Japanese military to suspend business. After the establishment of the People’s Republic of China in 1949, only the Shanghai branch remained, and its role was limited to inward remittance and export bills until economic reform in 1978.

HSBC began building its new network in China in the 1980s, establishing branches in major cities and quickly becoming the largest foreign bank in China.
1991 HSBC Holdings was established to act as a parent company to HSBC Group, and in 2000 HSBC moved its China headquarters from Hong Kong to Shanghai. Currently the headquarters is located in its own HSBC Tower in Pudong. From 2001 to 2004 HSBC acted as a strategic partner to obtain a 19.9 percent stake of the Bank of Communications and about an 8 percent stake in the Bank of Shanghai. In February 2007 HSBC applied for its license from the Chinese Banking Regulatory Committee to become a registered foreign bank in China.

Hongze Lake

Hongze Hú 洪泽湖

Hongze Lake is China’s fourth-largest freshwater lake. Located in the Huai River valley, Jiangsu Province, it is an important stopover site and winter habitat for many species of migratory birds. Hongze is also renowned for its aquaculture products.

Hongze (vast marsh) Lake, China’s fourth-largest freshwater lake, is located in the Huai River valley in the western part of Jiangsu Province in eastern China. The lake covers an area of 2,069 square kilometers; the deepest spot in the lake is 5.5 meters, and the surface elevation is 12.25 meters above sea level. Of several rivers flowing into the lake from the west the largest is the Huai, which continues south to join the Yangzi (Chang) River.

The lake assumed its present size in 1194 when the Huang (Yellow) River changed course and no longer provided an outlet for the Huai River, which flowed into Hongze Lake instead. With no other natural outlet the Huai River frequently flooded the lake and the surrounding area, and canals were dug linking Hongze Lake to the Grand Canal, which runs north-south on the plains 20 kilometers to the east. A canal also connects the lake to the East China Sea 160 kilometers to the east. Dams, sluice locks, and embankments have been constructed to control floods and permit the rivers to replenish the water table of the lake. The largest dam, the Sanhe Dam (three rivers), is located where the Huai flows into Hongze Lake. Along the eastern shore is a 67-kilometer-long stone embankment. The fields of the coastal plains of Jiangsu Province are irrigated with water from Hongze Lake, and the lake is used for hydropower generation.

Because of its location in a transition zone between a warm temperate and a subtropical climate, the lake is rich in aquatic plants and animals and is one of China’s principal lakes for freshwater fish farming. Aquaculture products farmed for domestic use and export include whitebait, perch, eel, Chinese mitten crab, and shrimps as well as water chestnuts and lotus. Hongze Lake is an important stopover site and winter habitat for 143 species
of migratory birds, nine of which, such as the red-crested crane, the gray crane, and the great bustard, are protected by an international convention signed by China. In 2006 the Chinese State Counsel approved the Hongze Lake Wetland National Nature Reserve in Sihong, which covers 16.7 square kilometers of the northwestern shore. The Hongze Lake area is also home to some oil activity, which is a danger to the environment. In 2003 the Huai River flooded the lake, and more than 250 oil wells were waterlogged. A new threat to the environment was added during a drought in 2000–2001 when the water table of Hongze Lake dropped drastically. The western part of the lake became unnavigable as the water table dropped by 2 centimeters a day for a prolonged period of time.

Today Hongze Lake has become a tourist attraction because of its scenery and seafood; the latter attracts many visitors to the annual Golden Autumn Crab Gourmet Festival.

The objective of the Johns Hopkins–Nanjing University Center for Chinese and American Studies (known as the Hopkins–Nanjing Center) is to foster mutual understanding and appreciation between China and the West, and to train students with an interest in becoming leaders in Sino-Western relations. It is the only joint-university program of its type in China.

The Johns Hopkins University–Nanjing University Center for Chinese and American Studies (known as the Hopkins–Nanjing Center) was established in 1986 by then–Johns Hopkins University president Steven Muller and then–Nanjing University president Kuang Yaming. Its mission is to train future leaders involved in Sino-Western relations and to improve mutual understanding and relations between China and the West by bringing people together for a period of intense exposure to each other’s history, culture, contemporary thought, and society.

The Hopkins–Nanjing Center for Chinese and American Studies is housed on the campus of Nanjing University in Nanjing, China. The program is operated jointly by Nanjing University and the Johns Hopkins University Paul H. Nitze School of Advanced International Studies (SAIS) in Washington, D.C.

President Muller first envisioned the center back in 1977. SAIS already had a track record of success with its international program and with its graduate school in Bologna, Italy. Muller wanted to replicate that success in Asia, and realized that China was “the country of the future” (Rienzi 2007). He foresaw the need to establish a positive relationship between the U.S. and China.

It would be a few years before Muller’s vision became a reality, but in 1981, when a delegation of Chinese university presidents visited the campus of Johns Hopkins, Muller met Kuang Yaming, and the Hopkins–Nanjing Center was born.

The Center officially opened in 1986 with twelve international students and forty Chinese students enrolling that first year. Since then it has grown to become the largest institution dedicated solely to training future leaders of Sino-American relations, with a total enrollment of 140 students in 2008.

Each year, around seventy postgraduate Chinese students go to the Center to study in English about the United States, economics, and international affairs. They are taught at the Center by faculty hired from American universities by the Johns Hopkins University. At the same time, around seventy students from outside China, most of whom are American, study in Chinese from the Chinese faculty of Nanjing University. They learn about contemporary Chinese politics, economic development, social changes, and the underlying cultural issues affecting contemporary China. Students can work toward either a one-year certificate in Chinese and American studies or a two-year Master of Arts in International Studies.

The two groups of students live together at the Center’s dormitory. Usually, Chinese and non-Chinese students are paired as roommates so they can learn from each other and explore differences in culture and language. In addition, all students have access to a bilingual, open-stack library with about 65,000 volumes. The Center also
hosts seminars, lectures, and extracurricular activities aimed at offering opportunities to learn more about each other’s society and culture.

The Center currently boasts over 1,700 graduates now working in such fields as business, journalism, government positions, and academia. It is the only accredited academic program in both China and the United States that offers a master’s degree.

Hou Debang, a chemical engineer committed to the industrial development of China, established a reputation by creating a way to eliminate calcium chloride as a waste product. This technique, called the Hou process, along with his work with the Ministry of Chemical Industries and China’s Society for Chemical Industries, has left a lasting impression on the chemical engineering business in China.

Hou Debang was born in 1890 to a farmer’s family in Changsha, a village outside Fuzhou (the capital of Fujian Province, on China’s east coast). From 1903 to 1906 he studied at the Anglo-Chinese College, a school sponsored by the American Methodist Episcopal Mission. Expelled for his participation in the Anti-American Boycott of 1905, he attended Chen Baochen’s Quanmin xuetang (Fujian Academy) before enrolling at the Fujian-Anhui Railroad School in Shanghai. After graduation in 1910 he spent three months as an engineer apprentice before being admitted to the Qinghua preparatory academy for studies in the United States. From 1913 to 1916 he attended Massachusetts Institute of Technology on a scholarship, majoring in chemical engineering. After graduation he attended Pratt Institute in Brooklyn for a certificate in chemical tanning. He graduated from New York’s Columbia University with a dissertation on iron tannage in 1921.

Before Hou had obtained his doctorate, he already had begun a lifelong association with Fan Rui’s Pacific Alkali Co. (Yongli Chemical Industries, founded 1917). Although W. D. Mount, a retired engineer, had sold Fan a set of plant plans, unraveling the Solvay process (a process for making soda from common salt) proved daunting. Returning to China in 1922, Hou was appointed chief engineer and spent the next three years preparing the plant for commissioning. Regular production began in 1926, with Hou and Li Zhuchen rotating as plant manager. In 1931 Hou took leave from the company to share his expertise with the world by publishing a practical treatise on the manufacture of soda. In 1934 Hou Debang was dispatched by Fan Xudong to New York to undertake another major project: design and purchase equipment for an ammonia sulfate plant in Nanjing. With the help of the Nitrogen Engineering Corporation and the Wah Chang Trading Corp., Hou completed the tasks, and the new plant began production three years later.

World War II, however, interrupted Hou’s work. He was evacuated to Sichuan Province in 1938 and found a new challenge in adapting the Solvay process to local conditions. He left for Europe and the United States in 1939 to develop a new approach and to procure equipment for Yongli’s new plant in Sichuan. The result was the Hou process, which eliminated calcium chloride as a waste product and created a by-product, ammonium chloride, used as a fertilizer. His reputation established, Tata Industries in India retained him as chief consulting engineer for its soda ash plant from 1947 to 1949.

Hou, however, remained committed to China’s industrial development. After Fan Xudong’s death, he became general manager of Yongli and steered it through the turbulent civil war years. In 1950, together with Li Duchen, he proposed
to place Yongli Chemical Industries and Jiuda Salt Industries under joint state-private management, thus launching the socialist campaign to transform capitalist enterprises in heavy industries. He was reappointed general manager of the new enterprise in 1952 and served until his departure for the Ministry of Chemical Industries in 1958. Continuing work on his Hou process, he also served as the executive director of China’s Society for Chemical Industries until his death in Beijing.

The household responsibility system is an essential component of the agricultural reform initiated by China in the late 1970s. Under the system, land or certain tasks are contracted to individual households for a period of time. After fulfilling the procurement quota obligations to the state, farmers are free to keep their surplus for their use or sell it on the market.

Having transformed China’s countryside into a system of agricultural cooperatives by 1957 (the process called collectivization), the Chinese leadership moved on in 1958 to more ambitious programs of the Great Leap Forward. Existing collectives were soon organized into people’s communes, much larger units with an average of about 20,000 to 30,000 members. Communes as a basic organization of the Chinese countryside remained until late 1970s when reform impulses began to pop up in various places. The household responsibility system (jiating chengbao zeren zhi) was one of the agricultural reforms that emerged at the time. Although forbidden by the central government until the autumn of 1980, the household responsibility system was introduced experimentally in rural China, most famously in Anhui Province.

The household responsibility system had two major forms. The first involved contracting output to the household (baochan daohu); the second involved contracting everything to the household, or contracting tasks to the household (baogan daohu). Under both forms the collective retained the ownership of the land. Under the form of contracting output to the household, land was divided equally and then leased to individual peasant households on a per capita basis for the return of a certain kind or amount of yield as specified by the contract to the state. Peasant households had the autonomy to decide what and how much to produce. Any surplus beyond the fixed quota would be kept by peasant households either for their own consumption or for sale in the newly liberalized rural markets.

Under the form of contracting everything to the household certain plots of land were assigned to individual households in return for fixed payments to the collective as procurement quotas, taxes, welfare funds, and collective investments. The household would keep anything else for its own use or for sale.

The terms of household contracts varied in different areas. Initially some areas used annually renewed contracts that reallocated land to allow for changes in a household’s size or situation. In other areas the duration of the contract was not clearly stipulated but was assumed to be long term. In the latter, land allocations were to remain unchanged regardless of household situations such as births or deaths. Over time the system gradually evolved into explicit long-term leases of land under collective ownership. The government even began to grant land-use certificates through county offices that would be good for fifteen to twenty years. Eventually the government extended leases to fifty years on land that could be inherited and sublet.

The essential feature of various forms of the responsibility system was the establishment of a direct and
effective link between work and rewards. The system did not change the nature of collective ownership of land and property, but it did change the way the land and property were used and the way agricultural production was managed. The work-point system that had been in place since collectivization was gradually replaced by various forms of the responsibility system.

Early forms of the household responsibility system were introduced in response to excesses of the crash collectivization movement in the mid-1950s. But this endeavor was quickly reversed with Chinese Communist Party leader Mao Zedong’s intervention. Accused as “rightist opportunism,” these nascent experiments were soon submerged in the waves of “agrarian radicalism” during the Great Leap Forward and the Cultural Revolution (1966–1976). Their revival came in the late 1970s in response to initiatives taken by the farmers and local governments.

Experiments with various responsibility systems in the late 1970s started in Anhui Province when Wan Li was appointed provincial party secretary. In November 1977 the provincial government began to liberalize the rural economy with the passage of a policy known as the “Six Articles,” which called on officials at various levels to respect local units’ autonomy. In 1978, when a severe drought hit Anhui, with the endorsement of the provincial government Shannan District in Feixi County began the practice of “lending” pieces of land that were not used by the collectives to peasant households.

With the benign neglect and implicit support of some reform-oriented regional and local leaders such as Wan Li, other localities in Anhui began experimenting with various forms of the responsibility system. These experiments included contracting output to groups (bochan daozu), contracting tasks to groups (boagan daozu), contracting output to the household, and contracting tasks to the household. These forms of the responsibility system calculated rewards based on yields and distributed bonuses for output over quotas (lianchan jichou and chaobao jiangli). For example, in 1978 Xinjie Commune in Tianchang County adopted a limited version of household contracting by fixing output responsibility.

Farmers cart their produce to sell at market. Because farmers are now allowed to sell their surplus crops after government quotas are fulfilled, incentive is a factor in China’s reformed agricultural system. Photo by Joan Lebold Cohen.
for certain crops such as cotton to individuals (in reality, households). In the spring of 1978 Mahu Commune in Fengyang County and Weiyang Production Team in Lai’an County began linking production and reward via contracting output to groups or contacting everything to groups (da baogan daozu). At about the same time in Xiaogang, Fengyang County, eighteen peasant households secretly began practicing the household responsibility system. Given the political uncertainty at the time, they signed a pledge in the spring of 1978 to take care of the dependents of team cadres in case they were arrested for allowing such a practice.

**Contracting Spreads**

Although Fengyang County later reversed its decision to permit the household responsibility system when other areas demanded the same right, its initial endorsement emboldened residents in other localities, and household contracting began to spread even though this practice was often concealed from higher authorities. By the time of the Third Plenum of the Eleventh Central Committee in December 1978, over one thousand production teams had already adopted the household responsibility system.

Although the Third Plenum reaffirmed the Dazhai model, a brigade widely heralded during the Cultural Revolution for its spirit of hard struggle and self-reliance, it also encouraged experimentation with various forms of the responsibility system that linked work with pay under unified accounting and distribution by the collective. More important, while the Third Plenum still forbade the adoption of the household responsibility system, the fact that it tolerated the development of different forms of the responsibility system was a sign of relaxation. In such an atmosphere responsibility systems in the form of contracting output to small groups and even contracting output to households were soon adopted in various places, especially in remote and poor areas. Although not all of the practices were sanctioned, none was really punished or banned. Therefore, well before the central government permitted the practice of group and, later, household responsibility in agriculture, various localities had already adopted them secretly.

But the household responsibility system continued to face strong opposition, and in most provinces the responsibility system was still limited to contracting to small groups, not households. Even Xiaogang was among the first to adopt the household responsibility system, it was forced by county authorities to switch to small-group responsibility in 1979 because of complaints from neighboring brigades and communes.

While the general atmosphere during this period was favorable to various experiments of agricultural reforms, it was not until 25–28 September 1979 at the Fourth Plenum of the Eleventh Central Committee did
the official policy regarding the household responsibility system began to relax. Although contracting output to households was still prohibited, it was allowed with the exception of certain sideline productions with special needs and isolated households living in remote poor areas.

Even this limited opening to allow households in poor remote areas to contract land in certain sideline productions became a window of opportunity for those looking for change. By late 1979 contracting output to households quickly spread. According to the economist D. L. Yang (1996), 25 percent of rural households were already engaged in output contracting in the spring of 1980. By July–August of the same year the number increased to 30 percent. In Anhui production teams practicing household contracting grew from less than 1 percent in 1978 to 16 percent in 1979 and 90 percent in 1980. The rapid expansion of the household responsibility system was due largely to the permissive attitude and even support from reform-minded regional and local leaders such as Wan Li in Anhui and Zhao Ziyang in Sichuan. Wan Li openly defended the practice of the household responsibility system as simply one form of responsibility system and it was socialist because the land still belonged to the collective.

Despite the much-improved political atmosphere, rural reform, and especially the household responsibility system, still faced strong opposition. Even in Anhui, the most radical of China’s provinces, the household responsibility system was still not widely accepted. Although Feixi County had adopted the system from the beginning, most of Anhui had adopted the alternative system of contracting to small groups. In Fengyang County, which became famous for pioneering the system of contracting to small groups, the party leader gave his support only to contracting output to small groups but opposed the adoption of the household responsibility system. As noted earlier, the county authorities who had originally allowed Xiaogang to adopt the household responsibility system reversed their decision when Xiaogang’s example came into conflict with the policy of contracting to small groups in nearby areas. Although the leadership at the prefecture level in Chuxian supported the more radical household responsibility system, resistance from local cadres, especially at the county level, persisted.

From Permitted to Popular

During the next two years the first tentative endorsement of the household responsibility system was gradually extended, and the corresponding increases in grain production helped alter attitudes toward the system. The subsequent policy changes evolved from permitting the household responsibility system to recognizing and then popularizing it. This change was due largely to Chinese Communist Party leader Deng Xiaoping’s endorsement and Wang Li’s open support after he became vice premier in charge of agricultural affairs and head of the State Agricultural Commission.

Even in 1980 at a meeting of provincial party secretaries most provinces still opposed the household responsibility system. However, a major breakthrough occurred at a meeting of provincial party secretaries on 14–22 September. With strong support from Wan Li, the meeting issued a resolution on “Certain Problems with Respect to Further Strengthening and Improving Responsibility System for Agricultural Production,” known as “Document No. 75.” Despite continued opposition from some provinces at the meeting, this document endorsed the experiment of various forms of responsibility system, including the continued practice of the household responsibility system even in some prosperous areas that had already adopted it.

At the time of this meeting an estimated 20 to 30 percent of all production teams had already adopted the household responsibility system despite continued opposition. In the aftermath of the release of the document most provinces and autonomous regions responded promptly and positively, and subsequently various forms of the responsibility system developed quickly. Apart from contracting output to small groups and contracting output to households, many places began dividing labor according to specialization and linking rewards to yields (zhuanye chengbao, lianchan jichou). At the same time restrictions on rural markets and fairs were further eased, and measures were also taken to encourage crop diversification, specialization, and production for expanding internal and external markets. Most important, by July 1981 many basic accounting units in rural China had adopted some form of the household responsibility system even though the document stipulated that “average areas should not adopt” this system.
A variety of responsibility systems was used in different regions. More-developed regions along the coast preferred some form of specialized contracting. The poorest and least-commercialized areas in the interior would find the household responsibility system most appropriate. Regions in the middle would tend to adopt a hybrid system of the two. By this time most people still viewed contracting output to individual households as an effective way to raise rural income levels because it could alter the incentive structures in the “backward” areas where the collective economy was weak and ineffective. But suspicion and even opposition to its adoption in more prosperous regions persisted.

By the time of the National Rural Work Conference on 5–21 October 1981 about half of the production teams had already adopted the household responsibility system and divided up team property. The household responsibility system gained legitimacy at the conference when it was formally recognized as a form of socialist collective economy. This policy shift was reaffirmed by the CCP Secretariat the next month.

The Chinese political system has an inherent tendency to swing between extremes. Although there was still some resistance to adoption of the household responsibility system, resistance soon collapsed after the system was endorsed and pushed from above. Like the socialist high tide during the collectivization movement, party apparatus at various levels again lapsed into rigidity after an initial flirtation with experimental innovations and local flexibility.

With the promulgation of Document No. 1 of 1982, rural reform became unstoppable. Despite the government intention for a period to slow down the new system and reflect, stabilize, and improve on it, the momentum toward household contracting was so strong that the household responsibility system was accelerated. Within a year production teams that had already adopted some form of the household responsibility system increased from about 50 percent of the total in 1981 to about 80 percent in 1982.

The effect of the adoption of the household responsibility system was remarkable. By the time of the Rural Work Conference in November 1982, there were dramatic increases in the production of grain, cotton, and oil crops. Consequently the household responsibility system was reaffirmed in January 1983 by Document No. 1. This reaffirmation led to further acceleration in the pace of decollectivization. Rural households engaged in the household responsibility system jumped to 98 percent of the total in 1983 and 99 percent in 1984.

**Litmus Test**

After the central authorities accepted the household responsibility system, implementation of the system soon became the litmus test in many areas of a cadre’s support for reform despite government calls for selective adoption of the system where the collective had failed. Most cadres, skilled at sniffing shifts in the political wind, quickly jumped on the bandwagon of reform. Those that did not were subjected to political pressure by 1982. Although adoption of the household responsibility system was to be originally voluntary and based on peasants’ “democratic decisions” in regions where it was suitable, primarily in the poorer and remote rural areas where collectivized farming had failed, the system soon became mandatory throughout China.

Implementation of the household responsibility system was further facilitated by the dismantling of the commune system in 1984. In accordance with a state constitution adopted in December 1982, the political and administrative authority of the people’s communes was transferred to township (xiang) governments. The central government required that separation of the government administration from economic management be competed throughout China by the end of 1984. The separation of the government administration from economic management, along with the establishment of xiang governments, was a major institutional reform in rural areas in the early 1980s, and these changes made the individual peasant household the main unit of production and management.

Thus, the initial changes in the form of production since 1978 in rural China soon turned into a new high tide of decollectivization. In this sweeping process of change the old commune system was replaced by the new household responsibility system based on individual family farming. By 1984 most villages divided their land and collective properties; even villages that never divided their land and collective properties were pressured to adopt various forms of the responsibility system and make necessary adjustments.
Adoption of the household responsibility system—together with rising procurement prices, increased supplies, use of farm inputs such as chemical fertilizer, and revival of rural markets—produced spectacular growth in agricultural output and in peasant standards of living. With growth in the agricultural sector exceeding that of the industrial sector, the urban-rural income gap declined for the first time. Consequently peasant demand for consumer goods mushroomed, providing strong market support for increased production in the light industrial sector.

**Peasants Lose Confidence**

But the limitation of the household responsibility system soon began to manifest itself. Lack of explicit ownership rights of land and the initial short-term lease undermined peasant confidence in the durability of the contracts and prompted peasants to engage in short-term economic behavior. Critics were also concerned that the household responsibility system seriously depleted public assets such as draft animals, farming tools, and machinery. A more serious consequence of decollectivization is that many of the collectives’ functions began to lapse. This lapse could be seen in the deteriorating conditions of flood control, irrigation projects, and the provision of basic public goods. More important, as stimulus effects from institutional change began to taper off after 1984, growth of agriculture became sluggish.

In response the government introduced long-term leases of collective land to peasant households. These long-term leases were expected to provide a means of re-establishing all the incentives of family farming without turning all the land over to direct private ownership.

The rapid growth in productivity resulting from all these institutional changes has ushered in a period of great transformation in rural China. The surplus labor created by increased productivity, together with the easing of travel and residence restrictions, has led to massive
rural migration. Many have abandoned tilling the land and found employment in village and township enterprises. More have become migrant workers, seeking jobs and even permanent residence in cities and, in the process, fueling rapid urbanization in China.

China changes constantly, and the Encyclopedia of China will change and grow, too. Berkshire’s authors and editors welcome questions, comments, and corrections: china.updates@berkshirepublishing.com.
“Butterfly” Hu was the most famous Chinese actress of the silent and early sound era. Like many contemporaries, she performed under a stage name, which followed her throughout a career that spanned four decades. Once an official representative of China’s film industry under the Nationalist Party, she founded her own production company before retiring in 1967.

Known during the 1930s as China’s “Film Queen,” “Butterfly” Hu’s personal name was Ruihua and her father a high-ranking customs inspector for the Beijing-Fengtian Railway. Moving with her family from Shanghai to numerous cities in northern China allowed Hu to acquire fluency in several Chinese dialects. Although a film actress from 1925 onward, these linguistic abilities proved extremely valuable in aiding Hu to successfully make the transition from silent films to “talkies.” She starred in the Shanghai film industry’s first partial-sound production (the film was recorded with a complete soundtrack, but this was played back on a separate disk which accompanied the feature), The Singing Girl Red Peony (1931), which also made her a figure in the burgeoning world of mass-produced popular music.

Hu Die entered the Zhonghua Film Academy in 1924. A year later, she appeared in her first film, Victory (1925), and steadily built a career as an actress for studios such as Youlian and Tianyi. During this early period Hu distinguished herself in both “modern” roles (wife, movie star) and those depicting mytho-historical female icons (Meng Jiangnū, Madame White Snake, Zhu Yingtai, all of which are exemplary though “doomed” lovers in classical Chinese oral tradition and fiction). In 1928 she parlayed this success into a high-paying contract with the

Hu Die (1907–1989). “Butterfly,” as she was known to her adoring fans, reached won great acclaim for playing a pair of estranged twins.
Mingxing (Star) Film Company, whose veteran directors Zhang Shichuan and Zheng Zhengqiu abetted her rise by casting her as the female lead in the long-running serial *Burning of the Red Lotus Temple* (1928–1931), along with numerous other high-profile Mingxing productions.

As cinema became an increasingly widespread urban phenomenon during the 1930s, Hu Die’s commercial successes brought her undeniable fame. Her performance as a pair of estranged twins in *Twin Sisters* (1934) was received as a marvel of both artistic and technological prowess in Chinese cinema at the time, and still considered an example of Hu at the peak of her acting powers. She appeared in the films of highly-regarded scriptwriters and directors, including relatively popular “leftist” social features such as *Wild Torrents, Salt Tide, and Cosmetics Market*, all released in 1933. This year also marked Hu’s ascension to the title of “Film Queen” (yìng hòu), chosen by readers of the popular tabloid *Mingxing Daily* poll. The Oscars-like event constituted a victory of sorts over Hu’s chief rival, former Mingxing Film Company actress and Lianhua (United) Film Company silent film star Ruan Lingyu. In 1935 Hu attended the Moscow and Berlin international film festivals as a representative of the Chinese film industry, and had her impressions of the trip published in numerous newspapers, magazines, and journals. That same year, subjected to increasing media scrutiny as a result of her failing marriage, Hu’s rival Ruan committed suicide.

Hu’s own career was not without controversy. The press published critical pieces concerning her ambiguous marital status, and questioned her devotion to her country. During the early 1940s she was pressured by the powerful Chinese secret service “spymaster,” Dai Li, to become his mistress. Their relationship did not end until Dai’s death in 1946.

War between China and Japan dramatically transformed Hu Die’s life and career in many ways. In 1937 she fled to Hong Kong and continued making movies until 1941, when Japanese invasion of the colony forced her to relocate to the hinterland “Free China” capital of Chongqing. Hu continued to act until the 1960s, appearing in several features while briefly running her own studio; her filmography includes over ninety titles. Ultimately retiring to Canada, Hu Die’s autobiography was published by numerous Chinese-language presses during the late 1980s, a testament to her popularity as the emblem of several remarkable eras in film history.

Hu Jintao is the current President of the People’s Republic of China. During his two terms in office he has faced several crises, with varying degrees of success. His handling of the 2008 Sichuan earthquake was initially praised for his break from previous government secrecy but later criticized outside China after widespread media censorship of the event became apparent. He has been very active in promoting development at home and improving foreign relations, notably with Taiwan.

Born in Shanghai in December 1942, with ancestral roots in Anhui Province, Hu Jintao graduated in 1965 from China’s Qinghua University, Department of Irrigation Engineering. He joined the Chinese Communist Party (CCP) in April 1964 and became a political/ideological counselor for students while in college. After graduation, Hu worked as an engineer at the Liujiaxia Irrigation Works in Gansu Province, northwestern China.

Chosen by Paramount Leader Deng Xiaoping (1904–1997) to be a leader of the so-called fourth generation of leadership of the People’s Republic of China (PRC), Hu was ranked as the fifth and the youngest standing member of the seven-member Political Bureau of the CCP during Jiang Zemin’s era (1989–2002) and succeeded Jiang in 2002. He had been head of the Chinese Communist Youth League (January 1983–July 1985), party secretary of Guizhou Province (July 1985–November 1988), and the party secretary of the Tibet Autonomous Region (December 1988–January 1991). Currently Hu serves as president of the PRC, as well as general secretary of CCP’s Central Committee, and chairman of the CCP’s Military Affairs Committee.

Since his succession to Jiang Zemin, Hu Jintao has taken an active role in developing China’s foreign relations. The first developments were the introduction of the concepts “harmonious society” and “peaceful rise,” the latter of which was proposed in 2003 by Chairman of the China Reform Forum Zheng Bijian. Peaceful rise, later termed the peaceful development path by Hu, was touted as a path of economic development that could raise “China’s population out of a state of underdevelopment” (Glaser & Medeiros 2007, 295) while working cooperatively with other countries to promote national security and world peace. The concept of peaceful development also included Cross-Strait relations between Taiwan and the mainland. In 2006, Hu stated that China’s foreign policy would include a peaceful approach to the Taiwan issue. As a result of this goal, which was developed via consultations with the United States, tensions between the Mainland and Taiwan lessened, and economic and agricultural cooperation improved. This was helped by the election of the more conciliatory Guomindang (Kuomintang, [KMT]) under Ma Ying-Jiao in the Taiwanese Presidential elections in 2008.

These socioeconomic developments were evidence of Hu’s philosophy of a “harmonious society” that places people at the center of policy decisions and debates. At the Seventeenth National Congress of the CCP in October
2007, Hu asserted that China’s primary goal was to become “a well-off society that would ensure balanced economic growth, improvement of people’s well being and social justice” (Jianhai Bi 2008, 17). This goal included dispersing China’s wealth by retooling income distribution policies and balancing growth between rural and urban areas. Hu’s focus on government for the people exemplified his ideology, which was based expressly on Jiang Zemin’s “Three Represents,” a guiding belief system that centered on learning, politics, and integrity. This ideology was not without its critics, however, who claimed that Hu’s rhetoric about the administration working for the people’s best interests allowed him to impose his own agenda. Such claims were not uncommon or far-fetched given the corruption scandals of Communist leaders since the 1980s.

Throughout Hu’s term as president there was an increase in anti-corruption campaigns, but top officials remained beyond investigation, which became problematic during times of national crises when information was not

Hu Jintao inspecting the honor guard in Nairobi, Kenya. China is actively trying to expand its relationships with sub-Saharan African governments.
communicated and governmental activity was not transparent. During the SARS outbreak in 2003, official announcements were slow to materialize and numerous cases went unreported by hospitals and health officials. This crisis provided Hu and his administration with the opportunity to make policy changes, particularly with regard to accountability of governmental officials and to media ownership. Significant changes, however, were slow to materialize. Instead, the opportunity was used primarily to legitimize the CCP and bolster Hu’s position therein.

Unlike during the SARS crisis of 2003, Hu’s administration was praised by the international community for its rescue and relief efforts and for its initially allowed open reporting of the Sichuan earthquake in May 2008, which left nearly 80,000 dead or missing. This praise was short lived, however, as reports began to surface of thousands of schools collapsing because of poor construction. State-controlled media censored reports about the school collapses amidst protests from parents and teachers, some of whom were detained. In early 2009, reports speculated that the earthquake might have been induced by the 320 million tons of water held back by the four-year-old Zipingpu Reservoir, a government sponsored project that was meant to provide power and water for drinking and irrigation to the Sichuan region.

China under Hu experienced continuing strong economic growth. In 2007, the beginning of Hu’s second five-year term, the trade surplus with the US and the EU exceeded $260 billion and foreign reserves moved to a record $2 trillion at the end of 2008. Hu expanded foreign interests, paying visits to the United States, the Middle East, Africa, and Europe to propagate his ideas of China’s peaceful rise and harmonious society. Economic progress was one of the top priorities of Hu’s administration, the focus of which was on developing global industry and advancing Chinese brands.

During his second tenure as President of China, the 29th Olympic Games was held in Beijing, China, during the summer of 2008, bringing unprecedented attention to the People’s Republic. Hu is due to be replaced as President and Party Secretary in 2012.

HU Shi
Hú Shì 胡适
1891–1962  New Culture Movement leader

Hu Shi was a leader of the early twentieth century New Culture Movement. Hu was known for his writings on language reform and literature revolution. Labeled as the leader who sought construction, not destruction, Hu Shi was criticized by conservatives and Communists alike for his efforts and views during the Movement.

Hu Shi, an educator and a major leader in the New Culture Movement, was born as Hu Hongxing in Shanghai in 1891. Hu Shi lost his father, a government official, when he was only three. Growing up in a family of declining fortune, Hu Shi witnessed the struggle of his mother, widowed at the age of twenty-two, in dealing with the irresponsible and insolent step-sons of her husband’s deceased former wife, quarrelsome daughters-in-law, and creditors who came to collect debt every New Year’s Eve. His mother’s self-restraint and resilience influenced Hu Shi to make pragmatic choices in both his personal life and public career.

Hu Shi’s education began in the Chinese tradition at age three, first under the tutelage of his father in Shanghai, then at a traditional school in his native county of Jixi in Anhui Province. In 1904 Hu Shi returned to Shanghai for education at so-called “modern” schools. He had his first exposure to vernacular writing at the China Public Institute, where he was an editor of a student periodical, Commitment Ten-Day Weekly (Jingye Xunbao), and tried his hand at writing fiction in the vernacular. He also had his first taste of student protest there when students demanded participation in drafting school regulations but were refused by the authorities and expelled from the school. After a brief period of teaching at a middle school, Hu Shi passed the national examination for the Boxer Indemnity Fellowship. In taking the examination, Hu took the name of “Shi” (to adapt), which carried a distinctive flavor of social Darwinism at the time. In 1910 he went to Cornell University on the fellowship and, at the advice of his brother, enrolled in the College of Agriculture. His interest in the humanities soon led him to transfer to philosophy. He was attracted to U.S.-style democracy when he observed the pre-election process in 1913, participated in public rallies, and gave many public lectures on Chinese affairs—at the cost of nearly failing his course. In 1914 he graduated with a bachelor’s degree and went to Columbia University to study philosophy with educator John Dewey, the leading advocate of pragmatism, an influential school in American thought of the twentieth century.

Hu began to participate in China’s New Culture Movement, a movement among intellectuals advocating a new Chinese culture based on Western-style (rather than Confucian) thought and ideals, while still a student in the United States. Between 1915 and 1916 he and a few other friends at Cornell and Harvard engaged in a debate on the use of the vernacular, as opposed to classical, in literature. “A Preliminary Discussion on Reform in Literature,” an article published in New Youth Magazine in 1917, was Hu Shi’s national debut in
the vernacular language movement, to be followed by more writings on language reform and literature revolution. In the same year Hu Shi returned to China, married Jiang Dongxiu, an illiterate girl betrothed to him through his mother’s arrangement when both were in their teens, and began teaching philosophy at the prestigious Beijing University. Hu’s approach to the history of Chinese philosophy was ridiculed by conservatives but instantly popular among students. He also joined the New Youth editorial board in 1918 and contributed regularly to the weekly.

Isms vs. Problems

In contrast to the political radical Chen Duxiu and cultural radical Qian Xuantong, Hu took moderate, pragmatic approaches to both politics and culture, arguing for the need of gradualism to attain revolutionary ends. His most well-known solutions were “less talk on isms, more discussion on problems” in his 1919 rejoinder to Li Dazhao, the co-founder of the Chinese Communist Party, and “bold hypothesis, careful investigation” for scholarly research. Thus, Hu emerged among the leaders of the New Culture Movement as the one who sought construction, not destruction. He became a vocal advocate for the vernacular and wrote A History of Vernacular Literature for its historical justification; he researched the authorship of A Dream of Red Chamber and issues relating to several other important fictions and ancient works, such as The Water Margin and Journey to the West. Hu’s efforts raised the status of these vernacular fictions and made them canonized works in Chinese literature. His research method also influenced generations of scholars after him. Some of them, such as Gu Jiegang, Luo Ergang, Fu Sinian, and Yu Pingbo, became leaders in the study of Chinese history and literary history.

Hu Shi’s liberalism made him an uncomfortable ally of the National Government under the Guomindang but an even harsher critic of the Chinese Communists in the late 1920s. He opposed hasty confrontation with Japan when its aggressive expansion in China escalated after the Manchurian Incident in 1931. However, he turned away from what others viewed as appeasement after the War of Resistance against China (also known as the Second Sino-Japanese War) broke out in 1937 and supported resistance by offering himself to government service. In 1938 he accepted the mission to the United States and Europe as a semiofficial emissary seeking Western support of China’s war effort. Between 1939 and 1942 he was China’s ambassador to the United States. He stayed in the United States for the remaining years of the war and researched Annotation on the Book of Rivers by Li Daoyuan (d. 527) and the Qing dynasty (1644–1912) scholarship of the book. Hu returned to China in 1946 and was appointed chancellor of National Beijing University. In 1949, when the ruling Nationalist government collapsed on the mainland, Hu Shi went to the United States and was curator of the Gest Library at Princeton University between 1950 and 1952.
Caught in the Crossfire

Throughout his life Hu Shi was criticized by both the conservatives and the Communists alike for his radical influence in the New Culture Movement or for his pragmatism and gradualism. On the mainland Hu Shi was the target of a Communist ideological campaign in 1954 in which he was criticized for promoting John Dewey’s pragmatism movement. In the same year Hu accepted the presidency of Academia Sinica in Taipei, Taiwan. His appointment immediately provoked the publication of books in Taiwan that attacked him for causing the social and cultural disorientations in China that opened the way to the Communist revolution. Still presiding over Academia Sinica, Hu died in 1962. In the 1980s and 1990s, scholarly interest in Hu Shi revived on the mainland as volumes of monographs were published and his importance in history recognized.

**HU Yaobang**

Hú Yàobāng 胡耀邦

1915–1989 Chinese Communist Party leader

Hu Yaobang, Secretary-General of the Chinese Communist Party, was a liberal reformer. He was responsible for promoting and implementing Deng Xiaoping’s political idea of “socialism with Chinese characteristics” as well as for adopting capitalist elements to facilitate economic reform and the opening up China to the world. Hu was also responsible for reforming the party by establishing clear lines of authority and recruiting young members.

Born in Liuyang, Hunan Province, into a peasant family, Hu Yaobang joined the Chinese Communist Party (CCP) Youth League in 1929 at the age of fourteen while still attending school. In 1933 Hu became a CCP member and was transferred to the CCP’s soviet (an elected governmental council in a Communist country) in Ruijin, Jiangxi Province. As secretary-general of the central committee of the Youth League, Hu was responsible for organizing young people. His success captured the attention of CCP Chairman Mao Zedong, who personally recommended Hu to head the political section of the party-founded Anti-Japanese University. During the Chinese Civil War (1945–1949) Hu served as political commissioner in the Red Army in central and north China, working under Deng Xiaoping, who became the paramount leader after Mao’s death.

After the founding of the People’s Republic of China in 1949, Hu followed Deng to the southwest, heading the North Sichuan People’s Administrative Office. In mid-1952 Hu and Deng were transferred to Beijing. Hu was assigned to serve in the New Democratic Youth League, which later was renamed the “Chinese Communist Youth League,” first as secretary and then in 1957 as first secretary of the league’s central committee. In September 1956 Hu was elected to the CCP Central Committee. At age forty-one he was the youngest member. Hu served in Beijing until 1963, not only continuing his youth work at home but also leading a number of delegations to promote youth work among Communist and socialist countries.

In late 1964 Hu went to Hunan Province, where he stayed until June 1965. As the first secretary of the Chinese Communist Shaanxi Committee and concurrently second secretary of the CCP Northwest Bureau, Hu had as his chief task restoring the rural order that was severely dislocated by Mao’s Great Leap Forward (1958–1960).

In June 1965 Hu returned to Beijing for medical treatment. On 13 August 1966, Hu was relieved of all official posts simply because his ties with Deng made him the target of the Cultural Revolution (1966–1976). Hu was being accused of possessing “bourgeois” tendencies. During the Cultural Revolution Hu was sent to reeducation camps and subjected to frequent persecutions from Lin Biao and the Gang of Four.

Mao’s death in September 1976 ended the Cultural Revolution. Deng was reinstated as vice premier and brought Hu back in 1977 as the head of the Central
Organization of the CCP. After Deng's leading role was confirmed in late 1978, Deng rapidly filled in the key positions with his aides. In 1980 Hu was made secretary-general of the CCP, a post that Deng previously held in 1954 but left vacant in 1957. The next year Hu concurrently took over the chairmanship of the CCP, a post abolished in 1982.

As secretary-general, Hu closely adhered to Deng's policy of "seeking truth from facts" and promoting "socialism with Chinese characteristics," both meaning more pragmatism and less dogmatism. Hu's first task was to rehabilitate the party members who had been persecuted during the Cultural Revolution to restore national confidence and consolidate the position of the Second Generation (the name given to refer to the core leadership of Deng and Chen Yun, assisted by Hu and Zhao Ziyang, from 1978 to 1989).

**Economic Reform**

Hu's next important task was overseeing economic reform and opening up China to facilitate rapid economic development. Like Deng, Hu believed that economic reform should be gradual and begin in the rural areas. This belief came partly from his peasant background and partly from his early service in rural areas. Not least were the lessons he had learned from Mao's radical Great Leap Forward movement, which had done great damage to the national economy. Hu took part in devising measures to develop agriculture, establish special economic zones to attract foreign investment, and introduce capitalist and consumption elements into China's economy, all of which were perceived as being preconditions for China's modernization.

Hu's other important contribution was the establishment of a three-ladder system within the CCP Central Committee Politburo in 1985. This system resolved the succession problem that Mao had created. Because Mao died without naming a successor, his death had created a power vacuum that invited a power struggle, ensuring political instability and a crisis of confidence. Moreover, the three-ladder system helped rejuvenate the party because recruitment of young members could lower the average age of politburo members from the late fifties and early sixties to the mid-forties. One of the young members recruited into the third ladder was Li Peng, who was later responsible for handling the protest that resulted from Hu's death in 1989.

Hu's other efforts included unprecedented attention to ethnic minorities, which did much to enhance national cohesion. In 1980 Hu visited Tibet and promised reform to relieve Tibetan poverty, lessening the three-decade-long Tibet-state tensions. Similar reforms were carried out for other minorities along Chinese borders.

Hu's moderate and progressive stance, especially in economic areas, together with his popularity among youths, irritated some senior party members and conservatives, all of whom felt that Hu's apparently right-wing tendency had undermined Communist ideology. On 16 January 1987, Hu was forced to resign his secretary-general post while keeping his membership in the politburo and the standing committee of the politburo. Hu was deemed to be incapable of controlling the democracy-seeking student demonstrations that broke out in Hefei, Anhui Province, in April 1986 and were supported by similar demonstrations in fourteen other cities. The conservatives held Hu accountable, reasoning that his initial inaction was responsible for the spread of the student antigovernment actions. Thereafter, Hu stepped down from the front line.

**Tiananmen Incident**

After Hu died in Beijing of a heart attack, the next day students gathered in Tiananmen Square to mourn the loss. Their mourning soon became a protest, renewing demands for political liberalization and immediate democracy. To curb the discontent, a state funeral for Hu was held on April 22. However, the funeral failed to end the protest. As students continued to come to the square, similar protests were held in other places, culminating in the Tiananmen Incident that stunned the world. On 4 June, at the order of President Yang Shangkun, who had Deng and Premier Li Peng on his side, the People's Liberation Army marched in to clear and restore order in Tiananmen Square. The violence and resulting deaths focused the world's attention on Beijing.

After the incident the reform measures that Hu had
taken an active role in were slowed, some even halted, and Hu’s name was never mentioned publicly by the government and the media. This silence was broken on 18 November 2005, when the CCP held an official commemoration to celebrate the ninetieth anniversary of Hu's birth. This commemoration generated speculation that the Fourth Generation, led by President Hu Jintao and Premier Wen Jiabao, had plans to rehabilitate Hu.

Huai River
Huái Hé 淮河

The Huai River is one of China’s largest rivers. It has served as a vital source of irrigation, an important route for river transportation, and at times a political boundary between northern and southern regimes. Prone to flooding, it has posed perennial problems for river management, including major drainage projects in the twentieth century.

The Huai is a river in central China, 1,100 kilometers in length and draining a basin of 190,000 square kilometers. It originates at Mount Tongbo in southern Henan Province and flows eastward through northern Anhui Province into Lake Hongze; from there it divides into two channels, one flowing directly into the Yellow Sea, and another flowing south into the Yangzi (Chang) River. The Huai, along with the Yangzi, Huang (Yellow), and Ji rivers, is one of the four principal rivers of China (si ā diú).

Historically the lower course of the Huai River has changed significantly in response to the shifting course of other rivers and drainage projects. Originally it flowed directly into the sea; in the twelfth century the Huang River shifted its course southward and entered the sea through the Huai River channel, making the Huai River its tributary. The high silt content of the Huang River raised its bed above the level of the Huai, and the resulting drainage problems led to the expansion of Lake Hongze at their confluence. From this point onward the Huai River became a constant source of floods, and its control became one of the most important and frequently discussed issues in Chinese river management. After the Huang River shifted its course northward once more in the early 1850s the lower course of the Huai was subject to almost a century of intensive engineering and flood control. Since 1950 the government of the People’s Republic of China has tried to solve the flooding problem by a complex system of reservoirs, dams, and drainage channels.

The Huai River, aside from its importance for agricultural irrigation, has always played a crucial role in Chinese history as a transportation route. Beginning with the state of Wu in 486 BCE, successive governments have used the Huai as a major artery in larger efforts to connect rivers and forge broad river transportation networks, and water from the Huai was critical for the functioning of the Grand Canal linking Beijing with Hangzhou in the Yuan (1279–1368), Ming (1368–1644), and Qing (1644–1912) dynasties. Together with the Qinling Range, the Huai has formed the geographic, economic, and cultural boundary between dryer, grain-growing northern China and wetter, rice-growing southern China. In periods of political disunity, such as the North and South Dynasties (220–589 CE), Five Dynasties period (907–960 CE), and the division between the Southern Song dynasty (1127–1279) and Jurchen Jin dynasty (1115–1234), the Huai also formed a political boundary between the two regions. During the Yuan dynasty Han Chinese living south of the Huai and formerly subject to the Southern Song were termed Nanren and formed a class of subjects distinct from northern Chinese Hanren.

Matthew MOSCA
Huai River Management

Responsibility for the management of the Huai River has passed through many hands and organizations. In the early twentieth century the Nationalist Government attempted to reestablish control over Huai River management by forming the Huai River Conservancy Commission.

By the nineteenth century the Qing government, facing internal and external challenges, was unable to muster the resources to address deteriorating conditions in the Huai valley. In mid-century, the Qing government abruptly withdrew administrative responsibility over the Huai River management as it turned its interest to developing the littoral. The consequence was the complete collapse of Huai River control. Endemic cycles of flood and famine resulted in extreme social and economic dislocation in the Huai valley by the early twentieth century.

Following the collapse of the Qing dynasty in 1911 and the “warlord” period of the teens and twenties, the Nationalist Government attempted to reestablish central control over the Huai River management as part of its national reconstruction program. One of the first institutions created by the Nationalist Government was the Huai River Conservancy Commission. Faced with severe hydraulic problems, the goals of the Huai River Conservancy Commission were two-fold: to stem flooding and to advance industrial development. The first goal was largely political—to preempt potential political opposition arising from economic dislocation in the valley. The second goal was to promote modern hydraulic practices such as hydroelectric generation and modern transport to serve the industrial goal of the Nationalist Government.

The Huang (Yellow) River, known as “China’s sorrow” for its disastrous flooding throughout history, is China’s second longest, after the Yangzi (Chang) River. Named for the yellow silt in its waters, the lower reaches of the river are considered the cradle of Chinese civilization, with archaeological sites dating back 7,000 years. The Huang is an important source of hydroelectric power and water for irrigation.
The Huang (Yellow) River originates in the Qinling Autonomous Region (AR); then through Inner Mongolia AR before turning south, forming the border of Shaanxi and Shanxi provinces. From there, the Huang turns east through Henan and Shandong provinces before emptying into the Bohai Gulf.

The lower basin of the Huang River is considered the birthplace of Chinese civilization because archaeologists have discovered sites there dating as far back as 5000 BCE; the emergence of the Yangshao culture (5000–3000 BCE) and the Longshan culture (3000–2200 BCE) on the North China Plain along the Huang River has also been chronicled.

On numerous occasions throughout China’s long history, the Huang River has overflowed its banks, causing extensive damage to nearby farmland and surrounding communities. Dikes have been constructed to prevent the flooding but are rebuilt continually. The river has also changed course many times, causing untold destruction. Because the river runs through very flat land, the water follows the natural law of least resistance and changes course frequently. During the Yuan dynasty (1279–1368), the Huang changed its course from northern to southern Shandong Province, flooding 7,769 square kilometers (3,000 square miles) of farmland. Between 1853 and 1855, the river again began flowing through northern Shandong Province, destroying large areas of farmland. And in 1938 General Chiang Kai-shek (1887–1975) ordered his troops to destroy the dikes along the river in Henan Province to flood a valley to stop the advance of Japanese troops. Although the advance was stopped and many of the enemy killed more than 1 million Chinese civilians drowned.

In 1955 the government began a fifty-year construction
program designed to control flooding and to harness the river for hydroelectric power and irrigation. One of the most important components of the plan is the San-Men Gorge Dam in western Henan Province. Begun in 1955 and completed in 1974, the dam helps to control flooding and to store water for a hydroelectric station. Another important dam is the Liu-Chia Gorge Dam, along the middle basin of the river. At this site the river is harnessed to produce hydroelectric power. The Liu-Chia hydroelectric power station was the largest and most productive in China until the Three Gorges Dam (on the Yangzi River) becomes operational in 2009. Although the Huang still overflows its bank almost every spring, flooding is under control and there have been no major floods on the river since the mid-1970s.

Located in southern Anhui Province, Huang Shan is one of the most spectacular mountain ranges in China. For thousands of years, Huang Shan has inspired literati, artists, pilgrims, and travelers. With seventy-seven peaks over one thousand meters, Huang Shan features qisong (“astonishing pines”), guaishi (“peculiar rocks”), yunhai (“sea of clouds”), and wenquan (“hot springs”).

Huang Shan (literally meaning “Yellow Mountain”) is one of the most spectacular mountain ranges in China, offering landscape views as stunning as those depicted in traditional Chinese paintings. Located in southern Anhui Province in east central China, Huang Shan contains seventy-seven peaks over one thousand meters, twenty-four streams, two lakes, and three waterfalls. The range covers a core area of 154 square kilometers with a buffer zone of 142 square kilometers.

Though not listed among the famous Wuyue, or “Five Great Mountains” (Mount Tai in the east of the country, Mount Heng in the north, Mount Hua in the west, Mount Song in the center, and Mount Heng in the south), the stature of Huang Shan’s beauty is not to be denied. The renowned geographer and traveler Xu Xiake (1587–1641) once praised the magnificence of Huang Shan: “Not a mountain in the world is like Huang Shan of Anhui. There would be no mountains to climb after ascending Huang Shan.”

Huang (Yellow) Shan is one of the most spectacular mountain ranges in China, offering true landscape views just as stunning as those depicted in traditional Chinese paintings. Photo by Joan Lebold Cohen.
Shan. Sightseeing stops here.” A popular saying has thus followed: Wuyue guilai bu kan shan, Huang Shan guilai bu kan yue (“Upon returning from Wuyue, one does not want to visit any mountains; upon returning from Huang Shan, one does not even wish to see Wuyue”).

Huang Shan features qisong (“astonishing pines”), guaishi (“peculiar rocks”), yunhai (“sea of clouds”), and wenquan (“hot springs”). Pine trees are scattered amid steep slopes and precipitous cliffs, many of which are millennia old. Yingkesong (“Guest-Greeting Pine”), stretching its branches predominantly on one side of its trunk, is unique of all pine trees found in Huang Shan. The tree, an 800-year-old specimen of the species Pinus Hwangahenensis growing out of granite, is China’s most famous tree. The 10-meter high tree has been guarded around the clock against manmade and natural disasters by a series of bodyguards since 1983.

The mountains are rife with peculiar granite rocks of many shapes, some named after plants or animals, some after legends. Lianhua Feng (“Lotus Flower Peak”) is the highest among the three major peaks; the others are Tiandu Feng (“Celestial Capital Peak”) and Guangming Ding (“Bright Summit Peak”). More than 1,800 meters high, these peaks are often above the clouds.

The mountains are known for their unusual natural features. The phenomenon known as “sea of clouds,” where waves of clouds and fog surge among the hills and peaks, may appear during all four seasons in Huang Shan. At sunrise or sunset the splendid sea sometimes refracts sunlight, forming a colorful aureole known as baoguang.

The western slope of Huang Shan, much steeper than the eastern side of the mountain.

PHOTO BY PAUL AND BERNICE NOLL.
Humans have also left their mark. Over two hundred engravings have been preserved in the rock faces, together with ancient paths, bridges, and pavilions of historical cultural value. Under the administration of Huang Shan City, the villages of Xidi and Hongcun are renowned for their Anhui/Huizhou architecture dating from the Ming (1368–1644) and Qing (1644–1912) dynasties, featuring white walls, green roofs, horse-shaped gables, ornamental bricks, and both wood and stone carvings.

Due to its natural beauty, cultural heritage, and significance as a treasure house of rare and endangered species, Huang Shan was listed as a World Historical Heritage Site by the United Nations Educational, Scientific, and Cultural Organization (UNESCO) in 1990.

Huang Zongxi was an important philosopher and author who worked to uphold Confucian principles of government after the fall of the Ming dynasty in 1644. Huang roundly criticized tyrannical monarchies in favor of democratic principles long before Rousseau and Locke in the West.

Huang Zongxi was an important Confucian philosopher, political theorist, author, and historian living between the Ming and Qing dynasties. A versatile talent, Huang is widely acclaimed not only as the first serious scholar of Chinese intellectual history, but also as the first Chinese enlightened thinker.

Like his father who, being a member of the famous Donglin Academy (Eastern Grove Academy 東林書院), closely watched and boldly criticized the Ming court politics, Huang Zongxi joined a similar association of men of letters called Fushe (The Restoration Society 復社) and developed a keen interest in politics as Ming political crises deepened. After the Ming collapsed in 1644 under a nationwide rebellion and the Manchu invasion, Huang spent the next few years participating in a military movement aimed at restoring the Ming dynasty. When such efforts proved to be futile, Huang turned away from the actual politics and devoted the rest of his life to scholarly research and writing.

Huang's writings covered many different areas from literary creation to studies of Confucian classics, history, geography, mathematics, astronomy, calendar, and music. His most influential works are Mingyi daifang lu 明夷待詰錄 (A Plan for the Prince, 1663) and Mingru xuean 明儒學案 (Records of Ming Scholars, 1676). Mingyi daifang lu comprises twenty short essays on the prince, ministership, law, eunuchs, subofficials runners, methods of selecting talents and officials, schools, the land and tax system, finance, the military, and so forth. Haunted by the Ming’s fall, like many of his Confucian intellectual contemporaries, Huang converted his energy into defending the Way of Governance (zhi 治) as an historical mission. In this effort, while drawing broad lessons from the Ming’s fall, Huang pushed the Mencian-type of criticism of tyrannical princes one step further. At a time when France was under Louis XIV and European royal absolutism was a dominant ideology and practice, Huang sharply attacked the autocratic monarch who treated the whole country (tianxia 天下) as his private property, the ministers as his private servants, and the law his as own family rules. Huang proposed, in today’s words, a “gentry democracy” guided by Confucian moral principles and a doctrine of “government for the people.” Huang’s work was completed twenty-seven years earlier than John Locke’s Two Treatises on Civil Government and a century earlier than Rousseau’s The Social Contract.

Mingru xuean is a remarkable scholarly accomplishment in which Huang systematically introduced and commented on more than two hundred individual
Ming thinkers and scholars of seventeen different groups. This work also recorded Huang’s own philosophical ideas. Huang followed the great Ming Confucianist Wang Yangming (1472–1529) and rejected the dichotomous view of Zhu Xi (1130–1200). Huang argued that li (principles) is the li of qi (material force/actual beings) and xing (innate human nature) is the xing of xin (human mind), so li and xing cannot exist independently but are contained in qi and xin respectively. The significance of Huang’s argument is that there were no other places to search for the innate human goodness except in one’s own mind and heart, which should be the focus of Confucian moral cultivation. The combination of Huang’s place in time, the quality of his historical scholarship, and his sharp criticism of monarchical tyranny with the introduction of democratic conviction make him an important predecessor to Enlightenment thinking in China.

Huangdi Neijing, one of the earliest and most important classics of Chinese medicine, consists primarily of two texts: the Suwen (Plain Questions) and Lingshu (Spiritual Pivot). These texts articulated the basic theoretical construct of Chinese medicine and laid the foundation for the primary diagnostic and therapeutic methods of the tradition.

One of the earliest and most important classical texts of Chinese medicine, *Huangdi Neijing* (Inner Canon of the Yellow Lord) has been attributed to Huangdi (Yellow Lord) and some of his ministers. Huangdi was the first of five legendary pre-dynastic Chinese rulers and cultural heroes who was believed to have ruled the North China Plain in the third millennium BCE. Since the eleventh century the majority of Chinese critical philologists (scholars of literature and of disciplines relevant to literature or to language as used in literature) have begun to treat the *Huangdi Neijing* as the work of a single author composed during the Warring States period (475–221 BCE), but studies of the medical manuscripts excavated in 1973 from Mawangdui tomb No. 3, a Han dynasty (206 BCE–220 CE) tomb situated at the northeastern part of the city of Changsha, Hunan Province, demonstrated that the *Huangdi Neijing* was a collection of interrelated short essays composed at different times from different medical lineages but were brought together sometime in the first century BCE.

*Huangdi Neijing* was listed in the bibliographical treatise *History of the Former Han Dynasty* as a single work of eighteenjuan (fascicles—the divisions of a book published in parts), but it survived in four extant partially overlapping recensions (revisions) of varying lengths: Suwen (Plain Questions), Lingshu (Spiritual Pivot), Taisu (Great Simplicity), and Mingtang (Bright Hall). Since the tenth century Suwen and Lingshu, the most complete and influential of these recensions, have been collectively known as the *Huangdi Neijing* or simply Neijing. Both texts consist of eighty-one chapters and were written in the form of dialogues between the Yellow Lord and his ministers, among whom Qi Bo appears most often. As a whole, these texts provided the basic rubric (rule) for classical Chinese medicine. Contrary to shamanistic or demonic medicine that had dominated earlier medical practices, Neijing takes a strongly naturalistic approach to diseases and healing. It regards the human body as a microcosm that functions on the same principles operating in the macrocosm: qi (Ch’i), yin, yang, and the five phases. Applying these basic cosmological concepts to understanding the human organism, it articulates the basic theoretical construct of Chinese medicine in terms of yin and yang, the zang-fu organ systems, and the circulation of qi within the meridians. Health or illness is seen as dependent on the state of balance between the individual’s yin and yang powers within and between the body and the environment without. Neijing discusses various aspects of human anatomy, physiology, and pathological processes, the effects of nutrition, living habits, emotions, and environmental factors such as winds on a person’s health, the signs and symptoms of illnesses, as well as diagnostic and therapeutic measures. Whereas Suwen treats
Humans, Sky, and Earth

In this excerpt from the Huangdi Neijing, the Yellow Emperor asks Bogao about the relationship between the human body and the earth and sky.

Bogao replied, “The sky is round, the earth rectangular; the heads of human beings are round and their feet are rectangular to correspond. In the sky there are the sun and moon; human beings have two eyes. On earth there are nine provinces; human beings have nine orifices. In the sky there are wind and rain; human beings have their joy and anger. In the sky there are thunder and lightning; human beings have their sounds and speech. In the sky there are the four seasons; human beings have their four extremities. In the sky there are the Five Sounds; human beings have their five yin visceral systems. In the sky there are Six Pitches; human beings have their six yang visceral systems. In the sky there are winter and summer; human beings have their chills and fevers. In the sky there are the ten-day ‘weeks’; human beings have ten fingers on their hands. In the sky there are twelve double-hours; human beings have ten toes on their feet, and the stalk and the hanging ones complete the correspondence. Women lack these two members, so they are able to carry the human form [of the fetus]. In the sky there are yin and yang; human beings are husband and wife.

These topics in general, Lingshu is more focused on how to apply acupuncture to the circulation tracts (meridians).

Huangdi Neijing is not only an influential text of classical Chinese medicine but also a critical source for understanding early Chinese philosophy and cosmology. Its views on the relationship between the interior and exterior of the body—and between the human organism on the one hand and the environment and the cosmos at large on the other both—drew upon and provided the ultimate expression for the correlative thinking that underlay the mainstream of the broader Chinese philosophical discourse during the last three centuries before the common era.

Huanglongsi is a nature reserve on the edge of the Tibetan plateau in northwestern Sichuan Province. It is the home of Yellow Dragon Temple, a Daoist monastery, as well as numerous hot springs and dramatic glaciated peaks. It is also one of the last holdouts of the critically endangered giant panda.

Huanglongsi (Yellow Dragon Temple) is a nature reserve area in northwestern Sichuan Province on the edge of the Tibetan Plateau, 150 kilometers from the bustling provincial capital of Chengdu (estimated 2007 population 11.2 million). Huanglongsi, along with the adjacent ravine to the north, Jiuzhaigou, was recently designated by the United Nations Educational, Scientific, and Cultural Organization (UNESCO) as a World Heritage Site for its natural scenery and endangered wildlife (Huanglongsi in 2000, Jiuzhaigou in 1997). The limestone geology of the area, combined with hot spring algae growth, has produced a great range of colored waters in both areas: turquoise, green, yellow, and milky white.

Much of the area was heavily logged in the 1980s; today the area, which has been banned to logging since 1998, is one of the last holdouts of the giant panda (Ailuropoda melanoleuca). The reserve also features the smaller (and also endangered) red panda (Ailurus fulgens, also called the lesser panda), golden snub-nosed monkeys (Pygathrix roxellanae roxellanae), water deer (Hydropotes inermis), and 55 other species of mammals, as well as 155 species of birds and five species each of reptiles and amphibians. There are also vast areas of rhododendron, wild roses, clematis, and wild ginger.

The Yellow Dragon Temple, for which the reserve is named, is a Daoist monastery. Because it is located so high (3,430 meters) in the Minshan range, the temple was previously known as the “Snow Mountain Temple” (Yueshansi). (Yueshan, the “Snow Mountain” itself, features China’s easternmost glacier.) The temple is situated at a pass into a forested valley surrounded by glaciated peaks (up to 5,000 meters) and dotted with more than three thousand natural hot pools of various-colored water, from which the Tibetan name of the temple, Gser mthso lha khang (Yellow Pool Temple), is derived. The existing structure, dating from the Ming dynasty (1368–1644), originally was the rear of a complex of three halls.

As a leading telecommunication company in China, Huawei has been growing step by step and maintains its stable position in a globally competitive field and environment. The company credits its ability to thrive and compete to a corporate culture that coincides with the nation’s, which includes many traditional Chinese values, such as helpfulness, diligence, and pragmatism.

Huawei Technology Co., Ltd., (Huawei) was founded in 1988 by Ren Zhengfei in Guangdong Province in the south of China. The company is a supplier for telecommunication network solutions and products, which covers mobile networks (such as GPRS/GSM and CDMA2000), core networks (such as Mobile Softswitch), alternate networks (such as LAN Switch), and other telecommunication business. At the beginning of 2007, Huawei was a business partner of more than thirty-one of the global top 50 international telecommunication companies, including Telefonica, FT/Orange France, China Mobile, British Telecom, China Telecom, and China Unicom. In addition, Huawei’s products and solutions are widely used in the United Kingdom, France, Germany, Spain, Holland, Japan, and the United States.

Departing from the business plan of some other Chinese enterprises, Huawei emphasizes Research and Development (R&D). Every year no less than 10 percent of Huawei’s annual sales income is put back into R&D, with a team of two thousand people (48 percent of Huawei’s total staff) charged with maintaining its cutting-edge technology. Huawei operates R&D centers in Stockholm, the Silicon Valley, Dallas, Moscow, and sites in China, such as Shenzhen, Shanghai, and Beijing. Through this focus Huawei has succeeded in applying for more than 12,500 patents, as of the beginning of 2006. It is considered one of the most intellectually active companies in China.

In telecommunications, standardization means competitiveness to some extent. Huawei sensed and acted on this point long ago. Huawei joined some seventy international standardization organizations and became a leader in some, including the International Telecommunication Union, the 3rd Generation Partnership Project (3GPP), the Institute of Electrical and Electronics Engineers, and the Object Management Architecture. Huawei’s input and effort in positively following industry standardization have helped make the company one of the world leaders in the area of telecommunication (Huawei takes 7 percent of 3GPP basic patents, ranking No. 5 in the world).

Huawei is truly a global player. The international market is the main source for Huawei’s sales. About 70 percent of Huawei’s sales volume came from foreign markets in 2007. The company’s solutions and products have been applied in more than a hundred countries, serving more than 1 billion users. Huawei has eight regional headquarters, more than a hundred branches,
and twenty-eight local training centers around the world.

Huawei’s corporate culture is considered a good model among Chinese companies. As part of its business strategy, the company applies the Huawei Basic Law, which specifies nearly every possible aspect of the company, including corporate values, goals, and social obligations. In the opinion of Huawei’s management and employees, the company’s culture coincides with the national culture, which includes many traditional Chinese values, such as helpfulness, diligence, and pragmatism. Teamwork, which is regarded as the soul of the company, is also heavily emphasized at Huawei. At Huawei success is the team’s success; failure is the team’s failure.

The private sector is growing steadily in China, and large enterprises play an important role. The top corporations not only contribute to the national economy but also serve as examples and leaders in many areas, such as social behavior and responsibility. Huawei is considered one of these top corporations. As an international brand, Huawei continues to grow, which not only benefits Huawei itself but also China in general and, increasingly, the global economy.

Huayan Buddhism

The Huayan school of Chinese Buddhism is part of the Mahayana tradition that examines the metaphysical condition of things. As such, it seeks to explain phenomena as an interpenetration of the universal with the particular, wherein the macrocosm is found contained within the microcosm.

The larger purpose of Fazang’s treatise is to systematize the diverse range of Buddhist teachings and doctrines that existed in China at the beginning of the Tang period (618–907). This act of classification and standardization was far more complete than the one presented by the Tiantai school in that Fazang addressed the various modes of Buddhist thought that had come into China after the death of Zhiyi. Tiantai is the first true Chinese school of Buddhism, which developed with little influence from India, and which emphasized both meditation and engagement with the world. Zhiyi (538–597) is considered to be the founder of the Tiantai school. These various modes Fazang arranged into five classifications, or the Five Teachings: the Hinayana, which sought to explain phenomenal reality; the Mahayana, which examined the nature of phenomena as well as the Middle Way (which, in turn, describes the universal principle that all reality shares—namely, emptiness); late Mahayana, which elucidated the relationship of the particular to the universal; the Abrupt Teaching with its explication of silence; and lastly the Huayan, or what Fazang called the “Perfect Teaching,” which defined emptiness as the interpenetration of all existence.

Interpenetration

The primary teaching of Huayan is its paradigm of interpenetration; that is, the absolute (or the principle) and the thing (or being) are completely united, so things cannot exist apart from the absolute. The absolute and the particular inform one another, in that each is contained within the other. This means that when a thing is placed within its context and associates with other things, it and they have similarities as well as differences. As a result, each thing perpetually interacts with all other things in a contradictory and harmonious relationship so that when the thing is affirmed, that which is not the thing is negated, and if the thing is negated, that which is not the thing is affirmed. The relationship is an eternal giving and taking;
the filling of a gap, which at the same time creates a gap; the principle and being forever filling each other and emptying into each other. In this way Fazang defines form and emptiness: form is emptiness and emptiness form; the interrelationship of the two is an opposition and at the same time a cooperation, a fulfillment, which leads to endless variations that may be called creation.

Reality, then, is a unity, but also a multiplicity of interacting unities. And reality is complete but also lacking; it needs nothing but also needs everything. Such contradictory reasoning explains the cycle of formulation and dissolution of things: form and content are always unstable and shifting. Such negative assertions, or paradoxical language, calls into question the being of phenomena so that the truth of a thing is recognized—that it may take on a form, yet it is empty of a self; and if there is no self, then there cannot be an origination or an existence. The idea of permanence, therefore, is false, since permanence demands that one thing be static and another fluid. For Fazang, stasis is illusion, since there is only perpetual flux; and this acknowledgement means that truth is both ad hoc and ultimate. Such simultaneous harmony and contradiction is the state of all phenomena. Only the enlightened mind can discern this interrelationship of things.

Reasons for Paradoxical Language

The purpose of such paradoxical language is to demonstrate the disparity between the unenlightened mind and the enlightened one. In other words, conventional truth (based as it is in discerning the difference between subject and object) cannot reach ultimate truth, which exists outside this paradigm, since this difference is housed entirely in the interaction of the self with language. Ultimate truth, which Fazang calls “true emptiness,” or “suchness,” may be revealed only to the enlightened mind in sudden bursts of realization; it cannot be known by any conventional, systematic means. The self is entirely bereft of all referents that provide it with sense and meaning; it has become empty. When this state of being, devoid of meaning, comes about (enlightenment), only then is there the possibility that ultimate truth may be known. And Fazang describes ultimate truth as that realization that is empty of all tangible form and is unconditioned in that it is neither subjective nor objective. Ultimate truth is nothing (or emptiness).

Another reason for such paradoxical language is that it seeks to mirror the experience of the self that seeks to
grasp ultimate truth. The self can only know tangible, conditioned forms while ultimate truth is intangible and unconditioned. The self can only know tangible, conditioned forms while ultimate truth is intangible and unconditioned, which brings about a fall into paradox each time the self seeks to comprehend that which it cannot comprehend; for the self to know that which lies outside it, it must rely on objectification—through language, for example. But ultimate truth does not obey the division between the subject and the object, between the inner and the outer. Ultimate truth is both subject and object at once; it is both inner and outer at once. And language cannot express this relationship properly or truthfully.

The only way possible, therefore, is to assert a statement and its immediate denial simultaneously. Ultimate truth is a dilemma that cannot be resolved because even when it becomes revealed to the enlightened mind, the expression of that revelation must be reduced to examples—that is, to objectification or to conceptualization that render the revelation far less than the truth, for they are nothing more than descriptions of the steps toward enlightenment rather than an accurate record of enlightenment. The bond between the thing and the idea is false.

Since ultimate truth is the perpetual interaction of the principle and the phenomena, a relationship in which neither one is lessened nor destroyed, the paradox of the one and the not-one can never be resolved, for reality is always empty. If it were resolvable, then the opportunity for ultimate truth to reveal itself in sudden intuitive bursts would not exist.

The Huayan school was the last flowering of Buddhist thought in China. In the years 841 to 845, there was a massive suppression of the new faith. However, the influence of the Huayan school was far ranging, for it became the founding doctrine of all the subsequent East Asian Buddhist schools, such as Zen Buddhism.

Hubei Province is located in central China; it is approximately the size of Syria. It was the center of the Chu kingdom during the Eastern Zhou dynasty (770–221 BCE); today the steel yards and iron works of the capital, Wuhan, are among the largest in China. The huge Three Gorges Dam (the world’s largest engineering project) is being built in Hubei and is scheduled for completion in 2009.

Hubei (Hu-pei, Hupeh), a central province that covers 187,400 square kilometers (about the size of Syria), borders on Sichuan and Shaanxi provinces in the west, on Henan Province in the north, on Anhui Province in the east, and on Hunan and Jiangxi provinces in the south. Hubei is traversed by the Yangzi (Chang) River from west to east, with the greater area of the province located north of the river. More than three-fourths of the province is hilly and mountainous, with peaks in the west rising more than 3,000 meters above sea level, whereas the east consists mainly of low-lying plains.

The climate is subtropical, with monsoon rain during spring and summer. Summers are hot and humid; winters generally are mild. The annual average precipitation varies between 700 and 1,700 millimeters, which is the highest average in the southeast. Most of Hubei’s population lives in rural areas along the rivers and in the lake district in the east, where the capital, Wuhan (estimated 2007 population 8.29 million), also is located.

The city of Wuhan originally was three cities separated by the Han and Yangzi rivers, but these cities were joined by bridges in the 1950s. During the Eastern Zhou dynasty (770–221 BCE) the Hubei area was the center of the Chu kingdom, and copper mines were operating near present Daye County, not far from Wuhan. With the unification of China in 221 BCE by the short-lived Qin dynasty (221–206 BCE), Hubei became part of the Chinese empire, but not until the Tang dynasty (618–907 CE) did emigration from the north accelerate, and the province became a wealthy rice-producing area. During the nineteenth century the province suffered greatly under the Taiping Rebellion (1851–1864), the largest rebellion in China’s history, during which an estimated 20 million people lost their lives. Cities along the Yangzi River were opened for trade with the Europeans, and tea became a major commodity. In the next century, the rebellion that ended the Qing dynasty (1644–1912) originated in Hubei. During the Japanese occupation of eastern China (1937–1945), parts of Hubei were controlled by Japanese troops, and industrial works were bombed.

Large areas of the province are well suited for agriculture; the major crops are rice, wheat, corn, sweet potatoes, cotton, and rapeseed. Products indigenous to Hubei include tangerines, tremella, lacquer, camphor trees, and medical herbs and tea. The iron works and steel yards of Wuhan are among the largest in China, and its industry
manufactures engines, farm machines, railroad cars, and transport machinery.

In 1994 the Chinese government began work on the Three Gorges Dam, a gigantic dam on the Yangzi just west of Sandouping, located about 35 kilometers west of the river port of Yichang. It is the world’s largest engineering project, and China’s largest since the building of the Great Wall. The project is scheduled to be completed in 2009 and is expected to meet nearly 10 percent of China’s energy needs. An estimated 1.3 million people in western Hubei and the neighboring province of Sichuan, however, have been displaced by the dam, which has inundated 17 cities, 109 towns, and more than 1,500 villages.

The Hui are among the most populous, as well as the most widely distributed, of China’s fifty-five minority groups. Mostly concentrated in the northwest Chinese autonomous regions of Ningxia Hui (which is named for them) and Xinjiang Uygur, and the provinces of Gansu and Shaanxi, the Hui are mainly Sunni Muslims. Often persecuted during China’s Cultural Revolution, there has been a revival of Hui ethnic consciousness since the 1980s.

Hui is a state-recognized nationality of China characterized by its combination of Muslim religion and Chinese culture. Alternative names include Huihui and Dongan. The Hui are among the most populous of China’s minorities. With 9,816,805 people (2000 census), the Hui are the fourth most populous of China’s fifty-six ethnic groups after the Han majority and the Zhuang and Manchu minorities, and the most populous among those ten ethnic groups classified as Muslim. The Hui are also the most widely distributed of China’s minorities. Although the main concentrations are in

the northwest, such as in the Ningxia Hui and Xinjiang Uygur autonomous regions, and in Gansu and Shaanxi provinces, communities also exist in Yunnan and elsewhere, and even in Hong Kong, Taiwan, and overseas Chinese communities. Most are Chinese-speaking, retaining Arabic only to read the Quran.

Islam and Society

Muslims have lived in China since the seventh century, notably in the southeast. But it was not until the Mongol conquest of the thirteenth century that many came, gradually settling and adopting Chinese culture, speaking Chinese, and marrying Chinese women. To this day most Hui maintain a belief in a single god, abstain from pork, practice circumcision, and attend mosques in Hui communities. Intermarriage is becoming more common but remains infrequent. Hui dedication to Islam is much stronger in the northwest than it is elsewhere. In the southeast some people of Muslim descent regard themselves as Hui while following customs and beliefs hardly different from their Han neighbors.

The Hui Muslim tradition is Sunni, but sectarian divisions have been common historically. Relations with the Han Chinese have often been contentious. There has long been a portion of the Hui community that has valued its links with the Islamic peoples west of China more than it has those with their Chinese neighbors. Links with world Islam are still significant, with such Islamic countries as Saudi Arabia funding Islam in China. Although disputes occasionally arise over matters like Hui disgust for pork as opposed to their Han neighbors’ favoring it, these only rarely develop to the point of disrupting society.

Historical Reaction to the Chinese State

The Hui have shown much opposition to the Chinese state for various reasons, including that it is infidel. Despite much violence, there is doubt over whether Hui history is any more conflict ridden than Chinese history as a whole.

The nineteenth century saw a high point in Hui rebellions against Chinese regimes, all fiercely suppressed. Two were particularly devastating. One broke out in western Yunnan in 1855. Its leader, Du Wenxiu, later set up a sultanate based in Dali. Government troops retook Dali at the end of 1872 and executed Du. The other rebellion engulfed Shaanxi and Gansu provinces from 1862 to 1873, with Ma Hualong (executed 1871) among its main leaders. Government accounts depict these Muslim rebels as militant bandits who preached the apocalypse.

Since China became a republic in 1912, the Hui have generally been loyal to the Chinese state and fought for it against foreign enemies and even against non-Hui Muslim rebels. The Hui warlords from the Ma family, notably the brothers Ma Hongbin (1884–1960) and Ma Hongkui (1892–1970), ruled the northwestern provinces of Shaanxi, Gansu, and Ningxia from the 1910s to 1949, mostly supporting Chiang Kai-shek and helping in the war against the Japanese.

Hui in the People’s Republic of China

The government of the People’s Republic of China formally established the Chinese Islamic Association in 1953. The government tolerates and patronizes Islam as long as it does not threaten the state. In October 1958 it set up the Ningxia Hui Autonomous Region as a province-level administrative unit with unusually great concentrations of Hui people. During the Cultural Revolution (1966–1976), Muslims were persecuted and mosques were desecrated. The Hui suffered serious religious and ethnic persecution and many hid their identity. Repression resulted in the most serious incident in the ethnic areas during the Cultural Revolution: the Shadian Incident of 1975. After local Hui in the Yunnan village Shadian were refused permission to reopen a mosque, they formed a militia group. Government troops moved in and razed the village. A week’s fierce fighting left more than 1,600 Hui dead. In 1979 the government apologized and had seven new mosques built in Shadian and surrounding areas.

Since the early 1980s, Hui ethnic consciousness has revived strongly. The Hui have remained loyal to China, showing little support for and much opposition to Muslim secession from China.
The Hui are traditionally noted for their commercial skills. The Asian studies scholar Dru C. Gladney (1998, 116) wrote: “Hui are known in every small town in China for certain ethnic specializations: butchering beef and lamb, tanning leather, cobbling shoes, running small restaurants, processing wool, and carving stones and jewelry.” An interesting recent change is the rise of consumerism among urban Hui. This has come along with modernization, which urban Hui greatly favor, believing it in line with the Quran.

Culture

A tradition of Hui Chinese-language Islamic scholarship developed in China, including in mysticism (Sufism). In addition, the Hui have contributed to such Chinese arts such as the Beijing Opera. The Hui do well socially and educationally, with literacy rates among the highest of the minorities. Many urban Hui, including women, enter the professions. As the scholar Brent Haas wrote when discussing Jonathan Lipman’s 1997 study of Muslims in China, Hui history is one “of becoming and then being Chinese while remaining Muslim” (Haas 2006). Currently few physical or nonreligious cultural characteristics distinguish the Hui from the Han.

Huineng

Huinéng 慧能

638–713 CE  Chan Buddhist patriarch

Huineng was the Sixth Patriarch of the Chinese Chan Buddhist school. His teaching of “sudden enlightenment” (duňwu 頓悟) became the essential aspect of the Southern Chan (nan-čan 南禪) tradition. Subsequent Chan sects all traced their lineage back to Huineng, and they came to be known as the “Five Houses and Seven Schools” (wújia qízōng 五家七宗).

Huineng (638–713 CE) was the sixth patriarch of Chan Buddhism. The Platform Sutra of the Sixth Patriarch (Liuzu tanjing), an important Chan text written between the eighth and ninth centuries, is said to have contained the patriarch’s autobiographical account and sermons he preached at Dafan Temple in Shaozhou, Guangdong Province, shortly before his death. Huineng’s emphasis on “sudden enlightenment” (duňwu) and advocacy of the “no-thought” (wúnian) practice became the hallmark of the Southern School (nan-zong) of Chan Buddhism, as opposed to the Northern School (beizong) led by Shenxiu (606–706), who allegedly taught “gradual enlightenment” (jiănwu).

According to the Platform Sutra discovered at Dunhuang in Gansu Province, Huineng was born into the Lu family in south China. His father died when Huineng was still a child. Poor and illiterate, Huineng sold firewood to support his mother and himself. One day he happened to hear someone reciting the Diamond Sutra (one of the discourses of the Buddha that constitutes the basic text of Buddhist scripture), and he was awakened. Huineng then decided to seek further instruction of Buddhism; he traveled all the way to the East Mountain in Hubei and became a disciple of the fifth Chan patriarch, Hongren (601–674).

Huineng trenched the pestle in the monastery’s threshing room for eight months. One day Hongren announced that anyone who could write a verse to demonstrate his superior understanding of Chan would be given the patriarch robe and the dharma (the basic principles of cosmic or individual existence). Shenxiu, Hongren’s most learned disciple, wrote the following verse as a demonstration of his qualification:

The body is the Bodhi tree,
The mind is like a clear mirror.
At all times we must strive to polish it,
And must not let the dust collect. (Platform Sutra, sec. 6; Yampolsky, 1967, 130)

In response, Huineng wrote the following verse on the wall:

Bodhi originally has no tree,
The clear mirror also has no stand.
Buddha nature is always clear and pure;
Where is there room for dust? (Platform Sutra, sec. 8; Yampolsky, 1967, 132)

It is said that upon reading the preceding verse, Hongren immediately made Huineng his legitimate successor.

In his sermons recorded in the Platform Sutra, Huineng reiterated the essential teachings of Chan: the doctrine of inherent Buddha nature, the ineffable experience of self-
realization, and the nonconceptual state of enlightenment. However, he placed an unprecedented emphasis on the nonduality of meditation (Sanskrit: samâdhi; Chinese: ding) and wisdom (Sanskrit: prajñâ; Chinese: hui):

Never should one say that meditation and wisdom are different; they are essentially a unity not two. Meditation is the “essence” (ti) of wisdom, and wisdom is the “function” (yong) of meditation. (Platform Sutra, sec. 13; Yampolsky, 1967, 135)

In short, meditation should be considered a simultaneous expression of enlightenment, not a preliminary to enlightenment. From his assertion of the nonduality of meditation and wisdom, Huineng went on to propose a new concept of meditation: the doctrine of no-thought. “No-thought is not to think even when involved in thought … If in all things successive thoughts do not cling, then you are unbound” (Platform Sutra, sec. 17; Yampolsky, 1967, 138). Through the Platform Sutra enlightenment in Chan thus came to mean a direct insight into one’s self-nature, a sudden realization of one’s inherent Buddha-hood, and a spontaneous manifestation of one’s unbiased and detached mind in everyday life.

According to Chan history, Shenxiu’s Northern School declined after the eighth century, whereas Huineng’s Southern School continued to expand. Subsequent Chan sects all traced their lineage of “mind-to-mind transmission” (yixin chuanxin) back to Huineng, and they came to be known as the “Five Houses and Seven Schools” (wujia qizong). Among them Linji and Caodong were the most prominent ones, and both continue to flourish in Japan and Korea today.

Further Reading

Scholars, politicians, and activists—inside and outside of China—have long debated the theories behind and the application of human rights in the world’s most populous country, and Western media thrives on stories denouncing China’s human rights record. This debate probably causes more misunderstanding between China and the West than any other. The history of human rights in China divides into three parts: the rallying cries of human rights activists, the political and academic arguments of the government and foreign scholars, and Beijing’s suppression of human rights. The activists do not concern themselves with the intellectual or historical origins of human rights or with their Western relationship to China. They are engaged in the application, not in the historical legitimacy of the rights. The cultural theorists argue whether China is exceptional and thus not part of the universal code of human rights, or whether China has a historical background that fostered human rights ideas. Beijing’s actions have created a vast response of critics both inside and outside China.

The acceptance of human rights for China was not universal. Radicals and reformers like Liang Qichao (1873–1927) adopted a Darwinian and Spenserian view that denied the existence of human rights because all rights were considered to be created by the powerful. From this point of view, only the strongest survived. It was necessary for the state to become strong in order to protect the people, even if the people’s rights were denied. What is significant in the criticism of human rights doctrine is that the argument is not based on Chinese values but on Western criticism of human rights theory. The debate within China about human rights was a pragmatic one: would they strengthen or weaken China, not whether they were foreign or domestic.

The founding of the Republic of China in 1911, the collapse of the Qing dynasty, and the subsequent abdication of its emperor in 1912 ushered in a period of domestic and international chaos: warlords, Japanese intervention, the rise of nationalist reformers, and Communist revolutionaries. Sun Yat-sen, the founder of the Nationalist Party...
(Guomindang), disparaged the concept of human rights. All rights and power came from the political party or the state. People’s rights were valid as long as they supported the state. Citizens who opposed the state lost their rights. These ideas were shared by the leaders of both the Nationalist government under Chiang Kai-shek, and the current Communist leadership.

Conversely, many early Nationalists and Communists supported the rights of the individual. Gao Yihan (1885–1968), a Guomindang leader, advocated for political and civil rights: freedom of speech, freedom of conscience, freedom of assembly, and rule by law. Chen Duxiu (1879–1942), one of the founders of the Chinese Communist Party (CCP), initially argued for civil and political rights in the tradition of the American and French revolutions. Li Dazhao (1888–1927), another founder of the CCP, stressed the socialist rights of economic and labor rights over the civil and political rights of the individual. But he did not renounce the traditional nineteenth-century definition of individual rights. His stress on people’s rights (min ben) was related more to the ideas of socialism than to the Confucian stress on the people’s livelihood.

From 1915 to 1923 (a period generally named the May Fourth Movement for demonstrations in Tiananmen Square held on 4 May 1919), many journals debated the nature and the pros and cons of human rights. The most vigorous debates were published in New Youth, New Tide, and Human Rights. Freedom of thought and of publication dominated the concerns of these editors. Human rights were necessary not only to protect the individual from the state but, even more important, also to provide for the dignity of the individual. Without rights people would lose their human dignity and collapse into a state of slavery. It was the duty of both the citizen and the state to provide for the common good of all people.

The trend toward social utility was reinforced by the visits of John Dewey (1859–1952) and Bertrand Russell (1872–1970) to China and the writings of English idealists such as T. H. Green (1836–1882) and David George Ritchie (1853–1903), social liberals such as L. T. Hobhouse (1864–1929), and socialists such as Harold Laski (1893–1970). The popularization of terms such as freedom, democracy, and human rights made them part of the rhetorical framework of the 1920s. They were not always defined in academic terms because they were familiar and considered norms that were applicable to China’s crisis.

The May Fourth Movement was not monolithic in its analysis of why human rights did not exist in China. The New Tide group felt that the tradition of Confucianism had caused the Chinese to repress their feelings and their sense of dignity. The New Youth writers Chen Duxiu, Li Dazhao, and Gao Yihan blamed the government and the warlords for violating what they claimed were their rights of freedom of thought, assembly, and representation in government.

During the Nanjing Decade (1927–1937) and the War of Resistance against Japan (1937–1945, known outside China as the Second Sino-Japanese War) many of these debates became moot. The commitment to national salvation against the Japanese and the civil war between the Nationalists and Communists created a military campaign mentality. The debate transformed to questions of dictatorship versus democracy. Nonetheless, liberals and scholars such as Hu Shi (1891–1962), Luo Longji (d. 1965), Zhang Junmai (1886–1969), and Zhang Pengqun (1892–1957), also known as P. C. Chang, and organizations such as the Xinyue Group, the China League for Civil Rights, and the China Democratic League vigorously argued for the adoption of human rights, though from very different, and often contradictory, perspectives. Hu Shi argued for both civil and economic rights. For him human rights were universal and were to be established in the legal and constitutional system of the Republic of China, a stance that caused a backlash in the Guomindang, which attacked him for his views and passed laws that were even more authoritarian.

Luo’s views were directly related to Harold Laski’s argument that human rights were historical and contextual. Rights and laws reflected the needs of the social and economic system. They should be used functionally to create a safer and more wholesome society. At times the individual’s freedom may need to be curtailed. Zhang Junmai attempted to synthesize the humanism of neo-Confucianism with the philosophical perspective of human rights. He believed that China’s traditional ethics, which were based on conscious and promoted human dignity, were not only the best approach to legitimizing human rights and democracy but also, in fact, China may have been the real source for the West’s views of human rights.

P. C. Chang was China’s chief representative to the Commission on Human Rights, which created the Universal Declaration of Human Rights. He is given credit for
Article 1, which refused to claim that rights were based on natural law or divine inspiration. Faintly echoing Zhang Zhunmai, Chang stressed the innateness of dignity and conscience.

**Human Rights with Chinese Characteristics**

The establishment of the People’s Republic of China in 1949 resulted in a total rejection of the legitimacy of human rights arguments. Human rights were a product of the bourgeoisie and were thus used to maintain the rule of the capitalist and imperialist class. With a few, but startling, exceptions in 1957 and 1978, any mention of human rights was taboo and resulted in imprisonment.

But just before and after the suppression of pro-democracy students in Tiananmen Square (4 June 1989), the Communist authorities began to engage in the human rights debate to justify their authority and their rule. In 1991 a government “white paper” on human rights declared: “Since the very day of its founding, the Communist Party of China has been holding high the banner of democracy and human rights.” This stunning declaration was followed up with academic conferences on human rights and the creation of several institutes especially devoted to human rights, such as the China Society for Study on Human Rights. From 1995 to 1998, the Confucius Foundation in Beijing sponsored a series of international forums with the purpose of discussing Confucius and human rights. In the late 1990s, Beijing signed the two covenants on economic, social, and cultural rights.

The study of human rights in China is initiated and managed by the CCP and the government. It has not included meetings with Chinese citizens or with local non-governmental organizations active in human rights. The official position is that China has developed a socialist system of human rights with Chinese characteristics. Stages of economic and industrial development determine the scope and quality of human rights. Liu Huaqiu, head of the Chinese delegation at the Vienna World Conference on Human rights in 1993, defined the Chinese view succinctly:

> The concept of human rights is a product of historical development. It is closely associated with specific social, political, and economic conditions and the specific history, culture and values of a particular country. Different historical development stages have different human rights requirements. Countries at different development stages or with different historical traditions and cultural backgrounds also have different understanding and practice of human rights. (cited in Svensson 2002)

From this point of view, the most basic rights are those of subsistence and shelter. These economic rights are considered superior to, and of greater priority than, political and civil rights.

There is more to the definition than a mere enunciation of domestic policy. China argues that America and the West use the invasive argument that human rights are universal to force China to peacefully evolve into a colony of Western economic and political control. Beijing does not argue that Chinese cultural (e.g., Confucianism) values prevent it from accepting Westernization. Rather, it is China’s anti-imperialist stand and its desire to create its own national identity in the twenty-first century that makes it refuse to accept standards that serve the interests of Washington, D.C.

**Beijing’s Repression of Human Rights**

The Chinese government has maintained that its sovereignty excludes foreign powers from interfering in its affairs. It has adamantly refused to allow independent agencies to investigate openly and report on its alleged human rights abuses. According to its critics, China has engaged in massive abuse of human rights. With regard to political and civil rights, it has tortured and executed prisoners of conscience, repressed religious organizations, prohibited democratic organizations and meetings, arrested and detained people without trial, and engaged in widespread abuse and repression of women, the unemployed, minorities, and the poor. The Chinese leadership has been accused of long-term genocidal practices against the Tibetan people. Contrary to the Beijing’s claim that it
favors economic and social rights, it has been accused of destroying the environment, censoring the educational system, exploiting workers, and engaging in organized official corruption.

The Tiananmen Square riots resulted in a massive amount of attention to human rights conditions in China. The call for human rights became widespread, though underground, in China, and was openly publicized by Chinese groups abroad. Wang Dan, Wuer Kaixi, and other leaders of the student movement found exile in America and Europe, where they organized resistance groups and published journals such as *China Spring*. American human rights organizations joined forces: Amnesty International and Asia Watch were joined by the online sources Tibet On Line Resource Gathering and Asia Observer. The U.S. government’s pressure on China to adhere to human rights standards was most visible in the arguments surrounding the congressional review of China’s most-favored-nation status and the arguments over entry to the World Trade Organization. The most sensational and informative moment for the Chinese citizenry came on 30 June 1998 when President Bill Clinton spoke on the “Shanghai Radio 990” call-in show. Broadcasting to China’s largest city, the president declared, “whatever differences of opinion we have about what human rights policy ought to be . . . we still have a lot in common. . . . I believe that the forces of history will bring about more convergence in our societies going forward.”

Beijing’s response to these overtures was generally negative. A diatribe entitled *The China That Can Say No* best expressed the voluminous official reactions to the human rights movement. It countered the arguments by exposing America’s human rights abuses and the hypocrisy of the leadership. In the United Nations Commission Xi’an students protesting. The rallying cries of activists echoed throughout China’s turbulent twentieth century.
What are Asian Values?

In the early 1990s, “Asian values” became a hot topic in the international human rights debate. Several countries, with Singapore among the most prominent, accused the West of imposing its human rights standards on Asia without regard for Asia’s specific culture and history. The proponents of Asian values argued that their countries had a different understanding of human rights due to their specific culture and history. While they did not completely reject universal human rights, their cultural relativism nevertheless represented a major challenge to an international consensus on human rights. References to culture and to national conditions (guoqing) have become more prominent in Chinese human rights discourse since the 1990s, but the Chinese government itself has placed much less emphasis on cultural arguments than have nations like Singapore. As a socialist country, China is more wont to argue that different economic systems and levels of economic development influence the understanding and realization of human rights. China’s official position is to identify itself with the Third World as a whole, rather than with Asia alone. Despite the relatively small importance of cultural arguments in official discourse, several Chinese intellectuals and dissidents have written explicit critiques of Asian values. Liu Junning (b. 1961) is one of those who strongly refutes the view that Asian people would have different views from Westerners on human rights and democracy. He believes that the Asian values advocated by Asian political leaders only serve to defend their hold on power and suppress people’s genuine demands for human rights and democracy. Writing in 1998, Liu blamed the leaders particular concept of Asian values for both the recent Asian economic crisis and the attacks on ethnic Chinese in Indonesia in May of that year.

on Human Rights, Beijing’s diplomats claimed their right of sovereignty and denounced what they depicted as fallaciousness of the attacks on their integrity. Human rights activities in China were considered to be antigovernment in nature and result in harsh punishment. China also considered the United States’s campaigns and support of human rights to be an extension of America’s imperialistic attitudes.

Twenty-First-Century Developments

Individual rights, judicial reform, and environmental justice continue to be subjects for academic discourse and also popular journalism in China. There are Chinese as well as Westerners blogging and discussing human rights online. Chinese people remain sensitive to unfair criticism by Western powers whose own record is not pristine.

This sensitivity was marked during the Tibetan riots and the Olympic torch relay controversy in spring 2008. Instead of being swayed by Western protesters, many Chinese argued that Westerners were hypocritical, ignorant of history, and culturally chauvinistic in their readiness to impose their values and perspectives. This situation typifies much of the human rights debate, as neither side seemed able to understand and acknowledge the underlying convictions of the other.

Western clumsiness often reminds the Chinese of past intrusions and the long imposition of Western controls on Chinese society and economy, and suggests to many Chinese that Western nations simply want an excuse to keep China from taking its rightful place in the world. Discussion of relations with China changed in tone, however, after the global economic crisis began in late 2008. Both Secretary of State Hillary Clinton and UK foreign secretary David Miliband have expressed a desire to develop a new spirit of cooperation with China, with a focus on the
global economy and but also mentioning climate change cooperation and human rights as priorities.

A human rights manifesto Lingba Xian-zhang, known as Charter 08, was published on 10 December 2008, the sixtieth anniversary of the Universal Declaration of Human Rights, and signed by some three hundred Chinese intellectuals, scholars, and activists. Its call for free speech and free elections has support inside and outside China, but whether such an approach will lead to substantial change is uncertain. Awareness of individual and human rights issues is growing, in any case. While U.S. and international organizations such as Amnesty International, Human Rights Watch, and Human Rights in China continue to monitor activities in China, the Chinese government has established its own NGOs, the China Foundation for Human Rights Development and the China Society for Human Rights Studies. It has begun a new dialogue with the Dalai Lama, and showed more openness in the aftermath of the 2008 Sichuan earthquake. There are also independent civil society organizations involved in this area, and the Internet creates new opportunities for individuals to express their views and to communicate directly with one another about human rights. The resurgent interest in Confucian values is also providing a way for China to define human rights on its own terms, but considerable challenges remain in bridging the real and perceived differences about what human rights are and should be in the twenty-first century.

Humor

The use of humor is as common in China as it is elsewhere in the world. From the ancient philosophers to contemporary television, from political satire to regional insults, humor has always been a part of Chinese culture.

Playful writing and amusing anecdotes survive from China’s earliest times, and they continued to be produced throughout the imperial era (221 BCE–1912 CE). As in other cultures, humor has served a variety of purposes in Chinese history, including entertainment, cultural criticism, personal denigration, and bolstering group solidarity against outsiders. It is important to study humor, therefore, for a fuller appreciation of the complexity, tensions, and joys of Chinese life over the ages.

Zhuangzi on Confucius

The most famous and influential humorist of ancient China was the philosopher Zhuangzi (Chuang Tzu, 369–286 BCE), whose eponymous writings are considered one of the two primary texts of Daoism (the other being the mystical Daodejing). Zhuangzi used playful parables, parody, and clever wordplay to mock other philosophers’ beliefs in the power of human reason. According to Zhuangzi, people’s understanding of the world is always restricted by their own limited perspective, just as a frog in a well cannot see more than a small patch of the sky or a sleeping man has no way of knowing that he is not the butterfly he dreams himself to be. Zhuangzi’s stories have delighted Chinese readers for generations and served as models of humorous writing.

A chief target of Zhuangzi’s wit was an earlier prominent philosopher, Confucius (551–479 BCE). In contrast to Daoists like Zhuangzi, who believed in living in intuitive harmony with the natural order, Confucius promoted a strict code of ethics and social hierarchy. Confucius is often depicted as a rather stern teacher, but there is evidence in the conversations with his disciples recorded in the Analects that he, too, had a sense of humor. One of the most amusing images from ancient China was actually produced to illustrate the Confucian ethical principle that one should be respectful to one’s parents: A stone carving in the funeral shrine of the Confucian scholar Wu Liang, constructed during the second century CE, relates the well-known story of a seventy-year-old filial son persuading his even more elderly parents that they are still young by acting like an infant.

Confucianism and Humor

Since the Han dynasty (206 BCE–220 CE), Confucianism has tended to dismiss humor, seeing it as incompatible with sincere devotion to ethical principles. The female historian and writer Ban Zhao (c. 45–116 CE) stated that a good woman should shun jokes and laughter and solemnly devote herself to serving her husband and his parents. Some Confucian scholars criticized as frivolous all humorous popular novels and plays, which were often banned by governments that tended to adopt the most rigid Confucian perspective.
on humor as subversive of the social order. Even whimsical poetry did not escape the attacks of sterner Confucian critics in the late imperial era (1368–1912), who saw it as a waste of time that instead should be spent studying history and promoting morality.

The question of the value of humor was never definitively settled within the Confucian tradition, however, and Confucian thought continuously coexisted and interacted with other schools of thought (such as Daoism) that did appreciate humor. Buddhism came to China during the Han dynasty, and the Chan school of Buddhism made use of the “shock effect” of humorous and absurd images to bring about knowledge, much as Zhuangzi used humor to question rationality. The use of amusing yet incongruous images for their shock value was borrowed by poets in the Song dynasty (960–1279) and later periods.

**Humor in Periods of Unrest**

Advances in printing and publishing beginning circa 1100 in the Song period (960–1279) contributed to the wider dissemination of humorous literature in China. Two periods of political unrest and technological change in later Chinese history produced a flood of writing that spanned the spectrum from escapist entertainment to harsh satire: the early seventeenth century, when the Ming dynasty (1368–1644) was in decline; and the Republican period between the fall of the Qing dynasty (1912) and the founding of the People’s Republic of China (1949). In the earlier period, occasional bawdy and erotic novels, such as *Jinpingmei* (*Golden Lotus*), and comic short stories, such as those collected by Feng Menglong (1574–1646), were immensely popular. During the 1920s and 1930s, China’s greatest satirist, Lu Xun (1881–1936), criticized Chinese society and politics in essays and short stories published in some of the hundreds of newspapers and literary journals that appeared in those years; he also promoted woodblock printing and satirical cartoons that the illiterate masses could understand. Also during this period, the writer Lin Yutang (1895–1976) introduced the English word “humor” into the Chinese language and argued that China needed more of it.

During the era of Mao Zedong (1949–1976), and particularly during the Cultural Revolution (1966–1976), sincere revolutionary fervor was held up by the Communist Party as the only proper attitude toward life. Humor did not entirely die out, but it was politically dangerous.

**Humor Themes**

The themes of Chinese humor often resemble those in other parts of the world: Published joke books abound with stereotypical characters such as the henpecked husband and the lusty widow. Confucian and Buddhist institutions and thought are also popular objects of humor, especially in plays and operas that existed prior to the twentieth century. Residents of one part of China often make fun of those of another, but this sort of regional humor and jokes about foreigners are not as prominent in China as humor involving ethnicity and nationality is in Europe and North America. Instead, the nature of the Chinese language, which has a relatively small
number of different sounds, encourages puns and wordplay. These are particularly common in the performance humor called *xiangsheng*, which resembles vaudeville dialogue.

**Humor Today**

The decades of the 1980s and 1990s, during which ideological orthodoxy disintegrated in the People’s Republic of China (PRC) and the use of the Internet mushroomed, may have been the beginning of another great age of humor in Chinese history. A growing appetite for humor in the PRC led publishers to comb traditional literature and excerpt the funny bits in best-selling anthologies. Lin Yutang’s writings from the 1920s and 1930s are enjoying new popularity, and the television sitcom has become a well-established form in the PRC. Chinese bloggers experiment with the full array of humor, visual and textual, on the Web, keeping the government’s Internet censors busy removing anything deemed subversive. Much of the online humor, political or otherwise, has made its way onto sites outside of China managed by overseas Chinese. In this way Chinese humor is increasingly global.

Hunan Province

Húnán Shěng 湖南省

63.55 million est. 2007 pop. 210,000 square km

The southern inland province of Hunan, about twice the size of Iceland, is well-known for its natural beauty, agricultural products (it is China’s largest producer of rice), cuisine, history, tourist attractions, and native citizens, notably Mao Zedong. It is a province rich in natural resources, although these are under considerable strain.

Hunan Province is located in south central China in the middle reaches of the Yangzi (Chang) River. The province has an area of 210,000 square kilometers (approximately twice the size of Iceland, although with over 200 times the population), with 136 counties and 13 cities. The provincial capital is Changsha (estimated 2007 population 6.53 million), a city recognized in Chinese history for more than 3,000 years; today it is a major river port on the Xiang River and commercial center. More than fifty minorities, including Miao, Tujia, Yao, and Hui, live in Hunan, but the majority of the population is Han Chinese.

The name “Hunan” comes from the fact that most of the province is located south of Dongting Lake, the second largest freshwater lake in China (after Poyang Lake): hu means “lake” and nan translates as “south.” The longest river within Hunan Province is the Xiang River; because of this “Xiang” is often used as an abbreviation for Hunan.

With Dongting Lake to the north, the remainder of the province is surrounded by mountains and hills: the Wuling Mountains to the northeast, the Xuefeng Mountains to the west, the Nanling Mountains to the south, and the Luoxiao Mountains to the east.

The economy of Hunan is primarily agricultural; it is sometimes called “a land of fish and rice” because many of its products (such as rice, tea, corn, sweet potatoes, barley, potatoes, buckwheat, rapeseed, fruits, and tobacco leaf) are considered the best in the country. Hunan is the largest producer in China of rice, the second largest producer of tea, and the third largest producer of oranges. The Dongting Lake area has been important for its supply of freshwater fish; it is also a major center for the production of ramie, one of the world’s oldest fiber crops. However, the Dongting Lake, one of the most famous lakes in Chinese history, has been polluted by a number of companies near the lake. Since 2001, the lake’s water has ranked the fifth degree level, meaning that almost no wildlife is able to survive. (A first degree level means no pollution while a fifth degree level means severe pollution in which wildlife is unable to live.)

Hunan cuisine is justifiably admired around the world. Like Szechuan cuisine from neighboring Sichuan Province to the west, Hunan cuisine is very spicy, making considerable use of chile peppers. Because Hunan is quite distant from the sea, with access to freshwater fish but not much seafood, Hunan cooks tend to use a lot of rice, meat, bean curd, mushrooms, bamboo shoots, and forest products. Elaborate preparation is also a hallmark of Hunan cookery.
Tourist Destination

Hunan Province has become a popular tourist destination as a result of its natural beauty. In addition, about 900 historic sites exist in Hunan Province, some of them dating back 8,000 years.

In 1988, the Chinese government established its first national forest in western Hunan—Zhangjiajie National Forest Park. Making up part of the Wulingyuan Scenic and Historic Interest Area, the forest park is well-known for its quartz-sandstone rock formations, sculpted through erosion and set among a forest of dense green with frequent inundations by clouds. The entire park is covered with more than 3,000 sandstone pillars (many more than 200 meters high), as well as caves, pools, waterfalls, streams, and other natural wonders. It was recognized by the United Nations Educational, Scientific, and Cultural Organization (UNESCO) in 1992 as a World Natural Heritage Site.

In southern Hunan, Mount Heng of the South is one of the five sacred mountains of Daoism, but it is also a sacred mountain to Buddhists; its summer resorts are also popular with people seeking mental and psychological treatment. To the north, Dongting Lake is frequently mist-covered in the early morning and very picturesque, despite its pollution. Located on the shores of Dongting Lake, Yueyang City is home to one of China’s most famous towers, the Yueyang Pavilion. Originally built during the Tang dynasty (618–907 CE), the unique architecture of
this three-story building has attracted not only tourists, but poets and romantic scholars for a thousand years. To the east is Mawangdui, an archeological site containing the tombs of an aristocratic family dating from the Han dynasty (206 BCE–220 CE). Excavated in the early 1970s, thousands of relics have been unearthed, many preserved in near-perfect condition, including a mummified two-thousand-year-old female body.

Hunan is also the birthplace of a number of well known figures in Chinese history, including the poet Qu Yuan (340–278 BCE); the supposed inventor of paper, Cai Lun (50–121 CE); the painter Qi Baishi (1864–1957); and several twentieth-century revolutionaries and politicians of the People’s Republic of China, most notably Mao Zedong (1893–1976), but also Liu Shaoqi (1898–1969), Peng Dehuai (1898–1974), Ren Bishi (1904–1950), He Long (1896–1969) and Zhu Rongji (b. 1928). Today, Shaoshan, where Mao was born, is a historic site for the Chinese Communist Party.

臭名远扬
Chou ming yuan yang
The “Hundred Days Reform” was an effort, over the summer of 1898, by the young emperor Guang Xu and many young Confucian scholar officials to introduce much-needed reforms to Qing dynasty China following the country’s defeat by Japan in the First Sino-Japanese War. It was put down by the dowager empress Xici.

Defeat by Japan in the First Sino-Japanese War (1894–1895) greatly affected the Qing dynasty (1644–1912) government of China and many young Chinese Confucian scholars. Some of these scholar-officials, particularly Kang Youwei (1858–1927) and Liang Qichao (1873–1929), called for dramatic changes in the structure of government, the examination system for entrance into government service, and the relationship of the government to the Chinese people, although they clothed these changes in traditional Confucian principles.

The young emperor, Guang Xu (1871–1908), was caught up in the fervor for reform and committed himself to carrying out a comprehensive reform program for approximately one hundred days, hence the phrase “Hundred Days Reform.” From mid-June to mid-September 1898, the emperor issued some forty reform decrees. The decrees called for educational reform by replacing the centuries-old “eight-legged” essays—a rigid, codified set of exams that for centuries had been the standard for entry into the civil service—with an exam that better

Kang Youwei, a prominent scholar and reformer of the late Qing dynasty, called for dramatic changes in the structure of government, the examination system for entrance into government service, and the relationship of the government to the Chinese people.
reflected current affairs, establishing an Imperial university, and initiating classes in foreign affairs and languages, economics, medicine, and the sciences. The decrees also sought changes in government and streamlining administration. Finally, the decrees called for government support for building railways, developing the economy, and improving the capital city, as well as providing government protection of missionaries, simplifying legal codes, and preparing an annual budget. These measures were designed primarily to reform the government, but also had the aim of impressing foreign powers in order to slow down the pace of foreign encroachments on Chinese sovereignty.

Predictably, there was backlash. The empress dowager, Cixi (1835–1908), allied with conservative elements in the Imperial City and across the nation and prepared a counterstrike. Rumors of a coup had floated around Beijing for days, and as the emperor moved slowly, the empress dowager and her allies moved quickly. On 21 September 1898, she seized control of the emperor, announced that he was incapacitated, took over all reform documents, and seized control of the government. Many of the reformers were arrested and executed, but Kang and Liang managed to escape. The reforms were undone, and one outcome was the so-called Boxer Rebellion, which accelerated foreign encroachments on China.

Whether the Hundred Days Reform was too comprehensive or too radical remains secondary to their short-term failure, but the seeds they planted were felt in the form of more gradual reforms as well as rebellions that would shape China’s history into the twentieth century.

The Hundred Flowers Campaign was an intense, but short-lived, period that encouraged open criticism and discussion of the Communist regime in the otherwise tightly controlled intellectual climate of 1950s China. It resulted in another campaign aimed to purge those considered to be at the “right” of the party.

In May 1956 Mao Zedong (1893–1976), leader of the People’s Republic of China, announced that the government would relax its strict control over thought and expression. The policy later became known as the Hundred Flowers Campaign, or Hundred Flowers Movement. The new freedoms promised under the campaign, however, lasted only a little more than a year.

As part of the campaign, Mao invited intellectuals to voice their criticism of party and government policies and leaders. The intellectuals, especially educators, had lost faith in the Chinese Communist Party (CCP) after it introduced a Soviet-style education system to China in the early 1950s. Under this system liberal arts education was discarded in favor of science and technology education. Mao thought to win over the alienated intellectuals by giving them a degree of intellectual freedom. For example, intellectuals who worked in schools, colleges, and universities were given more access to foreign publications.

The campaign was slow to catch on. Leaders within the party resisted the possibility of criticism. The intellectuals were reluctant to criticize the government for fear of reprisals. It was only in the spring of 1957, after Mao made a desperate plea to get the campaign moving with the slogan “Let a hundred flowers bloom and a hundred schools of thought contend,” that members of political parties, writers, journalists, teachers, and professionals began to openly criticize Communist rule, government policy, and party members. (The phrase “a hundred schools of thought” reverberates throughout China’s history in reference to the myriad philosophies, from Confucianism to Daoism to Legalism and more, that proliferated during the Warring States period 475–221 BCE.) In some extreme cases, wall posters appeared in public attacking the entire Communist system. Some people even publicly questioned the legitimacy of CCP rule. Mao and other party leaders were not prepared for the volume and intensity of the criticism.

By early July, just five weeks after the inauguration of the campaign, the party launched the dramatic new Anti-Rightist Campaign that shifted the target of criticism from the Communists to the intellectuals. Critics of the regime were themselves severely criticized by party members. An estimated 500,000–750,000 intellectuals were denounced or blacklisted. Some were arrested, and many were sent to the countryside to “rectify their thinking through labor.” In 1979, three years after the death of Mao, Deng Xiaoping (1904–1997), the new leader of the CCP, finally restored a “decent name” to (i.e., rehabilitated) these vilified intellectuals, but the damage had
Mao Zedong introduces the “Hundred Flowers”

These notes from Mao’s speech to the Politburo on 25 April 1956 are the first published reference attributed to Mao on the policy of “letting a hundred flowers bloom.”

In their speeches [many comrades] displayed a lack of vigor. The relationship of the low-level [cadres] to the upper-level [cadres] is like that of a mouse when it sees a cat, as though its soul has been eaten away. There was so much [on their minds], they didn’t dare speak out. This same problem of a lack of democracy also exist in the various provinces. However, there were some model workers who did speak out quite spiritedly. Our Financial and Economic [Work] Conference and the Fourth Plenum of the Central Committee had some side effects. Because of several stipulations, people did not venture to speak their minds. At the Economic and Financial [Work] Conference, certain comrades did not give appropriate speeches, and there were some who didn’t dare speak up at all…

We must delegate certain powers to the lower levels. Our [system of] discipline has come mostly from the Soviet Union. If the discipline is too strict, we will be fettering people. It is not possible to smash bureaucratism this way. The dictatorship of the proletariat requires an appropriate system. The Political Bureau and the State Council have not yet decided on either the problem of the division of power between the central government and the local areas, or how to the one-person management system of the Soviet Union came about. The various provinces should share power, they should not be afraid of being called people who clamor for independence. As the Center has not yet arrived at a decision, we are free to speak up. Every locality can draw up on its own regulations, bylaws, and methods as provided for by the Constitution. We must enable the various localities to be creative, spirited, and full of vigor. Beginning next year, we should convene a large conference annually…

In art and literature, to “let a hundred flowers bloom,” and in academic studies, to “let a hundred schools of thought contend” (as a hundred schools contended during the Spring and Autumn period and Warring States period) should be taken as a guideline. This was the view of the people two thousand years ago.

Already been done. Mao’s distrust of the intelligentsia had a long-standing effect on China’s efforts at modernization efforts.

During the Warring States period (475–221 BCE) many diverse philosophical systems thrived in China; the expression a hundred schools of thought is used to refer to their sheer number and diversity. The most prevalent schools included Confucianism, Mohism, Legalism, the School of Names, the Yin–Yang School, and Daoism.

The expression a hundred schools of thought was created to convey the idea that during the Warring States period (475–221 BCE) there were a large number of diverse philosophical systems, or schools of thought, in China. Records of the Grand Historian (c. 99–98 BCE) by Sima Qian (145–86? BCE) lists the following six: Confucianism, Mohism, Legalism, the School of Names, the Yin–Yang School, and Daoism. Written at about the same time as the Records of the Grand Historian, the Zhuangzi, Chapter 33, provides a Daoist, satirical description of these schools. In the Standard History of the Former Han by Ban Gu (32–92 CE), the “Journal of Literature” written by Liu Xin (d. 23 CE) adds four more groups—namely, Agriculturalists, Diplomats, Eclectic School, and Storytellers. Even a list of ten schools is incomplete because it does not include the Militarists, made famous by Sunzi’s Art of War, or the Pacifists, represented by Song Rongzi. And a school could have subdivisions—for example, there were subschools of Confucianism, Mohism, and Daoism. Some of the schools were not strictly philosophical—namely, the Agriculturalists, the Diplomats, and many of the texts classified under the Eclectic School. Numbering the schools at a hundred might be an overestimation, but the expression evokes a period of Chinese history in which philosophical thinking was arguably at its most formative.

Social Changes

When the Zhou overthrew the Shang dynasty (1766–1045 BCE) they gave fiefs to family members and a few local chiefs who assisted them. After the Zhou capital was moved eastward in 770 BCE, the dynastic power began to shift away from the Zhou house, and the feudal lords became more powerful as heads of independent states. During the Spring and Autumn period (770–476 BCE) there were as many as 170 mostly small states. By the Warring States period (475–221 BCE) there were only seven powerful states left on the battlefields. Toward the end of the Spring and Autumn period the feudal lords began to call themselves “kings.” When they competed for power, they created a context that allowed social mobility for commoners.

Iron came to China during the Spring and Autumn period, its use spreading during the Warring States period. Iron tools as well as irrigation, drainage, fertilizers, and new crops revolutionized agriculture. As the kings expanded their territories, they opened new agricultural lands. The surplus food helped grow the population, and the enlarged population provided more soldiers for the warring kingdoms. The use of iron and other developments in metallurgy improved military technology. Improvements in carriages and chariots and the rise of a cavalry changed military strategy and tactics. Surplus
produce and expanding tastes opened and maintained new trade routes by land and sea, allowing for more contact among cultures and the spread of ideas. The political, social, economic, and cultural changes that accelerated during the Warring States period provided a context for new philosophies to develop. The practice of universal education, even for commoners, that Confucius (551–479 BCE) had begun in the late Spring and Autumn period became popular during the Warring States period because of the growing need for highly trained knights, scholars, officials, and skilled craftspeople. As that need increased, there were more opportunities for commoners to gain wealth and even status.

Overall, the various philosophers agreed on a few general points. They all agreed that the state needed educated rulers and officials to operate effectively. This need inspired the philosophers to seek the Way (dao), a practical means to achieve desired results. Unlike the Greek philosophers who sought an abstract truth, the Warring States philosophers sought the best path to success. The philosophical tendency inspired a social movement away from privileged aristocratic birthrights to systems of worthy rulers and versatile ministers who were capable of administering the state, ensuring safety and a good harvest. Most of the Warring States philosophers proposed that all people—especially the ruler and ministers—had to adhere to their socially acquired roles. Everyone had to do his or her part for society to function properly. Most of the philosophers looked back to a past golden age to set a standard for complete and comprehensive harmony among people and with nature. Aside from these few general commonalities, for the most part the various philosophers disagreed about the means for achieving harmony and educating the ruler, ministers, and commoners.

**Confucius and Disciples**

Confucius believed that the Zhou imperial family and the feudal lords had lost the way of the former kings—especially the beneficent way of the Zhou founders: King Wen, King Wu, and the duke of Zhou. For Confucius the dao referred to the way of the former kings, the way of virtue. Confucius built his teachings on the popular idea of a past golden age of perfect social harmony. To reform society, he intended to revive the virtues and values of the past. Reform begins, he argued, in the ruling families and trickles down through aristocrats to commoners. Methodologically, Confucius’s teachings began by instilling filial piety in children. If children could not learn to love and respect their parents, then they would not become loyal ministers. Ontologically, Confucius held that all people are similar at birth—namely, they have the ability to be kind to others. Through improper training, they lose their natural propensity toward kindness. Therefore, childhood training in filial devotion was necessary to develop and maintain the natural propensity toward benevolence. These teachings promoted a type of graded love, in which a person loves close relatives more dearly than distant ones and fellow villagers more than strangers.

Another way to ward off social decay, according to Confucius, was moral education. Ritual action (li) was the proper way to promote human kindness (ren); all people and especially government officials had to demonstrate trustworthiness (xin); people had to follow the correct standards of rightness (yi); they had to practice moral wisdom (zhi). These tenets of moral education were commonly called the “five virtues”; there were many more. Through moral education people learned their role in society and behaved accordingly with virtue. The outcome would be a well-rounded individual and, ultimately, peace in the empire.

The disciples of Confucius emphasized different aspects of his teachings. The third-generation disciple Mengzi, also known as “Mencius” (371–289 BCE), advocated that all people are naturally good at birth. Mengzi interpreted the concept of the Mandate of Heaven, the divine sanction to rule, to include the right of peasants to rebel. As a champion of the Confucian way, Mengzi debated the followers of the individualist Yang Zhu, the Agriculturalists, the Militarists, and the Mohists. His interpretation of Confucius was revitalized in Song dynasty (960–1279 CE) neo-Confucianism.

Xunzi (c. 300–230 BCE) offered a pragmatic interpretation of Confucius. He proposed that people are born deviant and that education and ritual action are the means to control them. Xunzi argued that ancient records were in error and that a wise ruler should follow the way of the later, more recent kings, not the former kings. His teachings influenced the development of Confucianism in the Han dynasty.

Mozi, or Master Mo (flourished 479–438 BCE), probably began his studies as a Confucian. Trained in military
strategy and tactics, he defended the underdog. He attracted many disciples, possibly three hundred in his lifetime, and many subsequent followers. Like Confucius, Mozi believed that the way of the former kings and moral education were the correct means to rectify social decay, but he attacked the details of Confucius’s project. For Mozi social decay was caused by advocating family values and graded love, two concepts praised by Confucius. To correct the social decay, Mozi argued that the way of the former kings led to equal love for each and every person (jianai): If all people love each other in the same manner that they love their parents, then all strife will come to an end, and there will be peace in the empire. To promote the general welfare, Mozi advocated frugality in state functions. He opposed the excesses of aristocratic funerals and musical performances, which the common people imitated. Mozi attacked offensive warfare as the clearest indication of how graded love brings misery to the masses. He argued against fatalism. He supported promotion based on merit. With the meritorious in office, he advocated for deferring to the superior’s opinion.

**Legalists**

The Legalists were influenced by the agrarian and military roots of ancient society. They acknowledged that society needed reform so that it could establish peace based on law and order. They argued that Confucianism and Mohism, which promoted morality over the law, were the problem because morality justified protecting special interests, not the law. As the Western Zhou dynasty (1045–771 BCE) incorporated various ethnic groups and expanded economically, the need for legal governance grew. The end of the Spring and Autumn period saw written laws such as Zi Chan’s penal code (c. 536 BCE) and Deng Xi’s bamboo code (c. 496 BCE) cast in iron. Guan Zhong (d. 645 BCE), prime minister to the state of Qi, emphasized the need for a well-ordered state administration. Gongsun Yang, or Lord Shang (d. 338 BCE), stressed the importance of written, objective law applied equally to commoners and nobility. The prime minister of the state of Han, Shen Buhai (d. 337 BCE), taught the importance of statecraft, political techniques, and methods. Shen Dao (350–275 BCE), from the state of Zhao, stressed the importance of strategic position and the contextual circumstances that go into creating and maintaining political power. Shen Dao’s Legalism influenced Han Fei (d. 233 BCE), who with Li Si (c. 280–208 BCE) studied under the Confucian Xunzi. Both Han Fei and Li Si went to the state of Qin to assist Lü Buwei, prime minister to the child king who would become the first Qin emperor. Han Fei’s teachings synthesized earlier Legalist thought—especially the concepts of law, power, and statecraft. Han Fei attacked the Confucians and Mohists for claiming to represent the moral way of the early sage rulers while explicitly differing about the details of that way. He criticized their morality and favored the objective law and legal system.

**School of Names**

The School of Names, or Logicians (sometimes called “Sophists”), originated among the officials who allocated rewards and punishments to the lower officials and common people. They assessed people’s job titles and performance. Assessing job titles and performance transformed linking name and reality into a philosophical concern.
Because debate at court was the means by which philosophers gained fame and a livelihood, argumentation and rhetoric were emphasized by all the schools, but the Logicians took rational inquiry into the nature of language to the paradoxical realm. Hui Shi (c. 380–305 BCE) served as prime minister to King Hui of Liang (reigned 373–320 BCE). Hui Shi with his friend Zhuangzi argued that all things form a grand unity. Hui Shi sought to know that unity through reason and language; Zhuangzi, through direct experience. Gongsun Long (c. 310–250 BCE) was born in Zhao. Favored for a time by Prince Pingyuan (d. c. 251 BCE) in Zhao, Gongsun Long acquired fame by arguing that a white horse is not a horse. He might have meant that people ought not to confuse primary qualities (horse) with secondary qualities (color), or he might have been making a part/whole, individual/category distinction.

Yin–Yang School

In grappling with the forces of nature, people demarcate bipolar, interconnected yet opposing phenomena such as high/low, heavy/light, dry/damp, hot/cold, bright/dark. This kind of correlative thinking underlies most Chinese philosophy. In early Zhou literature the term yin referred to the shadow and the term yang to the sunlight. By the Warring States period yin and yang were used as philosophical concepts in the written works Laozi, Zhuangzi, and Xunzi to refer to the interconnected yet opposing forces of the universe. Yang is associated with heaven, light, movement, the male gender, and life-giving forces. Yin is associated with earth, darkness, tranquility, the female, decay, and death. These two forces are interconnected and contain each other such that when yin is exhausted, then yang arises and vice versa. Yin and yang are not a duality. They constitute a nondual energy force very similar to the positive and negative charges in the electro-magnetic spectrum. Yin and yang are used to explain why and how things change. They are coupled with the Five Phases (wuxing) — namely, wood, fire, earth, metal, and water.

Little is known about the founder of the Yin–Yang School, the scholar Zou Yan (305–240 BCE) from the state of Qi. He attempted to rectify the inferior virtue of rulers by instructing them in the processes of change through yin, yang, and the Five Phases. He linked his naturalistic philosophy to the Confucian virtues to develop a political theory, based on the study of natural phenomena, that culminates in the ruler’s cultivation of virtue.

Daoism

If the Confucians established the cultural tradition, then the Daoists formed the counterculture movement. Whereas most philosophers sought fame for themselves, the Daoists wanted to be anonymous. Daoist philosophy originated in ancient shaman—that is, priestly, magical—practices in which the shaman wanders in the spirit realm and merges with the forces of nature. In the Zhou dynasty these shamanic practices were modified into breathing and meditative techniques.

The Laozi and the Zhuangzi are the two extant texts from the Warring States period that form Daoism’s core. Laozi, also known as “Lao Dan” or “Master Lao,” was the founder of the Mohist school, a popular alternative to Confucian teachings.

Mozi, the founder of the Mohist school, a popular alternative to Confucian teachings.
born in the state of Chu in the sixth century BCE and is the alleged author of eighty-one poems that bear his name. The text of *Laozi* was written by court officials who sought to advise their ruler and other officials on the proper way to govern by means of self-cultivation that connects humans to the forces of nature. Along with the dao, sky, and earth, the king is one of the four great things in existence. People take earth as their model; earth follows sky; sky follows dao; and dao follows self-so (spontaneity). The ruler is encouraged to behave like the dao by taking no purposive action; as a result nothing will be left undone. Laozi’s contribution to ancient philosophy was his ability to abstract the dao into the most general and ultimate category.

Zhuang Zhou (370–301 BCE) was a minor official in the state of Song. According to his biography in the *Records of the Grand Historian*, he rejected an invitation by King Wei of Chu (reigned 339–329 BCE) to serve as prime minister. He is the alleged author of the first seven, or inner, chapters of his namesake book, the *Zhuangzi*. Those chapters focus on the theme of self-cultivation by embracing the flow of natural transformation, which ultimately leads to entering the silent oneness of the sky, a mystical union. Living in harmony with the forces of nature and the dao and then dying in harmony with nature lead to the ultimate mystical experience of forming one body with the universe. Zhuangzi emphasized the importance of the human role in living in harmony with the flux of life. He recognized that people are preoccupied with others’ opinions, so they work hard, live in distress, and die young. He proposed that people engage in meditative practices that purify their hearts and reduce stress and conflict, bringing them into harmony with the dao of nature. The text is written in fable and anecdote, making it difficult to interpret.

**Agriculturists**

During the Warring States period most public and private wealth derived from grain and silk. Though the Agriculturists’ works no longer exist, given that Mengzi debated the followers of Xu Xing (c. late fourth century BCE), the Agriculturists were a force to be reckoned with. They advocated a well-rounded agrarian philosophy, dealing with the best means for planting, weeding, and harvesting; promoting cottage industry and price controls; and organizing people in small agrarian work forces. Two of their lasting contributions to the economics of agriculture are the ever-ready granary system and the principle of acting (buying/selling) at the right time.

**Diplomats**

The Diplomats, or Strategists, were concerned with political alliances during the Warring States period. The name of the school refers to vertical versus horizontal alliances. For the Diplomats the way of the former kings was political and military strategy. Zhang Yi (flourished third century BCE) supported a vertical, south-to-north alliance between the states of Qin, Han, and Wei to attack Qi in the east and Chu in the south. Su Qin (flourished third century BCE) supported an alliance in the east to control Qin in the west. The Diplomats were criticized by the Confucians for proposing violent means instead of virtue and ritual to mediate conflict.

**Eclectic School**

The first three texts—the *Shizi*, the *Lüshi chunqiu*, and the *Huainanzi*—listed under the “Eclectic School” label in the “Journal of Literature” are philosophical works that employ a syncretic, unified eclectic philosophy, drawing from the other schools. The subsequent texts under that label are a miscellany. Therefore, confusion led some scholars to discredit the first three texts as a mere hodgepodge of literature. Yet the *Shizi* (c. 300 BCE), surviving in fragmentary form, displays a unified philosophy built on synthesizing other philosophies. The syncretic, unified philosophy of the *Lüshi chunqiu* (238 BCE) and the *Huainanzi* (130 BCE) is more obvious. The former organizes the philosophical systems under the seasonal calendar such that Yang Zhu’s individualism, Daoist nonaction, and Mohist love are practiced in the spring; Confucian education, ritual, and music are studied in the summer; military and legal affairs are reserved for the autumn; and Mohist frugal funerals as well as Legalist administrative matters and executions are suited for the winter. This eclectic trend influenced Han dynasty literature and philosophy.
Storytellers

Because rhetoric is sometimes more persuasive than logical argument, some scholars became adept storytellers. Confucians criticized their rhetoric for leading rulers astray from the way of the former kings. All of the philosophers employed stories as examples to make their point.

The Militarists are not listed among the other schools in the Han histories. But the military thinkers were given the honorary title of “master” (zi), which is bestowed on the philosophers. Sunzi (Sun Wu) lived during the end of the Spring and Autumn period. He was born in Qi but led the Wu troops. He is famous for his work on strategy, the Art of War, which is studied at military academies today. In 1972 another text called the Art of War, this one by Sun Bin, was excavated at Yinqueshan in Shandong Province. Sun Bin (flourished 350 BCE), a descendant of Sun Wu, emphasized military tactics. Both texts recognized the importance of developing moral virtues in the troops to bolster their loyalty, and both emphasized the importance of engaging only in just wars.

Further Reading

After the Warring States Period

The Warring States period was a turbulent yet important developmental stage for Chinese culture. Aspects of the various schools were absorbed into Han dynasty Confucianism, making it comprehensive and viable. Although Confucians disdained Legalism, the imperial Confucian state sponsored by the Han and subsequent dynasties could not have prospered without a legal system in addition to the system of ritual for controlling the masses and for diplomacy with other countries. Given the eclectic character of the subsequent development of Confucianism and Daoism, the Eclectic school left a lasting impression on Chinese philosophy.

Hungry Ghost Festival
Zhōngyuánjíé 中元节

Celebrants believe that during the annual Hungry Ghost Festival the gates of hell are thrown open, and ghosts are once again free to roam and may prey on the living. People hold feasts to fete both deities and ghosts.

Supplicants come to a temple in southern China to burn joss (incense) sticks to please their ancestors. They also bring food and drink to feed the hungry spirits.

roots in Chinese forms of social life, Daoist folk religion, and Buddhism. People believe that during the time of the festival the gates of hell (purgatory or the underworld) are thrown open, and ghosts—“good brothers”—are once again free to roam the realm of the living.

The Hungry Ghost Festival is an inauspicious time when hungry ghosts may prey on the living, driven by resentment and anger. Couples do not have weddings during this time, and people circulate ghost stories of mishaps and bad luck to keep the living alert. Particularly vulnerable are children, and parents are careful to prevent them from swimming in the open sea or camping in forests, for example.

To appease the ghosts, people make offerings outside of homes at nearby road junctions, country lanes, and open spaces. People also take care not to invite the ghosts into the homes. Clan and trade associations and neighborhood groups have more elaborate celebrations that last for a few days. They build temporary sheds in open spaces to house deities. The deities, made of papier-mâché, are burnt at the end of the festival. The chief deity—called “Phor Tor Kong” in the Hokkien language—is the keeper of purgatory who keeps watch over the wandering ghosts. People hold feasts to fete both deities and ghosts. An assortment of foods is laid out, including rice, noodles, meat dishes, sweet cakes, fruits, wine, and other drinks as well as joss sticks, paper money, and paper clothes. In addition, entertainment, such as traditional Chinese opera, singing bands, and open-air film showings, is provided. In addition to fulfilling ritual obligations, the Hungry Ghost Festival sometimes is used to raise funds and awareness to support concerns about the well-being of diasporic (scattered) Chinese communities, particularly concerning Chinese ethnicity, education, and culture.

Hutong are the narrow lanes and alleys (as well as the neighborhoods formed by them) in cities of north China. Hutong have become iconic symbols of Beijing, once an imperial capital and today an international city undergoing unprecedented change. In recent years, the conservation of the tangible and intangible aspects of hutong neighborhoods has met only limited success.

Beginning in the Yuan dynasty (1279–1368) when the imperial capital was Dadu, much of what is today called Beijing was laid out like a chessboard grid with neighborhoods defined by the presence of shared water wells or hutong, as they were known in the Mongol language. By extension, the associated narrow lanes and alleys as well as the neighborhoods formed by them, each with its own characteristics, came also to be called hutong. Running east to west and crossing those running north to south, the lanes and alleys were said to be “like ox hair” in that their number was beyond calculation.

Over a span of fourteen years early in the fifteenth century, Zhu Di, the third emperor of the Ming dynasty (1368–1644), moved the capital from Nanjing in the Yangzi (Chang) River basin back north to the site of Dadu but with a new name: Beijing. The construction of the magnificent complex known in English as the “Forbidden City” created a cosmic anchor around which the city grew.
was rebuilt, growing in an orderly and structured fashion comprising walled complexes and passages of various extents. Princes, high-ranking officials, and some wealthy merchants lived in expansive residences, many of which had access to water bodies, to the east and west of the imperial palaces. In this core area the connecting hutong were comparatively broad, with imposing gateways leading through high gray walls into expansive courtyard dwellings called siheyuan. First to the north and then later to the south of the Forbidden City, commoners—shopkeepers, artisans, and laborers—built simpler and smaller courtyard dwellings, fashioning in the process densely packed hutong neighborhoods along newly laid-out narrower, irregular, and sometimes winding lanes.

In the areas around the Imperial Palace the main hutong ran principally from east to west since the main residential buildings aligned along them typically were oriented so that their main rooms and gates faced south.

Linking these larger hutong, narrower alleys ran from north to south to provide shortcuts and access to residences as they were built. Over time, whatever traditional orderliness there once was, lanes and alleys came eventually to proliferate, even in a somewhat disorderly way, so that some hutong became mazelike in layout. Where once hutong were rigidly parallel in structure, meeting each other at right angles, smaller ones away from the imperial precincts often were irregular in width and length, becoming simply extended passageways. The Jiudaowan (Nine Turnings) hutong in the Dongcheng district, which actually has nineteen turns along its length, is even today an irregular, somewhat labyrinth-like, route of singular interest. Within the Qianmen area in the south of the city, the well-known Qianshi hutong is only 80 centimeters wide in one spot, insufficient for two persons to pass. Some extant hutong are nothing more than narrow alleys that lead fairly quickly to dead ends.

Throughout the twentieth century, but especially after 1949, as crowding occurred in old courtyard residences, hutong neighborhoods themselves increased in their overall residential density. Where once behind the walls of a capacious courtyard house lived a single family, now eight to ten families occupied the space, leading usually to the building of structures in once-open courtyards. Activities that once might have been confined within the dwelling increasingly spilled out into the lanes, where neighbors spent free time sitting on small stools in the alleys to read, chat, and watch children. The evolution of social communities, with markets and service facilities nearby, under these circumstances is striking. In spite of overcrowding, poor hygiene, leaky roofs, and lack of privacy, many in China today view hutong neighborhoods as quiet spaces with an idyllic atmosphere. In urban China there is much nostalgia for the quiet and community of traditional hutong life in the wake of the intrusion of automobiles and trucks into narrow lanes and the wholesale destruction of old neighborhoods.

In recent decades substantial portions of old Beijing have vanished in demolition that has, according to many observers, actually accelerated even as authorities claim that they have slowed the pace of destruction by enacting regulations to protect twenty-five hutong zones in the city. News reports and blogs regularly express outrage at wholesale demolition in areas said to be protected from destruction. Poignant tales of longtime, often elderly
families and neighbors uprooted from familiar surroundings with inadequate compensation are commonly repeated, especially as the city remade itself for the 2008 Summer Olympics. In 2006 a survey by the Beijing Institute of Civil Engineering and Architecture confirmed that only about 30 percent of hutong built prior to 1949 still existed, with most destruction having taken place in the 1990s and early 2000s. One sprawling neighborhood that has been undergoing gentrification is the Shichahai area, with its archipelago-like lakes, tree-lined esplanades, and bridges strewn along the western part of the Imperial City. Here hutong tours whisk foreign and domestic tourists in three-wheeled pedicabs along narrow lanes lined with old buildings in hopes of giving them a sense of the character of life in the old city. I Ching (Classic of Changes)

Yijing 易经

I Ching (Classic of Changes, also known as Yijing) 易經, the first of the Chinese Confucian classics, has profoundly shaped East Asian thought and culture and has also become influential among many intellectuals in the West. As a book about divination and the source of wisdom, it is both a repository of moral and political insight and a guide for individual self-fulfillment.

The I Ching (Classic of Changes, also known as the Yijing), one of the most widely consulted books in the Chinese tradition, had an incalculable influence throughout history and acquired a significant following even outside China in East Asia. Nowadays, besides those consulting it in its original language—often aided by translations into modern Chinese, Japanese, or Korean—thousands access it through translations into Western languages. Originally it was a manual of divination, and its oldest layers are traditionally attributed to King Wen and the duke of Zhou (eleventh century BCE). But modern scholarship regards its base texts as the product of anonymous and gradual compilation that reached its final form during the ninth century BCE. The Changes subsequently developed into a book of wisdom as it acquired a group of commentaries, the so-called Ten Wings (shiyi), traditionally attributed to the philosopher Confucius (551–479 BCE) but now reckoned of uncertain authorship dating mostly from the mid-third to the early second century BCE.

At the core of the Changes are sixty-four hexagrams (gua) and related texts: The hexagrams, formed by combinations of two trigrams (also gua), consist of six lines (yao) in vertical sequence, read from the bottom up. Lines are either solid (yang) or broken (yin), and their combination into sixty-four hexagrams is determined by numerical manipulation of divining sticks or the casting of coins. Each hexagram is assigned a name (guaming) indicative of the image (xiang) or abstract meaning of the hexagram statement (guaci) or “Judgment” (tuan), and each of the six lines has a line statement (yaoci) that contributes to the general topic of the Judgment and states a specific variation of it, often followed by an injunction to take or refrain from action, and often a final determination of “misfortune” or “good fortune.” The hexagrams, Judgments, and line statements are the oldest parts of the Changes and constitute the first chronological layer of a three-layered text.

Radical Reinterpretation

The original meaning of the Judgments and line statements, however, which were concerned with the mechanics of divination and its amoral consequences, was radically reinterpreted, either through ignorance or intent, by the exegesis (an explanation or critical interpretation of a text) of the “Ten Wings” to fit with Confucian morality; this reinterpretation shaped all subsequent

© 2009 by Berkshire Publishing Group LLC
interpretation—up to modern times. The second layer includes another two parts: “Commentary on the Judgments” (Tuanzhuan), which expands upon the Judgments, and “Commentary on the Images” (Xiangzhuan), which addresses both the “Great Images” (Daxiang) or abstract meaning of the Judgments and the “Little Images” (Xiaoxiang) of line statements. The Tuanzhuan and Xiangzhuan are each divided into two sections, together forming the first four of the “Ten Wings.” The fifth of the “Ten Wings,” “Commentary on the Words of the Text” (Wenyan), containing elements of the second and third layers, consists of two fragments of a lost commentary on the hexagrams as a whole. Only those parts concerned with the first two hexagrams, “Pure Yang” (Qian) and “Pure Yin” (Kun), survived, and these deal with the philosophical and ethical implications of the Judgments.

Diagrams from the I-Ching, (the Book of Changes). On the left is a Luo Shu diagram, on the right is a He Thu diagram. They represented a simple magic square and a cruciform array of the numbers from 1 to 10. Even or Yin numbers are represented in black and odd or Yang ones in white. The Luo Shu is a magic square in which the figures, added up along any diagonal, line or column, make 15, from which can be created a swastika symbol. The He Thu is arranged so that if the central 5 and 10 are ignored, both odd and even number sets add up to 20, a series of numbers which had symbolic attributions, for instance; the four seasons, five elements, etc.
based on Confucian thought. The sixth and seventh Wings are formed by the two parts of the “Commentary on the Appended Phrases” (Xi chi zhuon) or “Great Commentary” (Da zhuon). The first part is a group of essays on the general nature of the Changes; the second is a collection of remarks about the Judgments and line statements of individual hexagrams. The eighth of the “Ten Wings,” “Explaining the Trigrams” (Shuogua), addresses the meaning of the eight trigrams (bagua) in terms of yin-yang dualism and the theory of the five phases (wuxing), this indicative of early Han dynasty (206 BCE–220 CE) thought. The ninth Wing, “Providing the Sequence of the Hexagrams” (Xugua), addresses each of the hexagrams and justifies their order in terms of etymology and pseudo-rational argument—often farfetched. The tenth Wing, “Hexagrams in Irregular Order” (Zagua), consists of brief remarks that define the meaning of individual hexagrams, often in terms of contrasting pairs.

Hexagram divination—originally a method of consulting and influencing gods, spirits, and ancestors (the “powerful dead”)—with the Changes became a method of penetrating moments of the cosmic order to discern how the Dao as macrocosm is configured at such moments and to determine what one’s own microcosmic status in it should be. One thus averts wrong decisions, avoids failure, and escapes misfortune and instead makes right decisions, achieves success, and garners good fortune. The hexagrams represent sixty-four archetypal situations possible for the individual. The casting of sticks or coins determines six lines, either solid (yang) or broken (yin); lines can be either “old,” about to change from yang to yin or yin to yang, which warrants separate consideration when the hexagram is interpreted, or “new” and not about to change, thus disregarded when individual lines of a hexagram are interpreted.
Consulting Hexagrams

When a hexagram consists entirely of “new” lines, only the Judgment, “Commentary on the Judgments,” and “Commentary on the Images” are consulted. But if one or more “old” lines occur, the line statements and the “Commentary on the Images” for such lines are also consulted. Furthermore, the Judgment, “Commentary on the Judgments,” and “Commentary on the Images” of the “new” hexagram resulting from the change of “old” lines to “new” are also consulted. For example, if in casting Hexagram 36, Mingyi (Suppression of the Light) (yang, yin, yang, yin, yin, yin), the third yang line is “old” and about to turn into a “new” yin line, this results in Hexagram 24, Fu (Return) (yang, yin, yin, yin, yin, yin). In general, Mingyi represents an unstable situation, a weak position for the individual in it, and advises patience and restraint; Fu by contrast represents a stable situation, a strong position for the individual in it, and advises assertive action. However, consulting the Changes is a much more enriching experience than this. Those interested in the Swiss psychiatrist C. G. Jung’s reading of the Changes and its influence on him, especially on his theory of synchronicity, should read Jung’s foreword to Richard Wilhelm’s The I Ching or Book of Changes. Richard John Lynn’s The Classic of Changes: A New Translation of the I Ching as Interpreted by Wang Bi is recommended as an accurate translation based on the most important of the traditional Chinese philosophical commentaries.

India-China Relations

Zhōng-Yin wàijiāo guānxì 中印外交关系

Existing in close proximity for thousands of years, the ancient civilizations of China and India had surprisingly little political interaction for most of that time. The twentieth century saw tensions between the two increase over disputed borders and geopolitical competition for power, influence, resources, and markets. How the relationship will develop and play out is an important question in the twenty-first century.

As ancient civilizations, China and India coexisted in peace and harmony for millennia. But as post-colonial modern nation-states, with the exception of a very short period of bonhomie in the early 1950s, relations between the two Asian giants have been marked by conflict, containment, mutual suspicion, distrust, and rivalry. Just as the Indian subcontinental plate has a tendency to constantly rub and push against the Eurasian tectonic plate, causing friction and volatility in the entire Himalayan mountain range, India’s bilateral relationship with China also remains volatile and riddled with friction and tension.

Past Perfect: Ancient Civilizations

China and India are two of the world’s oldest civilizations, each with the quality of resilience that has enabled it to survive and prosper through the ages and against the odds. During the past three thousand years, every one of the Asian countries—some situated on the continental landmass, others being islands off the Asia mainland—has at some stage been directly influenced by one or both of these two great civilizations.

Both have long, rich strategic traditions: Both Kautilya’s Arthashastra—a treatise on war, diplomacy, statecraft, and empire—and Sunzi’s (Sun Tzu’s) Sunzi bingfa (The Art of War) were written over two thousand years ago in India and China, respectively. The traditional Chinese concept of international relations was based on concentric circles from the imperial capital outward through variously dependent states to the barbarians. It bears remarkable resemblance to the Indian concept of mandala, or circles, as outlined in Arthashastra, which postulated that a king’s neighbor is his natural enemy, while the king beyond his neighbor is his natural ally. The Chinese dynasties followed a similar policy of encircling and attacking nearby neighbors and maintaining friendly relations with more distant kingdoms (yuàn jiāo jìng gōng). Much like imperial China, tribute, homage, subservience—but not annexation—were the rightful fruits of victory in ancient India.

Political contacts between ancient China and India were few and far between. In the cultural sphere, it was mostly a one-way street—from India to China. Hindu and Buddhist religious and cultural influence spread to China through Central Asia, and Chinese scholars were sent to Indian universities at Nalanda and Taxilla. Though Chinese and Indian civilizations reacted to one another during the first few centuries of the Christian era,
the process of religious-cultural interaction ceased after about the tenth century CE (coinciding with the Islamic invasions of India). Since then, the two countries lived as if they were oblivious to each other's existence for over a thousand years, until about the advent of the nineteenth century, when both came under the influence of European powers.

Before the age of European colonization, China accounted for about 33 percent of the world’s manufactured goods and India for about 25 percent. China under the Song (960–1279) and Qing (1644–1912) dynasties was the world’s superpower. Under the Guptas (c. 320–c. 550 CE) and Mughals (1526–1857), India’s economic, military, and cultural prowess also was an object of envy. Then in a complete reversal of fortune, the mighty Asian civilizations declined, decayed, and disintegrated and were eventually conquered by European powers.

**Present Imperfect: From Civilizations to Nation-States**

The gradual westward expansion over the centuries under Mongol and Qing dynasties extended China’s influence over Tibet and parts of Central Asia (now Xinjiang province). In contrast, India’s boundaries shrank following the
1947 partition that broke up the subcontinent’s strategic unity that went back two thousand years to the first Maurya empire (c. 324–c. 200 BCE). Then came the Chinese occupation of Tibet in 1950; as a result the two nations came into close physical contact for the first time and clashed. India’s partition in 1947 and the Chinese occupation of Tibet in 1950 have allowed China to extend its reach and influence into a region where it had, in terms of history and civilization, previously exercised no influence at all.

China-India relations have been tense ever since a border dispute led to a full-scale war in 1962 and armed skirmishes in 1967 and 1987. Several rounds of talks held over more than a quarter of a century (since 1981) have failed to resolve the disputed claims. Agreements on maintaining peace and tranquility on the disputed border were signed in 1993 and 1996. An agreement on the guiding principles for settlement was concluded in 2005. However, China’s increasing assertiveness, as evidenced in increased incursions in Arunachal Pradesh by the People’s Liberation Army (PLA) since 2005, has led to a rapid meltdown in the Sino-Indian border talks, despite public protestations of amity. Apparently, the Chinese believe that a border settlement, without major Indian territorial concessions, could potentially augment India’s relative power position, and thus impact negatively on China’s rise. While Chinese insist on the return of Tawang (the birthplace of the sixth Dalai Lama) on religious grounds, Indians seek the return of the sacred Mount Kailash-Mansarovar in Tibet, since it is a sacred religious place associated with the Hindu religion. The consequence is that the 2,520-mile frontier between India and China, one of the longest interstate borders in the world, remains the only one of China’s land borders not defined, let alone demarcated, on maps or delineated on the ground. The prospects of a negotiated settlement in the near future seem as remote as ever for several reasons. An unsettled border provides China the strategic leverage to keep India uncertain about its intentions and nervous about its capabilities, while exposing India’s vulnerabilities and weaknesses and ensuring New Delhi’s “good behavior” on issues of vital concern to China. Furthermore, unless and until Beijing succeeds in totally pacifying and sinicizing Tibet (as Inner Mongolia has been), China does not want to give up the “bargaining chip” that an unsettled boundary vis-à-vis India provides it with. An unsettled boundary also suits Chinese interests for the present because China’s claims in the western sector are complicated by the India-Pakistan dispute over Kashmir, Pakistan’s interests in the Sino-Indian territorial dispute, and Beijing’s interest in keeping India under strategic pressure on two fronts.

Even if the territorial dispute was resolved, China and India would still retain a competitive relationship. Other factors, apart from the territorial dispute, contribute to the fractious and uneasy relationship. These include the nature of China’s ties with India’s smaller South Asian neighbors (including its arming of them); the legacy of Cold War alignments (Beijing-Islamabad-Washington versus the Moscow-New Delhi axis); continuing unrest in Tibet and Kashmir; Chinese encroachments into what India sees as its sphere of influence; Beijing’s plans for a naval presence in the Indian Ocean; resource competition; power asymmetry and a rivalry for the leadership of the developing world and multilateral forums; and, more recently, the nuclear and naval rivalries.

Since the days of Jawaharlal Nehru (1889–1964), independent India has entertained hopes of a joint Sino-Indian leadership of Asia as a counter to Western influence, but the Chinese have shown no enthusiasm for sharing leadership of Asia with anyone, least of all India. After all, the main objective of China’s Asia policy is to prevent the rise of a peer competitor to challenge its status as the Asia-Pacific’s sole “Middle Kingdom.” As an old Chinese saying goes, “one mountain cannot accommodate two tigers.” Checkmated in East Asia by three great powers—Russia, Japan, and the United States—Beijing has long seen South and Southeast Asia as its spheres of influence and India as the main obstacle to achieving its strategic objective of regional supremacy in mainland Asia. Chinese policymakers’ preference for a balance-of-power approach in interstate relations has led them to provide military and political support to those countries that can serve as counterweights to Beijing’s perceived enemies and rivals. Recognizing that strategic-rival India has the size, might, numbers, and, above all, the intention to match China, Beijing has long followed hexiao, gongda policy in South Asia: “uniting with the small (Pakistan, Bangladesh, Burma, Nepal, and Sri Lanka) to counter the big (India).”

For its part, India has always perceived the Sino-Pakistani nexus, in particular, as hostile and threatening in nature. As the pivotal power in South Asia, India
perceives itself much as China has traditionally perceived itself in relation to East Asia. That the “strategic space” in which India traditionally operated has become increasingly constricted due to Chinese penetration became further evident from Beijing’s forays into Myanmar (Burma) and the Bay of Bengal in the 1990s.

Historically and culturally India never played second fiddle to China. Therein lies the root cause of volatile and strained relationship: Seeing China as the reference point of India’s economic, security, and diplomatic policies, India’s strategic analysts have long emphasized the need to keep up with China militarily. Initially, India’s nuclear capability was aimed solely at deterring China, not Pakistan. It is the adversarial nature of the Sino-Indian relationship that has driven India’s and, in turn, Pakistan’s nuclear weapons programs. The 1998 Indian nuclear tests were preceded by the Indian defense minister George Fernandes’ statements that called China a “bigger potential threat” than Pakistan and described how his country was being “encircled” by Chinese military activities in Tibet and alliances with Pakistan and Myanmar. From New Delhi’s perspective, much of Beijing’s penetration deep into the South Asian region in the second half of the twentieth century has been primarily at India’s expense. At the heart of Sino-Indian antagonism is the Indian belief that China is seeking to deny India its proper stakes in the game of international politics. That China does not want India to emerge as an equal is evident from its opposition to India’s membership in the P-5 (UN Security Council), N-5 (Nuclear Club), ASEM (Asia-Europe Summit), APEC (Asia-Pacific Economic Cooperation), and EAS (East Asia Summit).

Both China (after a century) and India (after a millennium) of decline are keen to assume the great power roles they believe they have been their right in view of their histories and civilizations. Both have similar robust attributes of a strong power: massive manpower resources; a scientific, technological, and industrial base; and formidable armed forces. Both are nuclear and space powers with growing ambitions. When Chinese and Indian elites speak of restoring their country’s rightful place in the world, they give expression to a concept of preeminence in Asia and the wider world. This concept reflects their perception that as the foundation of regional cultural patterns, their rightful place is at the apex of world hierarchy.

The similarities between the two Asian giants’ outlooks, aspirations, policies, and interests are indeed striking, despite their differing political systems. Both want a new international status that is commensurate with their size, strength, and potential. Both identify the present pattern of international relations with a world order designed to perpetuate the world domination of Western powers. Both see Asia’s rise on the world stage as bringing about the end of Western dominance. Though uncomfortable with the U.S. dominance in world affairs, both are courting Washington to help balance their relationships with each other until they are strong enough to do so on their own. Both oppose the status quo: China in terms of territory, power, and influence; India in terms of status, power, and influence. Both yearn for a truly multipolar world that will provide them the space for growth and freedom of action that befits great powers. Both have practiced “tilted nonalignment” (during the Cold War China tilted toward the U.S. (1971–89) and India toward the USSR (1971–1991) while preaching independent, non-aligned foreign policies. Both vie for influence in Central, South, and Southeast Asia and for leadership positions in global and regional organizations. Each puts forward proposals for multilateral cooperation that deliberately exclude the other.

Both see themselves as great Asian powers whose time has finally come. Both have attempted to establish a sort of Monroe Doctrine in their neighborhoods without much success. Both claim that their attitude toward their neighbors is essentially benevolent, while making it clear that those neighbors must not make policies or take actions, or allow other nations to take measures in their countries, that each deems to be against its own interest and security. If they do so, China and India are willing to apply pressure in one fashion or another to bring about desired changes. Both are unable to reassert their traditional suzerainty (dominion) over their smaller neighbors, as any attempt to do so encounters resistance from regional and extra-regional powers. Both remain suspicious of each other’s long-term agenda and intentions. Each perceives the other as pursuing hegemony and entertaining imperial ambitions. Neither power is comfortable with the rise of the other. Both are locked in a classic security dilemma: One country sees its own actions as self-defensive, but the same actions appear aggressive to
the other. Both suffer from a siege mentality borne out of an acute consciousness of the divisive tendencies that make their countries’ present political unity so fragile. After all, much of Chinese and Indian history is made up of long periods of internal disunity and turmoil, when centrifugal forces brought down even the most powerful empires. Each has its weak point—regional conflicts, poverty, and religious divisions for India; the contradiction between a capitalist economy and Communist politics for China. Both are plagued with domestic linguistic, ethno-religious, and politico-economic troubles that could be their undoing if not managed properly.

China and India also share remarkable similarities in economic outlooks and policies. Both are focusing on increasing comprehensive national strength on a solid economic-technological base. Both are major competitors for foreign investment, capital, trade, resources, and markets. Burgeoning economic ties between the world’s two fastest-growing economies have become the most salient aspect of their bilateral relationship. Both have begun to behave like normal neighbors—allowing trade and investment and promoting people-to-people contact. Bilateral trade flows are rising rapidly (from a paltry $350 million in 1993 to $30 billion in 2007) and could cross $60 billion in 2009 and double again by 2015 (The Times of India, 2008). Several joint ventures in power generation, consumer goods, steel, chemicals, minerals, mining, transport, IT, and telecommunication are in the pipeline. Each is seeking to reintegrate its neighborhood with its national economy.
But in the economic sphere Chinese and Indian economies are still more competitive than complementary. Both look to the West and Japan for advanced technology, machinery, capital, and investment. Many Indians see China as predatory in trade and look with worry at China’s robust growth rates, fearing getting left behind. The Chinese economy is about 2.5 times greater than India’s, and China receives three times more foreign investment than India ($74.7 billion for China versus $23 billion for India in 2008) (Hiscock, 2008). China’s dramatic economic progress evokes envy, admiration, and a desire for emulation among Indians, who lament that whether China practices Communism (under Mao) or capitalism (post-Mao), it always does it better than India. Obviously, India has a lot of catching up to do in the economic sphere. Besides, the bulk of Indian exports to China consists of iron ore and other raw materials, while India imports mostly manufactured goods from China—a classic example of a dependency model. While China’s economic boom offers profit and opportunity, Beijing’s strategic ambitions and efforts to lock up a significant share of Central Asian, African, Latin American, Burmese, and Russian energy resources and minerals for China’s exclusive use generate suspicion, envy, and fear. India’s poor transportation infrastructure and frequent power shortages remain the Achilles’ heel of India’s fast-growing economy, hindering its ability to compete with China. In theory, the partnership of China’s awesome manufacturing power with India’s enviable information technology and services sector could make “Chindia” the factory and back office of the world. But the reality is that China wants to beat India in the services sector, too. As a March 2004 Beijing Review commentary put it, in the IT software sector, “[a] fierce face-off with an old competitor—India—has [just] begun.”

Despite ever-increasing trade volumes, there is as yet no strategic congruence between China and India. On almost all counts, the two Asian heavyweights clash or compete, and they are vulnerable to any deterioration in relations. Their burden of history, long memories, deep-rooted prejudice, tensions over unresolved territorial disputes, and global competition for natural resources and markets add to mutual distrust and tensions. Furthermore, Beijing worries that the logic and pull of geopolitics is pushing India, much like Japan, to a strategic alliance with the United States so as to contain China.

Future Tense

China and India’s strategic cultures require both to regain the power and status their leaders consider appropriate to their country’s size, population, geographical position, and historical heritage. There have been numerous occasions in history when China and India were simultaneously weak; there have been occasional moments of simultaneous cultural blossoming. But for more than half a millennium, Asia has not seen the two giants economically and militarily powerful at the same time. That time is now approaching fast, and it is likely to result in significant new geopolitical realignments. The emergence of China and India as economic giants undoubtedly will throw a huge new weight onto the world’s geopolitical balance. As India grows outwardly, the two giants are beginning to rub shoulders (or ruffle feathers) in different parts of Asia, Africa, and Latin America. New economic prosperity and military strength is reawakening nationalist pride in India, which could bring about a clash with Chinese nationalism. The existence of two economically powerful nations will create new tensions as they both strive to stamp their authority on the region.

In the power competition game, while China has surged ahead by acquiring economic and military capabilities underpinned by a clear policy to achieve broader strategic objectives, India has a lot of catching up to do. The existing asymmetry in international status and power serves Beijing’s interests very well; any attempt by India to challenge or undermine China’s power and influence or to achieve strategic parity is strongly resisted through a combination of military, economic, and diplomatic means.

More importantly, resource scarcity in the twenty-first century has now added a maritime dimension to the traditional Sino-Indian geopolitical rivalry. As India and China’s energy dependence on the Middle East and Africa increases, both are actively seeking to forge closer defense and security ties with resource-supplier nations, and to develop appropriate naval capabilities to control the sea lanes through which the bulk of their commerce flows. Nearly 90 percent of Chinese arms sales go to countries located in the Indian Ocean region. Beijing is investing heavily in developing the Gwadar deep-sea port in Pakistan, and naval bases in Sri Lanka, Bangladesh, and Myanmar. For its part, India has countered by
promoting defense cooperation with Oman and Israel in the west of India while upgrading military ties with the Maldives, Madagascar, Seychelles, and the United States in the Indian Ocean, and with Myanmar, Singapore, Indonesia, Thailand, Vietnam, Taiwan, the Philippines, Australia, Japan, and the United States in the east. Maritime competition is set to intensify as Indian and Chinese navies show off their flags in the Pacific and Indian oceans with greater frequency. Their maritime rivalry is likely to spill into the open in a couple of decades’ time when one Indian aircraft carrier will be deployed in the Pacific Ocean and one Chinese aircraft carrier in the Indian Ocean, ostensibly to safeguard their respective sea lanes of communication. Perhaps sooner rather than later, China’s military alliances and forward deployment of its naval assets in the Pakistani, Bangladeshi, Sri Lankan, and Myanmarese ports would prompt India to respond in kind by seeking access to ports in Vietnam (Cam Ranh Bay), Taiwan (Kao-hsiung), and Japan (Okinawa), which would allow for the forward deployment of Indian naval assets to protect India’s East Asian shipping and Pacific Ocean trade routes, as well as access to energy resources from the Russian Sakhalin province.

For the foreseeable future, India-China ties will remain fragile and as vulnerable as ever to sudden deterioration as a result of misperceptions, accidents, and eruption of unresolved issues. Simmering tensions over territory, overlapping spheres of influence, resource scarcity, and rival alliance relationships ensure that relations between the two rising Asian giants will be characterized more by competition and rivalry than cooperation for a long time to come. In the short to medium term, neither New Delhi nor Beijing will do anything that destabilizes their bilateral relationship or arouses the suspicions of their smaller Asian neighbors. Their efforts will be aimed at consolidating their power and position while striving to resolve more pressing domestic problems. But instability in Tibet, coupled with China’s military links with Pakistan and Myanmar, will pose a continuing complication in Sino-Indian relations. At the same time, both will continue to monitor closely each other’s activities to expand influence and gain advantage in the wider Asian region and will attempt to fill any perceived power vacuum or block the other from doing so. India, like China, would prefer to avoid entangling alliances so as to maximize its options and freedom of action. Nonetheless, a pro-U.S./pro-Japan tilt in India’s national security policy—a reaction to the power-projection capabilities of China—will be a defining characteristic of an increasingly globalized India. But both sides would seek to keep the competition as muted as possible for as long as possible.

In the long term, neither Indian nor Chinese defense planners can rule out the possibility of a renewed confrontation over Tibet, Kashmir, Myanmar, or in the Indian Ocean. A Sino-Indian rivalry in southern Asia and the northern Indian Ocean (especially the Malacca Straits) may well be a dominant feature of future Asian geopolitics of the twenty-first century, which could force their neighbors to choose sides. The nature of the rivalry will be determined by how domestic political and economic developments in these two countries affect their power, their outlooks, and their foreign and security policies.

While they are competitors for power and influence in Asia, China and India also share interests in maintaining regional stability (for example, combating the growing Islamic fundamentalist sector), exploiting economic opportunities, maintaining access to energy sources and markets, and enhancing regional cooperation. Cooperation could allow them to balance U.S. influence and increase their negotiating positions with the sole superpower. On economic, environmental, and cultural issues, they may have far more reason to cooperate than to collide. Intensifying tourism, trade, and commerce should eventually raise the stakes for China in its relationship with India. It is possible that economically prosperous and militarily confident China and India will come to terms with each other eventually as their mutual containment policies start yielding diminishing returns, but this is unlikely to happen for a few decades.

India-China Relations: The Way Forward

Excerpts from an article by Indian Ambassador to China, Nirupama Rao, that appeared in the January 2009 issue of the Beijing Review.

During the visit of the then Indian Prime Minister Shri Rajiv Gandhi to China in December 1988, at which I was a delegate and witness to history in the making, our young leader’s celebrated “long handshake” with China’s leader, Deng Xiaoping, generated great excitement and anticipation as the two countries emerged out of their brief estrangement and looked boldly to the 21st century . . . The visit remains a defining point in India-China relations . . .

Today, there is an overarching consensus across India’s political spectrum that an efficiently transacted, stable, durable and well-balanced relationship with China is vital to India. It is heartening to see similar sentiments expressed by the top leaders in China, who have defined ties with India as a strategic policy of their country. Our leaders today are meeting with increasing frequency, as befits the two great nations. Our two governments have decided to characterize our engagement in the changed geopolitical and geo-economic scenario as a Strategic and Cooperative Partnership for Peace and Prosperity. This means that we should not only take a strategic and long-term view of our bilateral ties in their multiple dimensions, but should constantly bear in mind our converging worldview of global, international and regional issues and events and thus give full play to our role as the two largest developing nations.

Thus our relations hold great promise, and beckon to us to rise to the challenges before us in a rapidly evolving world situation. As long as we keep the long-term and strategic nature of our partnership in mind, we will be able to calmly approach seemingly difficult and intractable issues in the interest of the long-term objectives of peace and friendship, which, as Premier Wen Jiabao has famously observed, have been the mainstream of India-China civilization ties for 99.99 percent of the time. While the scope for competition and cooperation exists side by side, the choice, of whether to make competition or cooperation the dominant theme of India-China discourse, is ours . . .

The indigenous peoples of Taiwan are the island’s original Austronesian inhabitants. They are a diverse collection of ethnic groups who have preserved and transformed their cultures over 400 years of invasion and rule by Chinese and Japanese rulers. Today they are important symbols of a multicultural Taiwan whose distinct political identities are institutionalized in law and state policies.

Taiwan’s 480,000 indigenous people—the island’s non-Chinese original inhabitants—make up 2 percent of Taiwan’s population. Archaeological evidence indicates that their ancestors migrated from the Asian mainland at least six thousand years ago and became the source of migrations south into insular Southeast Asia and the Pacific. Later migration northward from the Philippines brought some groups back to southern Taiwan. The twenty-two indigenous cultures and languages in Taiwan—fourteen of which still exist—are a major resource for research into Austronesian origins. Their languages include the oldest languages of the Austronesian family.

Original Inhabitants

The indigenous peoples of Taiwan were the island’s only inhabitants until 1625, when the Dutch founded a colony, and Chinese migration began. Almost all the plains aborigines (Pingpu 葡族) had been sinicized and had intermarried into Chinese settler society by the early twentieth century. Although a Pingpu ethnic revival is under way today, the real descendants of these people are the Hokkien-speaking Taiwanese, most of whom have Pingpu as well as Chinese ancestors. The fourteen state-recognized groups who inhabit the eastern coast and mountains survived because of their location’s geography and in part because other people feared them as headhunters and “savages.” Indigenous people were known as “Mountain People” (Shandiren 土地人, Shanbao 山胞) until the Return Our Name movement resulted in official adoption of the phrase Taiwan Aboriginal Peoples (Yuánzhuminzu 原住民族) in 1994. Since then the term indigenous has generally replaced the term aboriginal as the preferred translation of the Chinese term.

Relationships between the mountain aborigines and settler society were determined by trade and a Chinese defensive line along the mountain fringe until the 1860s, when export demand for camphor and tea led settlers to expand into the mountains, especially in northern Taiwan. Resistance by indigenous people and reprisals by settlers characterized a generation of sporadic warfare in the north. Such warfare ended only after 1895 with imposition of a strong defense line by Taiwan’s new Japanese rulers, who separated mountain indigenous areas from the rest of Taiwan and prohibited Chinese settlement and any non-Japanese cultural influence. This strategy of colonial control ultimately helped preserve indigenous territory and culture. The Tayal tribe most strongly resisted the imposition of harsh Japanese police administration.
A military campaign of five years (1910–1914) cost thousands of lives before the Tayal were conquered. In 1930 a final uprising, the Wushe Incident, occurred in central Taiwan. The Japanese rulers relocated villages from the deep mountains, introduced a cash economy and rice agriculture, and educated a generation of indigenous elite while eradicating much of the traditional indigenous social structure. Today indigenous culture is deeply marked by Japanese language and custom.

Importance of Churches

The Republic of China (Taiwan, 1949–) under the Chinese Nationalists continued most Japanese policies after 1945 but opened up the mountains to Christian evangelism and Chinese settlement. Policies of agricultural development, suppression of indigenous languages, enforcement of Mandarin Chinese education, and politicized sinicization in the 1950s were intended to assimilate the indigenous people. Attempts to oppose these policies by some members of the indigenous elite were quickly crushed, notably in 1954 with the execution of several leaders of the Formosan National Salvation Alliance. Most local leaders joined the Chinese Nationalist Party (Guomindang 國民黨 [GMD], Kuomintang) in order to win elections in the thirty Mountain Townships 山地鄉, which were low-level units of self-government that serve as conduits for patronage. Much of the indigenous reserve land, which had been held in trust by the state since days of Japanese rule for indigenous users, fell into Chinese hands. Indigenous society became plagued by alcoholism, poverty, suicide, and family breakdown. Indigenous people became sources of cheap labor in construction, factories, mines, and fishing. Today these problems continue in spite of significant improvements in the situation of indigenous people.

Churches became the basis of indigenous ethnic revival and cultural persistence. Through Catholic and Presbyterian evangelism about 70 percent of indigenous people had become Christian by 1960. Today in Taiwan Christianity is often considered to be a mark of indigenous identity. Use of indigenous language in worship, leadership by indigenous clergy, and inclusion of traditional forms of social cooperation in church organization affirmed and perpetuated indigenous identity, especially among Presbyterians. Churches were the only autonomous indigenous people’s organizations that were beyond state control.

A charismatic movement revitalized the indigenous Presbyterian churches from the mid-1970s on, and human rights concepts combined with biblical images of the Promised Land and the Chosen People, bringing elements of indigenous nationalism to everyday religious practice. Politically, most indigenous politicians continued to be loyal members of the Guomindang. However, widespread opposition to authoritarian GMD rule began to increase in the early 1980s. A few educated young people began to challenge GMD control of the indigenous people. In 1984, with support from the Presbyterian church, they founded the Alliance of Taiwan Aborigines 原住民權益促進會 (ATA). Indigenous churches were already conducting a campaign to gain land rights from the state and, with the ATA, began to be openly critical of state policies.
In 1987 several highly publicized local demonstrations were staged over land issues, with Presbyterian clergy played leading roles. The next year these demonstrations coalesced into the Return Our Land movement 還我土地運動 and an indigenous mass demonstration in the capital, Taipei, on 25 August 1988.

**Indigenous Rights Movements**

The Return Our Land movement gained the return of only about 13,000 hectares of land. However, it raised the profile of indigenous issues in Taiwan. Indigenous politicians sought to win elections by fighting for long-denied rights. Self-government 自治 and native language 母語 became popular social causes in the 1990s. The following resolutions were enshrined in constitutional revisions adopted in July 1997:

> The State affirms cultural pluralism and shall actively preserve and foster the development of indigenous languages and cultures.

> The State shall, in accordance with the will of the ethnic groups, safeguard the status and political participation of the aborigines. The State shall also guarantee and provide assistance and encouragement for indigenous education, culture, medical care, economic activity, land and social welfare. Measures for this shall be established by law. (Additional Articles 1997, Article 10)

In 1996 the cabinet-level Council of Indigenous Affairs was established, although it has no administrative authority. Nevertheless, the large roles in funding and policy consultation it has been given have contributed to an indigenous renaissance and to the development of many local and national nongovernmental initiatives. By 2000 indigenous peoples had become the symbol of the new multicultural Taiwan, present at every major public event and in overseas cultural exchanges. The then new president Chen Shuibian in 2000 appointed a leader of the indigenous rights movement, a Presbyterian minister, to head the Council of Indigenous Affairs 原住民族委員會 and made classes in native languages part of the school curriculum. Ambitious proposals to create indigenous autonomous areas were made but, because of GMD control of the legislature and aboriginal townships, were never executed. The Indigenous Peoples Basic Law 原住民基本法, passed in 2007, mandates this indigenous control of resources and culture. If the new GMD regime (2008) implements this law, the indigenous peoples of Taiwan could become a political model for the world in their transition from the ethnic margins to the political center.

Indochina-China Relations

Yindùzhīnà hé Zhōngguó de wàijìào guānxì
印 度 支 那 和 中 国 的 外 交 关 系

China’s relations with the three countries of Indochina—Cambodia, Laos, and Vietnam—have been marked by periods of collaboration interrupted by periods of tension and conflict. The relationship between China and Vietnam stands out as both the longest and the most multifaceted.

For more than a thousand years before Vietnam gained independence in the tenth century CE, it was a part of the Chinese empire. The independent Vietnam, however, remained under Chinese cultural and political influence in a tributary relationship (a prevalent feature of China’s dealings with foreign countries until the late nineteenth century, in which rituals of submission and offerings of money or goods were made to China with the assumption that those living within China’s ever-changing borders, as well as outside them, were in some sense Chinese subjects). But relations between China and Vietnam were not always harmonious, and in times of internal strife in Vietnam Chinese emperors interfered militarily in order to gain direct control, as the Ming dynasty (1368–1644) emperor did from 1407 to 1428, or in order to assist a threatened or deposed monarch, as in the case of the last emperor of the Vietnamese Late Le dynasty (1428–1788) in 1788. On both occasions the Vietnamese eventually defeated the Chinese. Another period of militarized conflicts occurred in the late thirteenth century when the Mongols ruled China and tried to expand political control into Vietnam. Eventually Vietnam won a decisive battle in 1288.

Vietnam also served as a safe haven for people fleeing political upheavals in China. One wave of immigrants came in the thirteenth century after the fall of the Song dynasty (960–1279). Another wave came in connection with the demise of the Ming dynasty during the seventeenth century when the Manchus ousted this dynasty.

The Chinese empire and the Khmer empire also had extensive contacts, as shown by the dispatch of Chinese diplomatic missions and also by trade relations. In fact, one of the most detailed accounts of life in the Khmer empire is the study of the customs of the Khmers by the Chinese diplomat Zhou Daguan.

During the period of French colonial rule over Indochina—gradually established during the second half of the nineteenth century—Chinese migration increased, and authorities in China became increasingly active in attempts to influence French policies toward the Chinese migrants. During the War with France (French, or First, Indochina War, 1946–1954) the support provided by the People’s Republic of China (PRC) after its victory in the civil war in China in 1949 was of crucial importance to the armed struggle of the Vietminh in the war against the French. Eventually the war ended in 1954 with the decisive victory of the Vietminh at the Battle of Dien Bien Phu and with the Geneva Conference held shortly thereafter. China’s role at that conference was important, and the outcome agreed upon was a compromise, with Vietnam being divided into two parts and with the armed resistance in Laos regrouping into two provinces of the
country. Because Cambodia had already been granted independence in 1953 it was not part of the agreement reached in Geneva.

Relations between 1954 and 1975

Relations between China and the Democratic Republic of Vietnam (DRV) were close in these years. China provided the DRV with extensive economic and military assistance and sent thousands of advisors to assist in various fields. China also provided the DRV with considerable assistance during the Vietnam War against the Republic of Vietnam and the United States in the 1960s and the first half of the 1970s. However, conflicts developed because of different perceptions of the Soviet Union and divergent views on relations and negotiations with the United States. After the Paris agreement in 1973 Vietnam claimed that China had advised it to diminish the level of the fighting in the south for a few years; the advice was perceived to be aimed at keeping Vietnam divided. China rejected this claim.

China's relations with Cambodia were also good but not as good as with the DRV. After the overthrow of Prince Norodom Sihanouk in 1970 China became one of the main sources of support for Sihanouk in his alliance with the Communist forces in Cambodia in the conflict against the Khmer Republic and its main ally, the United States.

In Laos China's support logically followed its stand toward the DRV, and thus China's support also extended to the Pathet Lao in the conflict against the government backed by the United States.

Relations between 1975 and 1991

In 1975 China's allies emerged victorious in both Cambodia and Vietnam, and in Laos China's ally assumed full control of power. Experts expected the new governments to continue their close collaboration with China. However, relations between China and Vietnam began to deteriorate over China's uneasiness about Vietnam's relations with the Soviet Union and China's increasing support for Cambodia in the conflict between Vietnam and Cambodia. The Vietnamese military intervention in Cambodia in late December 1978 caused further tension. There were also territorial disputes along the land border, in the Gulf of Tonkin, and in the South China Sea. The clashes that occurred along the border had more significance as an indication of deteriorating relations and of divergence on other issues than as conflicts in their own right. Finally, there was the issue of how the ethnic Chinese in Vietnam were treated by Vietnamese authorities. The mass migration of ethnic Chinese from Vietnam to China in the spring of 1978 led to the open and public deterioration of bilateral relations between the two countries. Vietnam's intervention in Cambodia in December 1978 eventually led to China's attack on Vietnam in February and March 1979.

The deterioration of relations between China and Vietnam also affected relations between China and Laos. Laos, as an ally of Vietnam and the Soviet Union, sided with Vietnam in the conflict with China, and consequently relations between Laos and China deteriorated in the late 1970s and into the 1980s.

Relations between Cambodia and China displayed a diametrically different development as compared to Sino-Vietnamese relations, that is, progressing from a good relationship to an alliance, with China emerging as the main supporter of the Cambodian government in its deepening conflict with Vietnam. China sought to mediate between Cambodia and Vietnam from 1975 to 1977. Initially, Chinese reporting on the conflict in early 1978 was fairly neutral, but China's pro-Cambodian stand gradually became more apparent. The Chinese decision to support Cambodia was taken after a visit by Le Duan, secretary-general of the Communist Party of Vietnam (CPV), to China in November 1977, but it was not implemented until 1978. As China's relations with Vietnam deteriorated in 1978 Chinese support to Cambodia increased. The Vietnamese military intervention that overthrew the Cambodian government was a major blow to China because a friendly government had been toppled, and China had not been in a position to prevent it.

China opted for a dual response to the Vietnamese presence in Cambodia. The first was a military response, which after the Chinese attack in February and March
1979 was characterized by continued military pressure and increased pressure in connection with Vietnamese military offensives in Cambodia. The other response was support for the Cambodian groups combating Vietnam and full diplomatic support for the policy of criticizing and isolating Vietnam—spearheaded by the Association of Southeast Nations (ASEAN).

The normalization process began with low-level contacts in the mid-1980s and expanded to high-level meetings from early 1989. In early September 1990 a secret Vietnamese high-level visit to China took place. Despite this meeting, political normalization did not gain momentum until mid-1991. Increased diplomatic interaction paved the way for a high-level summit from 5 to 10 November 1991, during which bilateral relations were officially fully normalized.

The relations between China and Laos were also normalized in the late 1980s in a process that was less complicated than the one between China and Vietnam, given that the deterioration in relations with Laos had
Relations in the 1990s and 2000s

The relationship between China and Vietnam has been characterized by two contradictory trends: one is positive, with expanding contacts and cooperation in many fields; the other is negative with continued differences relating primarily to territorial disputes. The positive trend has been prevalent since full normalization has at times been slowed by the fluctuating levels of tension relating to the territorial disputes, in particular those in the South China Sea area.

The expanding political, cultural, economic, and military contacts between the two countries illustrate the positive trend in improving and expanding bilateral relations. On a regular basis official delegations of one country visit the other country to discuss ways of expanding cooperation in various fields. A strong political willingness exists to strengthen the overall relationship between the two countries. The two countries have signed a number of bilateral agreements. Economic relations have expanded, and bilateral trade has grown considerably. China is also providing loans and assistance to upgrade Chinese-built factories in northern Vietnam. In the political field the relationship between the two ruling parties, that is, the Chinese Communist Party and the CPV, has been expanded through a regular exchange of visits at various levels within the two parties. The contacts between the armed forces of the two countries have also expanded through regular visits.

Tension in bilateral relations has primarily been caused by sharp differences relating to territorial disputes—that is, overlapping claims to the Paracel and Spratly archipelagos, to water and continental shelf areas in the South China Sea and in the Gulf of Tonkin, and to areas along the land border—that occurred on several occasions in the 1990s. However, efforts to resolve territorial disputes led to the signing of the Land Border Treaty on 30 December 1999 and to the Agreement on the Demarcation of Waters, Exclusive Economic Zones and Continental Shelves in the Gulf of Tonkin on 25 December 2000. In the 2000s tension relating to the disputes in the South China Sea has been reduced.

China’s relationship with Cambodia has been growing steadily since the early 1990s. China participated in the United Nations’ peacekeeping operation in Cambodia in 1993. The shift away from support of the Party of Democratic Kampuchea (Khmer Rouge) to support of the elected government in Cambodia and the traditionally good relations between King Norodom Sihanouk and Chinese leaders facilitated the political collaboration in the 1990s, and the trend has continued into the 2000s. Economic links also have been established and expanded. To maintain good relations with China is of considerable importance to Cambodia, given its complex and at times sour relations with Thailand and Vietnam, respectively.

Relations between China and Laos have expanded during the 1990s and 2000s. In October 1991 the two countries signed a treaty relating to their land boundary. The relationship has been characterized by both expanding economic ties and by closer political collaboration at both party and government levels. Its relationship with China has provided Laos with the opportunity to diversify its foreign policy and its dependence on Thailand economically and on Vietnam politically.

The Future

The history of relations between China and Indochina has been dominated by the relationship between China and Vietnam; periods of collaboration have been interrupted by periods of conflict and war. This pattern characterized the second half of the twentieth century. Currently a period of cooperation prevails after the improvement of relations during the 1990s and the expansion of relations in the 2000s. Relations between China and Laos have mainly been linked by the patterns of relations between China and Vietnam, in particular since 1975. The impact of the Sino-Vietnamese relationship on China’s relations with Cambodia has also been evident since 1975, in particular up to the resolution of the Cambodian conflict in 1991.

The future of the relationship between China and Vietnam will be determined by how the two sides handle disputes. Expanding bilateral cooperation and economic interaction contributes to building a more stable
bilateral relationship, and progress in managing territorial disputes has contributed to the prospect of long-term stability in the bilateral relationship. However, the disputes in the South China Sea remain a serious challenge. China’s activities along the Mekong River also could lead to disputes with Vietnam and also with Cambodia. Otherwise, relations between China and Cambodia can be expected to strengthen. The same can be said about relations between China and Laos.

因噎废食

Yin yē fèi shí
China is rapidly becoming an industrialized country. Since 1980 its gross domestic product has grown at an average rate of 10 percent annually, the highest in the world. China now ranks among world leaders in the output of steel, cement, coal, chemical fertilizers, and electronics.

China’s first attempts at modern industrialization occurred during the nineteenth century when the Qing dynasty (1644–1912) military leaders, who urged China to borrow technology from the West, initiated the Self-Strengthening Movement. The slogan voiced by one of the proponents of the movement, Feng Guifen (Feng Kuei-fen) (1809–1874), was “Learn the superior techniques of the barbarians in order to control the barbarians” (Mason 1997, 410). In light of the strong military influence, from 1861 until 1872 the emphasis was on manufacturing weapons. Later (1872–1894) the emphasis shifted from weapons to a broader range of products and from close central government control to control by regional authorities. The most conspicuous enterprises during that period were the China Merchants’ Steam Navigation Company and the Kaiping coal mines.

In time, because of bureaucratic inefficiencies, internal embezzlement, and corruption, most of the enterprises became economically unsuccessful. Scholars have argued that traditional society and traditional system of values contributed to the slow and uneven pace of industrialization from the end of the nineteenth century until 1916.

Wrapped up in political turmoil, civil war (1927–1950), the Japanese invasion and the subsequent War of Resistance against Japan (1937–1945), China was able to resume industrialization process only in 1953 with its first Five-Year Plan (1953–1957). During that plan the government prioritized rapid industrial development at the expense of agriculture. The privileged sectors included the iron and steel industries, electric power, coal, heavy engineering, construction materials, and chemicals. China’s Five-Year Plan followed the example of the Soviet model of industrialization with the goal of building a large-scale heavy industry production base. Chinese Communist Party (CCP) leader Mao Zedong, like Soviet leader Joseph Stalin, used agriculture as a resource for the development of industries. The Soviet Union helped China build plants with Soviet technical and financial assistance. In fact, prior to 1956, when the first truck was built by Changchun’s First Auto Works (FAW) in collaboration with the Soviet Union, China had almost no automotive manufacturing.

The next major campaign to industrialize was undertaken by the Chinese Communists between 1958 and early 1960 during the Great Leap Forward. The goal was to mobilize the population to solve China’s industrial and agricultural problems. Because of China’s vast labor resources, the labor-intensive method of industrialization rather than reliance on heavy machinery was chosen. Because the Great Leap Forward emphasized small-scale manufacturing, its most absurd manifestation was an imposition of small backyard steel furnaces in every village rather than construction of large steel plants. The Great Leap Forward was inherently deficient because of the
prevalence of ideology over expertise, errors in implementa-
tion, and economic inefficiency of the commune-based
small-scale production. As a result China’s agricultural
sector was seriously damaged, and about 20 million peo-
ple died of starvation between 1958 and 1962.

China’s modern industrialization is usually associ-
ated with the economic boom that began in 1978 with
Chinese Communist Party General Chairman Deng Xi-
aoping’s reforms. The Four Modernizations program was
announced in 1978 to facilitate progress and reform in the
fields of agriculture, industry, science and technology, and
national defense. China also introduced an open-door
policy and invited foreign direct investment (FDI).

**Focus on Agriculture**

The first period of the reforms (1978–1984) focused
on agriculture. One of the features of the agricultural
transformation was the household responsibility system,
which gave families permission to launch family coopera-
tives. The immediate focus on agricultural reform was
pragmatic: to provide food for 1 billion-plus people. The
success of the household responsibility system in the ag-
ricultural sector made two substantive contributions to
reform in the manufacturing sector. First, the agricul-
tural reform prompted farmers to be more productive.
Surplus farmers migrated to the manufacturing sector
and satisfied the labor demand. In 1980, 68.7 percent of
employment was in the agricultural sector, declining to
46.9 percent in 2000. Second, farmers’ increased income
boosted demand in manufactured products and allowed
them to indulge in consumerism.

The second period (1984–1992) was characterized by
the dismantlement of the Soviet-style centralized eco-

© 2009 by Berkshire Publishing Group LLC
continued market-oriented reforms and intensive industrialization.

Since the early 1990s China has allowed foreign investors to manufacture and sell a wide range of goods in the domestic market and has authorized the establishment of wholly foreign-owned enterprises in some industries. China is now one of the world’s leading recipients of FDI. It received $60 billion in 2005. The inflow of FDI into China over the period of twenty-five years surpassed $623.8 billion in 2005. The first serious investments into the realization of the Four Modernizations were made by the Chinese in Hong Kong, Macao, Taiwan, and by ethnic Chinese from Singapore, Southeastern Asia, and the West. Following the Chinese, the West started to invest in China. Western investors are attracted by the huge Chinese market, cheap labor, flexible environmental regulations, closeness to raw materials, and low construction costs. The establishment of special economic zones (SEZs) created a valuable instrument of investment allocation. The zones represent favorable investment climate regimes that provide various incentives to foreign investors, including tax exemptions and developed infrastructure. SEZs rely on centrally conceived legislation and are administered by local authorities. SEZ is an umbrella term that emerged from the original four SEZs located in Guangdong Province (Shenzhen, Zhuhai, and Shantou) and Fujian Province (Xiamen). Currently forty-nine national-status zones are divided into several categories: national economic and technological development zones (ETDZ), national free trade zones (FTZ), national high-tech industrial development zones (HIDZ), national Taiwanese investment zones (TIZ), national border and economic cooperation zones (BECZ), national export processing zones (EPZ), and national tourist and holiday resorts (THR).

**Coal Deposits**

Because of the investment regimes created in special economic zones, the eastern and southeastern coastal areas of China account for about 60 percent of the national manufacturing output. However, many industries are situated in the interior of China, especially coal mining. China’s most important mineral resources are hydrocarbons, of which coal is the most abundant. Most coal deposits are located in the northern part of the country.

In March 1992 Deng Xiaoping announced that China should not be constrained by ideological and political arguments about which label the reforms should carry—socialism or capitalism—implying that the economic transition is not about the label but rather about the process. The famous saying, “It does not matter whether the cat is black or white as long as it catches mice,” is attributed to Deng Xiaoping and alludes to the new mixed system of economic organization that combined market and socialist elements. Another slogan of economic reforms in China, “To get rich is glorious,” encouraged entrepreneurship. The economic reforms are slow and gradual when compared with the Russian quick transformation of the 1990s that combined both pro-market economic reforms and pro-democracy political reforms.

Since 1980 the average annual rate of growth of China’s gross domestic product (GDP) has been 10 percent, the
highest in the world. This period of accelerated growth in an industrializing country such as China is referred to as “catching up.” China’s industrial transformation was largely inspired by the experiences of the East Asian latecomer countries. Today China has the world’s fourth-largest economy in terms of GDP after the United States, Japan, and Germany.

Because of a trade surplus (China exports more than it imports), in 2006 China’s holdings of foreign-currency reserves, the yields of fast-growing exports, reached $1 trillion. Exports reached $762.3 billion in 2005. Major exports are electronics, machinery, apparel, furniture, and optical, photographic, and medical equipment. The main partners are the United States, Hong Kong, Japan, European Union, South Korea, and Singapore.

China’s industrial revolution over the past twenty-five years has allowed it to emerge as a leading industrial economy. At present China is referred to as the “world manufacturing base.” The manufacturing sector accounted for 52 percent of China’s GDP in 2003. As early as 1999 China ranked among world leaders in the output of steel, cement, coal, chemical fertilizers, and television sets.

Most heavy industries and products considered to be of national strategic interest remain state owned, but an increasing number of lighter and consumer-oriented manufacturing firms are private or are private-state joint ventures. At the beginning of the reforms China’s industrial policy focused more on marketization of the socialist economic system than on privatization of state-owned enterprises. The policy is changing now as more and more sectors are opening up to private investment.

Steel Industry

Among industries the metallurgical and machine-building industries have received high priority and account for about two-fifths of the total gross value of industrial output. China is a major player in the global steel market with regard to consumption and production. China’s steel consumption constituted 32 percent of the world’s total in 2005, and annual crude steel production surpassed the combined output of Japan, United States, Korea, and Russia. Chemical and petrochemical industries also receive state attention. The growth of the chemical industry has placed China among the world’s leading producers of nitrogenous fertilizers.

The pace of industrialization quickened and diversified in the 1990s. China developed automobile, aircraft, and aerospace manufacturing. In addition, China expanded rapidly into the production of electronics, semiconductors, software, and precision equipment, often in cooperation with foreign firms. The consumer electronics sector has been especially successful.

Industrial plants like this one in Beijing find a ready pool of skilled workers and a market for the goods they produce. PHOTO BY JOAN LEBOLD COHEN.
The automotive sector is one of the pillar industries in China. At present China occupies third place after the United States and Japan among the fifteen largest motor vehicle-producing countries. According to the recent Five-Year Plan (2001–2005), the goal for the auto industry was the production of 1 million cars a year. In 2002, the automobile industry in China was reported to consist of thousands of vehicle manufacturers and auto parts makers, employing nearly 2 million workers. A prominent trait of the Chinese automotive sector since the industrial transformation in the 1980s is heavy reliance on borrowed technology. Until the end of the 1990s nearly all cars manufactured in China were produced by joint ventures. As the end of the twenty-first century approaches, every large world automaker has a presence in China. With China having the potential to become the world’s largest car market—China’s January 2009 auto sales surpassed those of the United States for the first time—no major car manufacturer can afford not to be operating in China. The presence of foreign automakers is usually an indicator of a developed network of local suppliers—component parts manufacturers. Foreign automakers form joint ventures with Chinese state-owned companies to produce cars for the domestic market and for export. The industry is dynamically developing: China’s auto exports hit a record of 340,000 units in 2006, more than double the figure for 2005; in 2007 the number of vehicles and chassis reached 612,700.

One of the keys of China’s industrial revolution is state support of science and technology (S&T) and applied research. Between 1994 and 1998 nationwide research and development (R&D) funding as a percentage of GDP was 0.6–0.7 percent. This indicator increased sharply to 0.83 percent in 1999 and 1.01 percent in 2000. Whereas most developed countries’ R&D percentages range between 2 and 2.5, China stands out as a heavy spender among developing countries. Mexico’s R&D spending, for example, ranged from 0.31 percent in 1994 to 0.4 percent in 1999,
and India’s ranged from 0.81 percent to 0.86 percent in the same period. China’s government reported investing more than 57.6 billion RMB ($6.9 billion) in S&T in 2000, an increase of 4.8 percent over the previous year. The general directive of the S&T system is to enhance research implementation—the system encourages research institutes to launch commercial spin-offs based on successful applied research in their laboratories, especially in the high-tech sector.

**Abundant Labor Force**

One of China’s major resources is its abundant labor force. China’s population base of 1.33 billion people will continue to provide a labor supply at a relatively low wage rate for a long time. Consequently, the wage rate will go up, as it historically has in all mature industrialized economies.

Transportation is a key to an industrialization effort. Railway construction began in China at the end of the nineteenth century. Because railways can carry a large volume of goods over long distances, they are of special importance in China’s transportation system. Coal has long been the principal railway cargo. The increase in the production of petroleum and natural gas has made it necessary to build pipelines. Since the 1980s and especially since 1990 the emphasis had been on construction of highways. Thousands of miles of multilane express highways have been built in and around large cities to accommodate a vigorously increasing traffic. The road mileage has roughly doubled since the early 1980s. However, the increase in the motor vehicle fleet has grown more rapidly than road construction, especially in Beijing and Shanghai.

Since ancient times water transport has played a major role in moving goods. The Yangzi (Chang) River, the most important artery in China’s waterway network, accounts for almost half of the country’s waterway mileage. China has more than 125,000 kilometers of navigable inland waterways, the most extensive system of any country in the world.

In light of the impressive industrialization growth, China faces a number of challenges that can impede further development. One of the challenges is the resource and energy gap. China is generously endowed with raw materials, but, taking into account the accelerated development rate, these resources soon may be exhausted. At present China has reserves of 153 minerals, which positions China in third place in total global reserves. The country has abundant coal, oil, and natural gas deposits. However, the development of present resources does not keep up with the speed and growth of demand. Experts estimate that among the forty-five major minerals in China, only twenty-four will be able to meet demand in 2010, and only six will be able to meet demand in 2020. China will depend on the supply of gas and oil from abroad.

Another challenge is the deterioration of China’s environment as a side effect of intensive industrialization. In the absence of appropriate environmental protection policies, China’s human capital will be harmed. China faces a water shortage, which will have a dramatic impact on both industry and health care. Pollution, increasing desertification, and a growing population have put China’s annual per capita water availability at 2,200 tons, representing 25 percent of the world average. The volume of global air pollution will also increase as the billion-plus people in China begin to drive automobiles in massive numbers. If China’s number of motor vehicles per capita were comparable with the world average, its fleet would total 160 million, with 10 million new and replacement vehicles purchased each year.

**GDP Discrepancies**

Another development challenge facing China is the discrepancy in the contributions of the industries and services sectors to the GDP. Industry in China has surpassed the agriculture and services sectors in economic growth. Value-added shares of GDP in 2003 constituted 52 percent for industry, 33 percent for services, and only 15 percent for agriculture. No doubt China has emerged as a leading industrial economy. However, some argue that the fact that China’s growth in the manufacturing sector has failed to be matched by the growth in its services sector is an indication of underdevelopment. Industrial structure evolves from primary industry to the secondary and finally to the services sector. In many countries the manufacturing sector’s share within a country’s overall economy goes up at an early stage of economic development but declines when the country’s economic level approaches that of advanced countries. For example, the
Manufacturing sector's share of GDP in advanced countries, including Japan and the United States, has fallen to about 20 percent in recent years. This decline shows that deindustrialization is occurring in most advanced countries in the world.

In 2002 Xu Kuangdi, president of the Chinese Academy of Engineering (CAE), declared that China would need about twenty years to become an industrialized country and another thirty or forty years to become a modernized country. China is now on the path to those two goals. Many analysts are calling for sustainable industrialization of China, which involves balanced economic and social development, better regional integration, and more attention to the environment.

Inner Mongolia Autonomous Region, or Nei Monggol, is one of five such regions in China with a large percentage of ethnic minorities, and the first to be established (in 1947), predating the founding of the People’s Republic of China in 1949. It is slightly smaller than South Africa in area and is dominated by vast grasslands.

Bordering on the Mongolian People’s Republic and Russia to the north, Inner Mongolia Autonomous Region, or Nei Monggol, is China’s northern frontier. It was the first Autonomous Region (a region with a large percentage of ethnic minorities) to be established, in 1947, predating the People’s Republic of China by two years. It is an oblong strip of land, extending from northeast to southwest, with an area of 1.2 million square kilometers (463,423 square miles). Internally, it borders on Gansu, Ningxia, Shaanxi, Shanxi, Liaoning, Jilin, and Heilongjiang provinces. It is home to the Mongolian, Han, Hui, Manchu, Daur, and Ewenki peoples.

Inner Mongolia, with a temperate continental monsoon climate, has cold, long winters with frequent blizzards and warm, short summers. With its vast stretches of grasslands, it is a major stockbreeding center known for its Sanhe horses, Sanhe oxen, and fine wool sheep. Daxinganling Forest, in Inner Mongolia’s northeast sector, makes up one-sixth of China’s total forest reserve. Apart from wheat, naked oats, millet, sorghum, maize, and rice, a wide range of cash crops is grown, including soybeans, linseed, rapeseed (canola), castor oil plants, and sugar beets. Inner Mongolia holds first place in the country in rare earth metals and niobium and natural soda reserves and second place in coal reserves.

Huhehaote (Hohhot), the capital of Inner Mongolia, is an ancient city located north of the Great Wall. Baotou, another major city in the region, is one of China’s major iron- and steel-producing centers.

Many changes are afoot in the largely pastoral region as traditional ways of life such as herding are encroached
upon by the rapid modernization of China in recent years.

The Chinese have a long history of freely borrowing ideas from other countries, which, in the past, has caused no problems. But in today’s global marketplace, ideas, or intellectual property, have become a commodity. Borrowing intellectual property has become infringement, a violation of ownership rights. China is one of the world’s worst offenders of intellectual property infringement.

Visitors to China can easily buy pirated CDs and DVDs on the streets of most major cities. Representatives from U.S. companies find imitations of their products in the factories and markets they visit in China. Editors of journals and books in the United States and Europe too often turn down written work from Chinese authors because of obvious plagiarism. These are examples of blatant infringement of intellectual property rights, a persistent problem in China.

Creative Content

Intellectual property broadly refers to creative content, including music, art, writing, and innovation, such as the research and development creations of business and corporate work. In general terms, intellectual property rights (IPR) are the exclusive rights of individuals or businesses to control the production and reproduction of their creative, intellectual property. This is often seen in the form of copyrights, patents, and trademarks, and frequently discussed in terms of music, films, printed texts (such as books and periodicals); software, and proprietary business developments. IPR infringement has become an increasingly visible issue as global markets for foreign products widen. As demand for access to a greater range of intellectual property grows, illicit reproduction of this creative content has become more commonplace. In economic, trade, and diplomatic circles, IPR protection has become a top agenda item for foreign countries and businesses entering China, one of the fastest growing consumer markets.

As a member of the World Trade Association (WTO), China is required to have in place an IPR protection and enforcement system that includes consistent enforcement, criminal and civil procedures to deal with IPR infringers, and equal protection, access, and treatment for holders of copyrights, trademarks, and patents, whether the copyright holders are foreign or Chinese. But protection of intellectual property rights has been somewhat lax in China.

Violations

In 2005 the International Intellectual Property Alliance (IIPA) reported that more than 86 percent of the business software in use in China, 92 percent of entertainment software, 85 percent of all music, 93 percent of all movies, and 52 percent of all books were pirated. In surveying the U.S. copyright-based industries (software, publishing, music, and film) that it represents, the IIPA discovered
that China was responsible for an estimated $2.6 billion in lost trade revenue in 2005.

Several high-profile companies have taken action against IPR infringement. One is Starbucks Corporation, which was successful in 2005 in getting two coffee shops to give up the name Xingbake, a Chinese phonetic approximation of Starbucks, with xing also meaning “star,” and to stop using a near duplicate of the famous green Starbucks logo.

Despite Starbucks success IPR infringement remains rampant in China, with everything from the most popular and noticeable brands to the most minute parts and components of everyday products being copied. The rapid rise of the Internet and the burgeoning numbers of Internet users has made piracy even easier and less costly for the infringer—though it should be added that this problem is not unique to China. U.S. interests would like to see China bring more cases of infringement of foreign-owned copyrights, patents, and trademarks to court. The IIPA noted that in 2005, of all the cases of IPR infringement prosecuted in China’s courts, only approximately 2 percent involved protecting foreign-owned intellectual property.

Enforcement

The United States uses three main methods to target IPR infringement: bilateral negotiations, the option (and sometimes threat) of a WTO dispute case, and a provision of the U.S. Trade Act of 1974 called Special 301.

BILATERAL NEGOTIATIONS

The United States and China have two major mechanisms for addressing bilateral trade issues in general, and these mechanisms have been moderately useful for discussing issues related to IPR. The first is the U.S.-China Joint Commission on Commerce and Trade (JCCT), established in 1983, and the second is the U.S.-China Strategic Economic Dialogue (SED), launched in 2005. The JCCT meets twice annually, once in Beijing and once in Washington, for discussions of market access, subsidies, IPR, and other trade issues. The SED has become a forum for high-level talks between officials, including cabinet-level officials from the United States and their equivalents among the Chinese leadership.

The JCCT

The United States uses JCCT talks to pressure Chinese leaders on the local level to crack down on IPR infringement in their jurisdictions. The JCCT has allowed China and the United States to discuss disagreements, solve trade-flow issues, and address pending regulations before they are implemented, thereby averting future problems. For example, officials from Washington and Beijing were able to reach an agreement on a proposed software law in China that would have limited foreign companies’ ability to get legitimate software into Chinese government offices. If the law had been enacted, not only would it have hurt foreign companies’ ability to do business in China but also would have undermined efforts to curb IPR infringement. Without easy access to legitimate software, government offices would most likely have turned to pirated software.
The SED
The SED talks have been used mainly as a catalyst to invigorate areas of bilateral negotiations by raising them to the senior levels of government. Because the SED involves senior-level officials, it can be used to increase the focus on getting results from other forums, such as the JCCT, and to make political commitments to support such things as IPR enforcement. In 2006 the SED talks allowed the United States and China to lay out commitments on IPR (for example, a province-by-province review of China’s IPR enforcement) that would be further discussed through the JCCT.

WTO Involvement
The United States has sought improvements in China’s IPR system primarily through bilateral dialogue instead of taking action through the WTO because bilateral dialogue generally produces faster results than a drawn-out WTO case does. Additionally, to date there has never been a WTO case against China on IPR, which means that bringing such a case involves navigating an uncharted area of WTO dispute settlement. Nevertheless, the U.S. industries most affected by IPR infringement have been outspoken in Washington about pushing for better IPR protection in China, and there has been a lot of talk about pursuing a WTO case against China on IPR.

In April 2005 the United States, Japan, and Switzerland did use Article 63.3 of the WTO Agreement on Trade-Related Aspects of Intellectual Property to request that China spell out the specific details of its IPR system. The biggest challenge in a WTO case is proving that China’s system is ineffective. As is the case with most countries, China is obligated to protect only trademarks, copyrights, and patents registered in China. It is not required to enforce the intellectual property laws of any other country or to protect patents, trademarks, or copyrights that are registered in other countries but not in China. To prove that China is failing to meet WTO-mandated IPR commitments, companies need to try to prosecute cases in
China’s courts. This means that they have to have registered their trademarks, patents, or copyrights in China. They then must file a suit there and see the suit through to some conclusion.

Because registering a copyright and then proving infringement is a tedious and oftentimes frustrating process, negotiators and trade officials feel that mounting and proving a WTO case could be difficult to do quickly, though U.S. officials have been amassing data and information so they will be prepared should they choose to pursue such a case. A WTO-dispute case would be difficult because the United States would have to show that U.S. companies went through the Chinese court system and that the system failed them in order to prove that China’s system does not provide the level of protection agreed to under the WTO. In the meantime, industry groups, including the IIPA, have asked their members to register their copyrights and to attempt to bring IPR cases to China’s courts so that the deficiencies of China’s systems will be evident when proof is needed.

**SPECIAL 301**

The United States also uses Special 301, an annual review process provided for in the Trade Act of 1974, to identify countries that are especially egregious violators of IPR rules and standards. China has long been listed on the Priority Watch List, a designation that dictates extra attention and bilateral dialogue aimed at improving IPR enforcement. U.S. officials use the Priority Watch List designations to increase the amount of resources devoted to targeting IPR protection in a country. Additionally, if a country is on the Priority Watch List, it is subject to special investigation. The United States also uses the Special 301 designations as a trigger for increasing its negotiations with countries that have failed to meet their IPR commitments. In 2008 China was listed on the Priority Watch List, along with Russia, Argentina, Chile, India, Israel, Pakistan, Thailand, and Venezuela.

**China’s Point of View**

China’s history, specifically its efforts to establish its independence from foreign influence, has in part been attributed to its notoriety as a place for IPR infringement. As China tried to move beyond foreign allegiances and strengthen its standing, copying intellectual material, mainly books, that would aid in such growth was seen as morally defensible. Without any overall negative sense being attributed to copyright infringement, there was little impetus to curb such infringement.

Further, China established efforts to solidify its individual standing in the world by limiting the amount of foreign content allowed inside the country (such as a quota on foreign films) and boosting its own intellectual production. And since China has started to take a larger place in the global market and its own intellectual property has become attractive, especially in cinema, Chinese producers have started to see their own products subject to illegal infringement. IPR advocates see this development as key to reversing the trend of illicit reproduction of creative content in China.

Many government and trade-group officials in the United States believe that IPR infringement can be further curtailed by increasing enforcement, shutting down major piracy operations, and getting pirated products off the streets. A more effective enforcement system is critical to China’s economic development and trade relations with the United States, a fact that the Chinese leadership is sure to be aware of.

**Further Reading**

The screening of content over the Internet by the government is common and far-reaching, overseen by thousands of private and public monitors who filter content sent through websites, blogs, forums, and e-mail. A majority of Chinese Internet users have said in surveys that they prefer that the Internet be controlled in some way.

The Chinese government’s control over the Internet, including Internet content, is well documented and hardly a surprise to anyone. All media in the country is tightly controlled, which, to most people in the West, amounts to unacceptable censorship. The actual scope of Internet content filtering is difficult to determine because the monitors continually shift their attention to certain sites and topics they deem undesirable.

Monitoring the Monitors

Reports of China’s Internet filtering comes from the activities of bloggers, academics, nongovernmental organizations, and watchdog groups both within and outside the country that monitor China’s filtering system and compare and discusses its characteristics on e-mail lists, blogs, and other public forums. One such watchdog is the OpenNet Initiative (ONI), a joint project that monitors and reports on Internet filtering and surveillance practices by governments. Partners in the project are the Citizen Lab at the Munk Centre for International Studies at the University of Toronto; the Berkman Center for Internet & Society at the Harvard Law School; the Oxford Internet Institute at the University of Oxford; and the Advanced Network Research Group at the University of Cambridge.

In a 2005 report, the ONI described China as operating “the most extensive, technologically sophisticated, and broad-reaching system of Internet filtering in the world.” China’s filtering program employs a combination of technical, legal, and social measures applied at a variety of access points and overseen by thousands of private and public monitors who filter content sent through a range of communication methods, such as websites, blogs, forums, and e-mail. Together, these measures create a matrix of soft and hard controls and induce a widespread climate of self-censorship.

Technical Mechanisms

Technical filtering mechanisms can be found at all levels of the Internet, from the basic architecture to PCs located in hotels and Internet cafés. Although Internet Service Providers (ISPs), Internet cafés, search engines, and other network services can and do operate their own filtering systems, all network traffic is subject to a uniform system of filtering at three major international gateways in Beijing, Shanghai, and Guangzhou known collectively as the Great China Firewall. Filtering is centralized and largely consistent across each of the international gateways.
This gateway level of filtering is an unavoidable last line of defense. ONI research has uncovered three forms of filtering at these international gateways: DNS tampering, keyword filtering, and IP blocking.

DNS tampering works by interfering with the system that cross-references domain names with the numerical address associated with them. Users are directed to an invalid IP as if the site they requested did not exist. By contrast, IP blocking targets the numerical address. This type of blocking can cause major collateral filtering of unrelated content because different domain names can share the same IP address host.

Keyword filtering targets the URL path—and, increasingy, the webpages—searching for banned terms. When one is found, the routers send what are known as RST packets, which terminate the connection between sending and receiving computers, effectively preventing that computer from making requests to the same server for an indefinite period. Because the system works both ways (for requests exiting and entering China), it can be tested by searching for banned keywords like “Falun Gong” or “Tibet” on search engines hosted in China. In each case users requesting banned information receive an error message on their web browser, making it appear as if the information is not available or that there is something wrong with their Internet connection. Users trying to access banned content do not receive a block page informing them that the content is officially filtered, as is the case in some other countries that censor the Internet.

During the Tibetan protests in 2008, another new, sophisticated form of blocking appeared: the use of distributed denial of service (DDOS) attacks. There have been persistent and increasing charges that DDOS attacks against servers in the United States, the United Kingdom, Canada, and elsewhere have their origins in mainland China. Such attacks were prominent during and following the demonstrations in Tibet, with the servers of many Tibetan and Chinese human rights organizations systematically targeted. It is difficult to pinpoint the source of these more aggressive methods of denying access to information, which effectively target and disable the sources of information themselves rather than passively blocking requests for information, as the filtering systems do.

Technical means of filtering are complemented by an extensive set of social and legal or regulatory measures. Legal or regulatory measures tend to be vague and broad; they offer a wide scope for application and enforcement as well as uncertainty among users. Most have the effect of holding end users and services—such as café operators, ISPs, blog-hosting services, and media—responsible for
censoring the content they post and host. Since enforce-
ment can be arbitrary, users and operators of services tend
to err on the side of caution, preferring to prevent or re-
move offending material rather than risk censure.

Social measures are even more general and thus harder
to define, but they include operating norms, principles,
and rules that are propagated through media and official
channels and are combined with extensive techniques of
surveillance, which together affect behavior in both for-
mal and informal ways. These include self-discipline pacts
signed by Chinese Internet service companies pledging
to uphold public values and self-censorship by Internet
users. The first thing many users see when logging on are
two cute cartoon police officer characters, Jingjing and
Chacha, that pop up and warn users not to visit banned
sites or post harmful information.

Content
Content targeted for blocking is wide ranging and covers
social, cultural, security, and political topics considered a
threat to Communist Party control and social or political
stability. Among the topics most frequently blocked are
Taiwanese and Tibetan independence, Falun Gong, the
Dalai Lama, the Tiananmen Square incident, and opposi-
tion political parties.

ONI investigations revealed that China’s filtering
tends to focus disproportionately on content in local Chi-
inese languages. Users searching for the equivalent Eng-
lish language terms, for example, will often get a higher
proportion of results than they would for the same terms
searched for in Chinese.

During the 2003 SARS epidemic, the government
tried to restrict news about the outbreaks in the early days
of the crisis while officials and experts tried to work out
a course of action. But groups inside and outside China
used the Internet, along with mobile phones and satellite
broadcasts, to ensure that information about the disease
was widely distributed.

In January 2009 the Internet Affairs Bureau under the
State Council Information Office launched a campaign
against online gaming sites that may be too violent or too
political. Websites and services that help people evade
government censorship are also regularly filtered.

Although the filtering system appears consistent and
relatively stable from day to day, the Chinese government
has also demonstrated a propensity to use what ONI calls
just-in-time blocking in response to special situations as
they emerge. For example, during the demonstrations
in Tibet in 2008, the government implemented blocks
against Youtube.com and other video-streaming services
that were circulating images of protests. The blocks were
later lifted.

Government Response

Official acknowledgement of censorship of Internet content
has been inconsistent. Officials deny or do not discuss de-
tails of content-filtering practices. On rare occasions when
public officials raise the subject, they compare it to similar
practices in the West and justify it as way to protect public
safety, core social values, and stability. When Google.cn
was established and agreed to abide by government rules,
there was an international outcry over censorship. But
searches on Google.cn on controversial topics brought up
many sites that were critical of the government. But the full
scope of China’s censorship regime is never spelled out in
official circles or public government documents.

Generally speaking, Chinese Internet users accept
government intervention much more readily than users
in Western countries would do. In surveys conducted in
2003, 2005, and 2007, more than 80 percent of respon-
dents in China said that the Internet should be controlled
and that the government should be the controlling agent,
a role that the government intends to maintain.

global Internet filtering. Cambridge, MA: MIT Press.
China’s burgeoning Internet industry is helping fuel the nation’s economy. Online gaming and social networking are the most popular uses of the Internet. Business-to-business selling and online shopping are growing rapidly. In just a few short years, and with limited penetration, the Internet has grown to become one of China’s major industries.

The Internet is one of China’s largest industries. The China Internet Economy Research Center (CNERC) divides the Internet industry into many sectors and subsectors. These include Internet enterprises, such as search engines and service portals; Internet business activities, such as advertising, recruiting, and business-to-business (B2B) and business-to-consumer (B2C) e-commerce; online economic activities such as banking, investing, travel booking, and shopping; online social networking, which includes text messaging, chat rooms, and the online community; and online recreation, such as gaming, watching videos, and downloading music.

History
The history of the development of China’s Internet industry can be divided into four phases: beginning, upswing, depression, and recovery.

First Phase, Beginning (1993-1995)
In 1993 the concept of an Internet economy was first introduced to China, initiating the construction of basic network facilities. In 1994 China officially connected to the Internet, and four main networks were established: ChinaNet, run by a state-owned telecommunication company, is the largest Internet service provider in China providing public Internet access. China Science and Technology Network, managed by the Chinese Academy of Science, is a network for the scientific and technology communities. China Education and Research Network (CERN) is mainly for academic use by students and researchers. And China Golden Bridge Network links government departments.

Second Phase, Upswing (1996-1999)
In May 1996 Yahoo, founded by Yang Zhiyuan (also known as Jerry Yang), was listed in NASDAQ for the first time. A rush to open websites took over China, among which the portal site Sohu became the most influential. In 1998, World Electronic Commerce Year, the Chinese Commodity Market officially joined the Internet. In that same year, the Chinese Ministry of Information Industry (MII) was established to regulate the entire information industry, from the manufacturing of electronic and IT products to developing national communication networks. Internet connections were installed under the

© 2009 by Berkshire Publishing Group LLC
directive of the MII to cover forty-three cities that constitute the Chinapac network for data transmission. The MII also connected one thousand universities under CERN to use the Internet.

In 1999 B2B e-commerce began, and the portal site Sina was launched, which ended the leading role of Sohu in China. Also at this time, different kinds of professional vertical websites were launched, and the competition among domestic websites became more intense. During these years the information industry became China’s first large-scale industry. China’s IT sector was growing at 25 percent per year.

China, like the rest of the world, suffered through the dot-com collapse at this time. A great number of websites closed before showing any profit.

FOURTH PHASE, RECOVERY (2003–PRESENT)

Since 2003, the Chinese Internet industry has recovered and has been growing stronger. Although the Internet industry started comparatively late in China, it developed rapidly. Since 2005, its market scale has grown by 40 percent or higher every year.

Recent Developments

Overall, the Internet industry continued to grow through 2008, although at a slower rate than in previous years. All sectors continued to develop, and online gaming and mobile value-added services became two of the main drivers in the evolution of the Internet industry.

In 2007 the market share of online gaming exceeded that of mobile value-added services for the first time, with 57 million users generating some 12.8 billion yuan ($1.8 billion) in sales. But after ten years of rapid development, online gaming entered a new phase in 2008. Social problems and legal issues caused by gaming have put this sector of the industry under close government scrutiny. At the same time, reorganization among providers, the licensing of third-generation (3G) technology, and the regulation of junk messaging have boosted mobile value-added services. In the coming years, this sector is expected to see more reshuffling as the government works to strengthen management practices and expand the market.

The top four earning enterprises of the Chinese Internet industry in 2008 were Tencent, China’s largest Internet services portal; Shanda, an online gaming company; Alibaba, a B2B marketplace portal; and Netease, a Web portal and gaming site.

According to CNERC, B2B e-commerce in China developed rapidly in 2008, despite the global economic crisis. Under the effect of the financial crisis, more small and medium-sized enterprises turned toward the domestic market, and online retailing started to become attractive to buyers.

Internet advertising spending grew from nothing in 1996 to 39.6 million yuan ($5.8 million) in 1998 and to 82 million yuan ($12 million) in 1999. It reached 5 billion yuan ($731 million) in 2006. The 2008 Beijing Olympics provided a superb opportunity for large-scale Internet marketing, and Internet advertising increased by 70 percent from the previous year. The long-term effects of the financial crisis that began in 2008 are yet to be seen, but Internet ad sales were expected to hit 12.2 billion yuan ($1.79 billion) by 2009, according to a 2006 Deutsche Bank report. The media service group ZenithOptimedia predicted in a 2007 report that online ad spending in China will surpass magazine ad spending by 2010.

Online Shopping

According to Taobao.com, China’s largest online auction site, online shopping accounted for just 0.64 percent of retail sales in China in 2008 but will likely make up 5 percent to 8 percent by 2012. The total amount spent online increased 125 percent in 2008, according to a survey by Shanghai-based research agency iResearch Inc. Online shopping in China was expanding sharply in early 2009 and expected to continue growing, bucking the worldwide trend in private saving over spending. The iResearch agency predicts Chinese e-shoppers could be spending 569 billion yuan ($83.1 billion) a year by 2012.
E-shopping is attractive to Chinese consumers because of the low prices of goods available online, the countless choices that appeal to younger fashion-conscious buyers, and the purchasing power of the yuan.

Foreign-made goods are in particular high demand with online shoppers, with products from Europe and East Asia leading the way. In 2008 purchases from the United States ranked fourth on Taobao.com by volume but first in amount spent per transaction. Transactions at Taobao.com’s global shopping channel have been rising at a three-digit rate each year since the channel launched in 2006.

Profiting from Taobao.com’s success, Alipay, an e-commerce payment-transfer provider, introduced a new service in 2007 that enabled overseas retailers to sell products directly to mainland consumers. Eighteen months after launching, Alipay had 250 partner retailers based in Hong Kong, East Asia, Japan, Europe, and the United States. Its membership had reached 120 million by the end of 2008. The service is sure to grow because Chinese online shoppers are trusting and prefer third-party payment transfers to paying by credit card online.

The most popular purchases through Alipay are cosmetics, brand name clothing, nutrition products, and electronic equipment and gadgets. Alipay’s biggest user group is made up of young, relatively affluent women. Often a number of these shrewd shoppers band together to place group orders, which results in reduced shipping costs.

The Internet shopping market potential is huge. In June 2008 China became the largest Internet country in the world when it surpassed the United States with 253 million users online. (By comparison the United States had 223 million active Internet users in June 2008.) By January 2009 there were 298 million Internet users in China, according to China Internet Network Information Center, a government-approved group that provides data on technical aspects of the Internet as well as demographic information.

**Limitations**

In spite of the rapid development of the Internet industry and Internet use, a number of factors persist to limit development of the industry and the proliferation of Internet technology.

Most Internet users in China live in urban areas. People in the countryside are isolated by the lack of communication. Estimates are that half have never even used a telephone. Farmers do not know the market prices for their crops and are swindled by business people who profit from their ignorance. In emergencies farmers have to walk, often long distances, to get help because they have no technology with which to connect to the outer world. Lack of access to communication restricts employment and education. The main cause of unequal access is cost. Most people in the poorer rural regions cannot afford Internet services or equipment.

Although there has been a notable expansion in the quantity of services and equipment, quality has remained
second-rate in many cases. China’s Internet infrastructure lags behind most other developed countries’ facilities; the bandwidth is narrow; the pace of accessing is slow; and the running standards of networks are poor. Development of the Internet industry has been unbalanced. Different sectors and different enterprises have developed at different rates. In addition, investment in Internet infrastructure construction and improvement has been low.

The level of innovation in information technology in China falls far behind that of other developed countries. The core technologies that make up of China’s basic information architecture—such as network facilities, computer chips, system software, and security products—are usually provided by foreign enterprises. Some major technology projects still depend heavily on the participation of foreign companies.

Although advancing, until recently B2B e-commerce had been unknown and underused. A suitable platform for effective B2B e-commerce is still being tested. Logistical problems, inefficient payment systems, and a lack of available credit have been bottlenecks in the expansion of e-commerce in particular and the Internet industry as a whole. But the government is now actively promoting a workable e-commerce platform, and awareness of this way of doing business is growing among Chinese business people.

Despite the limitations and problems, researchers at CNERC and others believe that the Internet industry will be grow steadily in the future, if not as dramatically as in the past. With easier access, higher quality products and services, supportive government policies, and the commitment of 300 million Chinese Internet users, it is reasonable to expect a bright future for the Internet industry.

Internet Use

Hùiliánwǎng shìyòng 互联网使用

China has surpassed the United States as the country with the largest number of Internet users in the world, although use of the Internet differs in the two countries. While the majority of U.S. users shop online, for instance, only about a fraction of Chinese do. Nevertheless, e-shopping in China surged dramatically in early 2009.

Internet use in China began with the sending of an e-mail from Beijing to Germany on 20 September 1987. Chinese and German scientists had jointly created an e-mail node. The subject line of the first e-mail was “Across the Great Wall we can reach every corner in the world.”

The Internet in China was used mainly by academics until early 1996 when Internet service provider (ISP) ChinaNet began to provide public Internet access. After that, Internet development and usage expanded quickly.

Subject for Study

Founded in June 1997, and administratively operated by the Chinese Academy of Sciences (CAS), the China Internet Network Information Center (CNNIC), which also takes responsibility of China’s top-level domain name registry under “.CN” country code, started to release Internet survey reports as early as October 1997. The reports are recognized as official data approved by the Chinese government. They cover Internet usage, such as location and time spent on the Internet, and users’ online activities, as well as demographic information.

A research project at the Chinese Academy of Social Sciences in Beijing, the China Internet Project (CNIP), has released Internet survey reports every two years since 2001. It covers the broad effects of the Internet and has become a key source for analyzing technical aspects of the Internet, comparative demographics, and research on Internet use. Its research focuses on urban China. Data on Internet usage in rural China is still sparse and anecdotal, though it is thought that a large number of mobile telephone users access the Internet via their phones. Other studies on Internet use in China can be found from CCID Consulting, International Data Group, and iResearch, among others.

Internet Development

Until 1999 there were only four gateways connecting China to the world. ChinaNet, run by a state-owned telecommunication company, is the largest ISP in China providing public Internet access. China Science and Technology Network (CSTNET), managed by the Chinese Academy of Science, is a network for the scientific and technology communities. China Education and Research Network (CERNET) is mainly for academic use by students and researchers. And China Golden Bridge Network (CHINAGBN), which no longer operates independently,
links government departments. Since 1999, a host of major portal websites has come online, including Sina.com, Sohu.com, and Netease.com. Other commercial websites, such as Baidu.com, a Chinese search engine, Taobao.com, a Chinese eBay-style C2C website, and Dangdang.com, a Chinese online bookstore, are becoming popular in China. Unlike in most other industries, only a few foreign Internet companies have been able to gain the kind of market share they hoped for when entering China. Homegrown Chinese companies dominate the field.

In 2005 fewer than 70 percent of Internet users were accessing information through search engines, about 60 percent were using e-mail, and only 20 percent were shopping. Since then, however there has been a well-recognized shift. More users are logging onto search engines and buying things online; e-mail and online marketing are becoming familiar; and bulletin board systems, social networking sites, blogs, and other web sources for use in both education and entertainment are becoming more important.

In 1997 the number of Internet users was 620,000; the number of computer hosts, 300,000; and the number of websites, 1,500. Since 2000, the volume of Chinese content on the Internet has exploded. By December 2007 the number of Chinese websites had reached an estimated 1.5 million; many overseas Chinese, especially college students and professors, contribute to the content of these sites. Chinese became the second Internet language after English. There are about 431 million English-language Internet users worldwide; the number of all Internet users worldwide is about 1.5 billion.

China became the largest Internet country in the world in 2008 when it surpassed the United States with 253 million users online. By January 2009 there were 298 million Internet users in China, about a 23 percent penetration (the average percentage of the population that regularly accesses the Internet), according to CNNIC. By comparison the United States had 223 million active Internet users in June 2008, about a 73 percent penetration. In developed countries the average penetration is 70 percent; overall penetration in the world is 21.1 percent. Most Internet users in China live in urban areas, where the Internet penetration rate is about 56 percent.

**Users and Uses**

Internet users in China are mainly concentrated in urban areas. They tend to be young, male, fairly well educated, and working in professional jobs. One study showed that 30.3 percent of Internet users are eighteen to twenty-four years old and that 18.7 percent are twenty-five to thirty years old, a total of 49 percent of users. This is a common profile for technology adopters in general. But, compared to the United States, where 73 percent of women and 73 percent of men use the Internet, development in China is still in an early stage.

In urban areas the Internet plays a major role in many people’s lives. Users read news; gather information about health care; download music and movies; play games; communicate with classmates, colleagues, or friends; and express opinions on current events, news, public affairs, and government policy.

Reading news online is popular among urban users. The Internet has become a convenient and inexpensive way to learn of domestic and international events. Chinese users are particularly eager to comment or enter into discussions online after reading the news. Yet traditional media—TV, newspapers, and radio—are still more trusted than online news is. In the 2007 CNIP report, 70 percent of respondents in China (compared to 52 percent in the United States, according to the survey conducted...
by USC Digital Center) said that a small portion or none of the information online is reliable.

Urban Internet users spend more time on entertainment, such as downloading music and movies or playing games, than on any other online activities. The 2007 CNIP survey found that in urban China, 37 percent of Internet users go online at least once a week to download or watch videos, the highest percentage of any country surveyed.

E-mail is used mainly among classmates or colleagues but is less popular than QQ, an instant message computer program, which is mostly used among friends. And text messaging has become very popular. Most people use pinyin, the English alphabet to write Chinese pronunciations, when texting. But the fastest way is to use the wubizixing input method, which uses Chinese characters. Some people use a text editor known as MULE (an abbreviation of multilingual enhancement) that can process many languages, including traditional and simplified Chinese.

Compared to the United States, where 71 percent of Internet users shop online, China has a low rate of e-shoppers. According to CNNIC, about 20 percent to 25 percent of Chinese Internet users buy things online, although the number of e-shoppers has rapidly increased, and is expected to rise even higher. While many online shoppers pay for goods with bank cards (mostly debit cards), others use systems similar to PayPal, such as Zhifubao. On the most popular online shopping website, Taobao.com, part of the business site Alibaba.com, Zhifubao is widely used. Some online bookstores and other retailers that sell small consumer items continue to use the traditional cash on delivery (COD) payment method. Orders are placed online but nothing is paid until the goods are delivered into the customer’s hands, whether at their home or workplace.

Chinese Domain Names

Chinese characters in URLs will soon be part of the international standard for the Internet. When a Chinese domain name (中国 domain name) is formally put into use, this domain name is upgraded into the Chinese Domain Name global root domain name registration database. The system requires that “中国” be a top-level domain name representing China on the global Internet. The Internet Corporation for Assigned Names and Numbers,
An internet forum in which Chinese students discuss taking the GRE (Graduate Record Examination) and TOEFL (Test of English as a Foreign Language). Together, students taking these two tests are called GT’ers.

Further Reading

During the pre-reform years of China’s planned economy, the Iron Rice Bowl was a range of social services guaranteed to workers. Services included lifetime employment, housing, health care, and pension plans.

Before China moved from a centrally planned economy to a market economy, the Iron Rice Bowl (tie fan wan) was an array of social services enjoyed by workers that could exceed in value even the workers’ nominal wage. These services included lifetime employment, housing, health care, pension plans, child care, education for workers’ children, ration coupons for commodities, and even subsidized food. The access to services was directly related to a worker’s employment in a work unit (danwei) or to a worker’s place of residence as indicated by his or her residence certificate (hukou).

The Iron Rice Bowl embodied the commitment of the Chinese Communist Party to China’s modernization and in particular to the belief that industrial workers employed in state-owned enterprises (SOEs) represent the vanguard of society. The privileges enjoyed by these workers were also granted, to various degrees, to civil servants, teachers, and army personnel. This regime became theoretically universal after Chinese Communist Party leader Mao Zedong sponsored the development of People’s Communes, rural farm collectives that were administered by a central authority (a Communist cadre) where everything was shared and even distributed. Class enemies were excluded, however, and for residents of impoverished regions access to social services was merely theoretical. In addition, the advantages that should accrue from the Iron Rice Bowl did not amount to much during the famine of the Great Leap Forward (1958–1960), Mao’s plan to turn China from a primarily agrarian economy dominated by peasant farmers into a modern, industrialized communist society, or the chaos of the Cultural Revolution (1966–1976).

Yet, because workers made decisions in their councils on the benefits they should enjoy—often regardless of the economic performance of their employer—the Iron Rice Bowl represented an ideal to which everyone aspired. The policies undertaken by Chinese Communist Party leader Deng Xiaoping after 1978 undermined these benefits in the name of economic growth. After the household responsibility system replaced the People’s Communes during the 1980s, peasants gradually lost many of their entitlements and suffered a deterioration of living and employment conditions after the 1990s as doctors, teachers, and other providers of social services charged increasingly expensive fees for their services. Because a worker’s free access to social services was limited to services from his or her place of residence, migrant workers who moved to cities looking for work were often deprived of services if they could not afford them.

Many rural residents who were too old or too frail to work the land and whose children were gone were not entitled to pension benefits because they could theoretically draw revenue from what they produced. Many urban
workers employed in the private sector did not receive any of the benefits enjoyed by SOE employees or civil servants. Even the privileged category of SOE workers suffered a deterioration of its situation as many firms were constrained by their managers to close and therefore left their former employees without a living. The aging of the Chinese population aggravated the situation: Chinese demographers expect that in the next decade the ratio of employed people to unemployed people will decline and place a major burden on those who hold jobs. Former premier Zhu Rongji (in office 1998–2003) pushed for a reform of SOEs, and his successor, Wen Jiabao, has replaced the Iron Rice Bowl with a more universal system of social security.

Islam

Yìsilánjiào 伊斯兰教

Although “Seek learning even onto China,” the oft-cited hadith—a narrative record of the sayings or customs of the Prophet Muhammad and his companions—has been over-interpreted in commentaries and by pure speculation, it does suggest the farthest limits of Muslim expansion. From the Tang years (618–907 CE) to the present—considering the basic demand of Islam that its followers ought to live under Muslim regimes—difficult problems have arisen for Muslim minorities living in non-Muslim lands.

In the twenty-first century Chinese Islam (or Islam in China, as some would have it) has over 25 million adherents divided almost evenly between the Hui (the ethnically sinified Muslims of mainland China) and the Turks (mainly Uygurs but also tiny Kazakh, Kyrgyz, and other minorities) in the Chinese northwest and Tibet. This population constitutes the core of Muslim presence in eastern Asia. The other countries of eastern Asia—Japan and Korea—have been home to Muslim minorities only in recent decades, and most of them are not native or converted Muslims but rather members of foreign Muslim communities of diplomats and traders who have settled or, more often, have been posted provisionally there. For those who count Taiwan as a separate entity, one may also take notice of the small (a few tens of thousands) but thriving Muslim community that derives from mainland China and emigrated to the island in 1949, together with the withdrawing forces and populations accompanying Chiang Kai-shek and his retinue into exile.

Today, due to unrest of the Uyghurs of Xinjiang Uyghur Autonomous Region, aided by their exiled kin in the West or in the adjoining former Soviet Muslim republics of central Asia, Islam in those far-flung regions of the world has taken center stage in China, not only when viewed for its own sake and the challenge it poses to the jealously unified Chinese state but also when viewed in the context of the Muslim fundamentalist wave that has been rocking much of Asia. Indeed, the familiarity in China of the terms jihad (a holy war waged on behalf of Islam as a religious duty) and Hezbollah (Party of God)—and occasional acts of terror that have been resorted to in northwest China of late—conjure Muslim unrest in Asia and elsewhere that cannot be glossed over: the Middle Eastern violence; the militant Islamist Osama bin Laden's activities in southern and central Asia; the Abu Sayyaf “exploits” in the Philippines; or the rampages of some Muslim radical groups in the Malay world of Southeast Asia.

In view of the basic demand of Islam that its followers ought to live under Muslim regimes, difficult problems are posed by the very idea of any Muslim minority living in non-Muslim lands, which is certainly the case with China (unlike the Muslims of southern, southeastern, and central Asia who constitute majorities in their respective countries). This applies not only to majority-minority and host culture–guest culture relationships but also to some basic requirements, short of which a Muslim
minority may rebel against the ruling government and even try to secede from it. This issue, which has recurred in the history of many Muslim minorities throughout the world, not least of which were the bloody secessionist rebellions in nineteenth-century China, acquires more acuity in China these days due to the extraordinary convergence of several major factors:

- Chinese society and culture, which have a long tradition of assimilating foreign cultures, had to contend in this case with a self-confident guest culture, with a vast hinterland of Islam outside the confines of China, which hardly lends itself to acculturation.
- Chinese Communism, which has been until recently strictly antireligious, has been opening up of late, thus creating a more accommodating environment for religious, if not yet political, pluralism.
- The growing interest of the Islamic core in the minorities of the periphery, partly due to the current revival of Islam, has raised the feasibility of Islamic renewal in the remote fringes of the Islamic world.

Mosque, Shanghai, 1980. PHOTO BY JOAN LEBOLD COHEN.
The proximity to Chinese territory of the newly independent former Soviet Muslim republics, some of whose kin (e.g., Kazakhs and Kyrgyz) live in China, has made the latter permeable to ethnic-nationalist influences from the outside.

The Coming of Islam to East Asia

The formative years of Islam in China—or east Asia, for that matter—occurred during the era between the Tang dynasty (618–907 CE) and the Yuan-Mongol rulers (1279–1368), when Muslim merchants and artisans and later administrators and mercenaries made their way there. It is generally held that while the numbers of Muslims in China were small and initially confined to the coastal cities of the southeast, notably Quanzhou during the Tang and the Song dynasty (960–1279), by the fall of the Song dynasty there were probably four or even six mosques in China. This indicates that the population, although small and almost exclusively foreign, had sufficient continuity and common wealth to sustain a mosque, burial grounds, and other features of an ongoing Muslim settlement. It must, however, remain conjectural as to whether this population would have assimilated or emigrated over the centuries to rejoin the Muslim landmass had it not been for the dramatic growth of China’s immigrant Muslim population under the Yuan-Mongol rule.

Unlike the first wave of immigrant Muslims via ocean-faring routes, known as the “Maritime Silk Road,” the second wave under the Yuan followed the ancient land-bound Silk Roads, now reconnecting China to the west by the continuity of Mongol rule. Then an unprecedented period of exchange unfolded between the Chinese and Islamic cultural worlds, which for the first and only time in history were part of the same political entity. Voluntary and enforced migrations from the Islamic lands into China meant that by the restoration of indigenous Chinese rule under the Ming dynasty (1368–1644), sizable Muslim communities were established right across the country. It is thus mainly from the latter immigrants that most Hui Muslims now descend, although many of them claim more ancient roots. This was also the period when mass conversions of the Uyghurs to Islam took place.

Expansion of Islam

Under the conditions of tolerance—some would say indifference—of the great khans (medieval sovereigns of China and rulers over the Turkish, Tatar, and Mongol tribes), the Muslim community made great strides, and the evidence of such great Muslim travelers as Ibn Battuta shows that there were also flourishing mercantile colonies in the coastal cities along the China Sea. Muslims became prominent in occupations such as engineering, medicine, technology, transportation and overseas trade, agriculture, and handicraft work. Under the Yuan there was also a significant change in religious life; mosques and schools were built; and a network of Muslim hostels was established for traveling Muslim merchants. In the end of the Mongol rule Muslims may have totaled some
4 million souls, more than any other minority in China. They took their place in all aspects of Chinese life: political, economic, administrative, and military; yet, they were still confined to their own communities, somewhat isolated, partly by their customs and dietary laws, from the vast Chinese population surrounding them.

The high profile of the Muslims during the Yuan dynasty inevitably provoked a backlash. Many Muslim officials and commanders behaved arrogantly and oppressively, lording it over the native Chinese majority, which had itself cultivated the much more ancient Confucian ethos and traditions that were at variance with some Muslim attitudes. Hence, the situation changed under the indigenous Ming, for whom the Golden Age of the Yuan was now over. At the beginning Muslims could still practice their social and religious freedoms, but later the regime forced many Chinese to settle in the border zones where the Muslims had established their communities. Through intermarriage and prohibitions to the practice of their religious laws, many of them assimilated materially and adopted Chinese dress, speech, and other customs, a process that turned them from Muslims in China to Chinese Muslims.

Ming times also saw the appearance of a series of Muslim charismatic leaders who founded new, generally Sufi (Muslim mystic) movements within the Muslim communities after returning from periods spent in Muslim lands to the west. There is evidence of Sufi presence in China since Yuan or even Song times, which provided a fertile ground for the Naqshbandi missionaries who arrived in fifteenth-century China. The arrival of the Naqshbandi and Qadari Islamic mystics gave new forms of expression to Chinese Muslims who had been muzzled by the oppressive atmosphere of the regime. These expressions were crystallized into the quintessentially Chinese-Muslim invention of the *menhuan*, groups that clustered around charismatic mystics, whose leadership often became hereditary. These *menhuan* often subdivided into bitterly rivaling clusters, the most famous and widespread of who are the Khufya and Jahriyya branches of the Naqshbandiya, themselves subdivided into dozens of groups that lend to Chinese Islam its extreme sectarian variety. Other non-Sufi denominations include the whole range from fundamentalist puritans to reform-minded progressives.

**Into the Modern Era and Beyond**

The last Chinese dynasty, the Qing (1644–1912), perhaps because it was itself Manchu and therefore wary of other “alien” cultures, inaugurated an era of violence in the relationship between the Middle Kingdom and its minorities.
The general chaos and devolution of power in the nineteenth century triggered large-scale Muslim rebellions throughout the northwest and the southwest of the country, where three separate attempts were made at secession by Du Wenxiu in Yunnan, Ma Hualong in Gansu, and Yakub Bek in Kashgar. At least two of those rebellions (Yunnan and Gansu) were related to the dynamics of Sufi sectarianism, associated with the eighteenth-century scholar and revivalist Ma Mingxin. His group was known as the “Xinjiao” (the New Teaching), apparently one of the many appellations of the Jahri brand of Sufism, and it turned to armed unrest no less to battle its other Sufi rivals than to counter the ruling dynasty. However, all those attempts were sunk in blood, leaving millions of Muslims and Chinese dead and vast swaths of country devastated.

Under the Republic of China (1912–1949) and then under Communist rule (since 1949), the Muslims have
been recognized as a “national minority,” but under the People’s Republic of China they are kept atomized under their various ethnic groupings (Uyghur, Kazakh, Hui, etc.) to facilitate the ancient divide et impera (Latin: divide and conquer) device of control. Generally speaking, because of the regime’s necessity to maintain relations with Muslim countries on the international arena, it strove to avoid any brutal mass oppression of the Muslims domestically. However, during the excesses of the Great Leap Forward in the 1950s and the Cultural Revolution (1966–1976), Muslims were greatly mistreated and abused, waqf lands (endowed land in Islamic tradition) were confiscated, mosques destroyed, and Muslims forced to undergo Marxist indoctrination. On several occasions attacks were launched by Chinese troops against Muslim villages. However, since Communist Party leader Deng Xiaoping came into power in 1979 and initiated the opening and reform of China to the outside world, the government has relented on pursuing the policies that once suppressed Muslims across the country.

In the post-Deng era (since the mid-1990s), the Chinese leadership, which has been struggling to maintain its balancing act between openness and economic development on the one hand and stringent control on the reins of power on the other hand, has also had to face the challenge of Uygur separatism over the past decade. Deng’s policy of relaxation had been calculated to make any social unrest unwarranted. However, following Deng’s own saying in another context that “when the window is open it also allows mosquitoes in,” his moderate policy also opened the door to widespread violence in practically all the counties of Xinjiang, the northwest, and the far west of China. Admittedly, some of the violence was directly triggered by printed insults against the Muslims, but it escalated and got out of hand with the military intervention of the People’s Liberation Army, as in Xining in the autumn of 1993. In some areas, as in Kashgar, bombing was perpetrated (October 1993), and the ominous war cries of jihad, associated with a local Hezbollah, were voiced.

Prospects
The rampages of the Taliban in neighboring Afghanistan and the unrest in east Turkestan are watched by other Asian countries not only for their own threatening sake but also for their radiating influence onto their territories. The active support of radical Muslim groups and countries has turned the Chinese parts of East Asia, just like neighboring central Asia, into one of the centers of Islamic radical violence today. Most of the Hui-Muslim minority is spread over practically all of mainland China and therefore lacks a specific territory it can claim as its own and use as a base—hence its avoidance of clamoring for secession—while Qinghai and Xinjiang provinces, which are closer to the Muslim world and have been drawing support from some of it, have advanced secession demands, and violence has been resorted to in pursuance of this goal. Thus, due to both the lax policy of the Chinese government, which permits links and visits between its Muslims and the outside world, and the pressing interests of the radical elements in the Islamic world, one can expect more outbursts of this sort. Such outbursts may culminate in outright demands for secession from China. In view of the unified concept of government in China, which has never acknowledged the existence of “federated republics” in its midst (unlike the Soviet Union) nor tolerated secession (consider Tibet as an example), it is hard to conceive a China that would sit idly by while its borders are permeated by rebellion and chaos.

Closely associated with China for more than 7,000 years, jade has been personified with moral attributes and used for religious, ceremonial, and decorative purposes throughout history.

Jade (yu), a hard, luminous stone available in various colors (including white, yellow, green, gray, mauve, and brown), has been an artistic medium in China from at least the fifth millennium BCE. The term “jade” is generally given to two types of stones: nephrite, a crystalline calcium magnesium silicate from northeastern China (Jiangsu Province) and Central Asia’s Khotan and Yarkand regions; and jadeite, a green, glassy sodium aluminum silicate mineral of the pyroxene family from Myanmar (Burma). It is nephrite, however, that early Chinese artists used to create ritual objects, personal items, and ornaments.

Valued originally for its innate beauty, jade came to be conceptualized as having moral virtues and magical properties; mythology claimed it was the congealed semen of a celestial dragon. The Han dynasty scholar Xu Shen

Workroom in the jade factory at the Yangzhou Commune. Jade sculptures and ornaments were made in factories like this one and exported or sold to tourists. Propaganda posters line the walls of this particular factory. PHOTO BY JOAN LEBOLD COHEN.
(c. 58–147 CE) characterized jade as having five virtues: wisdom, as typified by its purity and penetrating sound when struck; courage, in that while it can be broken, it cannot be bent; integrity, as signified by its translucence; charity, epitomized by its bright warm luster; and equity, represented by its sharp angles that injure none.

Special techniques for carving jade were necessary because of jade’s exceptional density. Unlike most other stones, which can be chiseled, jade must be carved through an arduous abrasion process utilizing drills and quartz sand. This labor-intensive process makes jade artifacts very costly. From earliest times, jade was the ultimate symbol of wealth and power, and thus, the finest workmanship and artistry were lavished on the precious stone.

The earliest artistic use of jade occurred in the Hongshan culture of the middle Huang (Yellow) River basin, Liaoning Province, from the fifth to fourth millennia BCE. Examples of jade carvings in this period include coiled dragons, owls, turtles, and cloudlike plaques. Jade carvings are so predominant among Hongshan artifacts that some scholars have referred to this period as the Jade Age.

Ritual use of jade in burials continued in China throughout the Han dynasty (206 BCE–24 CE). Jade objects were positioned on, around, and under the bodies of the deceased in their tombs. Thus jade was regarded as having more than social status; it had ritual and protective properties as well. The most extraordinary examples were found near Lingshan, in Hebei Province: In the tomb of Prince Liu Sheng and his wife Princess Dou Wan, the two royal figures were covered from head to foot in outfits made entirely of jade plaques drilled at the four corners and fastened with gold wire. It is believed that these functioned as shrouds, protecting the body from decomposition and from attack by evil forces.

Jade implements were important in conducting affairs of state during the Shang (1766–1045 BCE) and Zhou (1045–256 BCE) dynasties, in that various pieces came to signify specific courtly ranks. Because jade was identified with the imperial court and with great virtue, it became likened to the Confucian ideal of the perfect gentleman (junzi).

Beginning in the Warring States period (475–221 BCE), jade was used increasingly for secular items and personal adornment. By the Tang dynasty (618–907 CE), the secular use of jade was widespread. Jewelry, fine vessels, and utensils, as well as objets d’art that had no particular religious connotation, were crafted from jade. Decorative and functional items such as bowls, cups, dishes, jugs, vases, containers, hair ornaments, beads, and bracelets received lavish, delicate ornamentation.

After centuries, the art and tradition of working with jade spread westward from China through Central Asia into India and Turkey. There are fine examples of carved jade from the Mughal Empire (1526–1857), known as Hindustan jades. Many of these are embellished with intricate designs that incorporate precious gems held in place with gold filigree.
Jade Working in Ancient China

In his work Science and Civilisation in China, scholar Joseph Needham discusses the appeal and importance of working with jade and other semi-precious stones.

The Chinese had begun fashioning objects of jade at least by about –5000 [BCE]. By the end of the Neolithic period, jade had clearly established its primacy among the semi-precious stones suitable for “carving” and it would continue to grow in importance in the succeeding centuries...

Because of the rarity of jade deposits in the Chinese heartland, jade played no significant direct role in the history of Chinese mining. It was important, indirectly, however, in two ways: (1) its combination of prestige and rarity led Chinese to search widely for other stones that most resembled jade, and (2) the Chinese love of “carved” jade, which is not carved at all since jade, either nephrite or jadeite, is too hard to be cut even by steel tools alone, led the Chinese to search for the most effective abrasives that could be used for shaping it.

Neolithic stone carvers used many other minerals and stones along with jade to make ornaments. A very early example comes from the Ho-mu-tu culture south of Hang-chou Bay where fluorite was used along with jade to make ornaments. At another site, near Nanking, jade and agate were used together.

After thousands of years, jade remains so closely identified with Chinese culture that the medals presented during Beijing’s 2008 Summer Olympics were inlaid with a ring of jade.

Japan-China Relations

Riběn hé Zhōngguó de wàijiāo guānānxì
日本和中国的外交关系

Relations between China and Japan extend back to ancient times, with frequent cultural borrowings travelling in both directions across the Sea of Japan and the East China Sea. Scholars divide writings about Japan from pre-Ming years (pre-1368) up to the present into eight phases, within which are four periods described as “high tides,” often brought on by war, when the volume of literature swelled.

Ancient China is better understood today than ever before, thanks to archaeological finds of the past fifty years. Ancient maritime China, however, is less well understood, although studies underway are yielding insights into the early relations centered around the geographic triangle of northeastern China, Korea, and Japan. Recent writings discuss patterns of trade and migration, the distribution of artifacts and their meaning, the spread of peoples, goods, and ideas, funerary practices across the region, and early state formation.

A long written record precedes and complements the archaeological finds. The earliest Chinese account of Japan appears in the classic Shanhai jing (Classic of Mountains and Waters). A work of lively imagination, Shanhai jing refers to Japan metaphorically as “Fusang” (intertwining mulberry tree, like two lovers embracing each other). China’s unifier, Shi Huangdi of the Qin dynasty (221–206 BCE), was so captivated by the magical “Eastern Seas” that he dispatched Xu Fu (255 BCE–?) in 219 BCE and again in 210 to search for elixirs of immortality, sending with him a reported three thousand virgin boys and girls and sailors and craftsmen in the thousands. In Japan to this day shrines and monuments to Xu Fu abound. A native of the state of Qi in modern Shandong Province, Xu Fu was born not far from Penglai, itself shrouded in legend. Chinese and Japanese scholars pursue studies of Xu Fu and this maritime region with vigor.

A less mythological and more objective early Chinese account of Japan is the data on Woren (Japanese) in the Chinese dynastic history, San’guo zhi (Treatises of the Three Kingdoms [289 CE]), by Chen Shou (223–297 CE). From this account forward most zhengshi (Chinese official histories) include an entry on Japan. (See table 1.) Beginning with the Jiu Tang shu (Old Tang History) of 945 CE, Chinese refer to Japan by its own preferred name of “Riben” (in Japanese, Nihon or Nippon) which translated as “Land of the Rising Sun,” that is, land to the east where the sun rises. For the next one thousand years all Chinese standard histories used Riben as the primary term for Japan. This practice shows a Chinese knowledge of and formal respect for Japan that was significant. However, many entries on Japan before the Ming dynasty (1368–1644) include materials that are sinocentric and contain data that are unscientific and thus must be used with care.

These official histories and other Chinese writings reflect the ups and downs of China-Japan relations to the present. The eight phases of writing and interactions include four “high tides” (gaochao). The four high tides are the Ming dynasty, the late Qing dynasty (1895–1912), the
period of the War of Resistance against Japan (1931–1945), and from 1979 to the present. (See table 2.)

Phase 1, the long period before 1368 and the Ming dynasty, covered writings of more than a thousand years. In this period of loose if steady Chinese awareness of Japan, Japan for its part underwent episodes of transformative borrowings from China after 600 CE, well known to students of Japanese history.

Phase 2 was the Ming dynasty itself. The Ming faced enormous pressures from the outside world, summarized in the phrase “bei Lu nan Wo” or “Lu [nomad enemies] to the north, and Wo [Japanese pirates] to the south.” During much of the Ming dynasty Japanese pirates or Wokou (in Japanese, wakō) devastated coastal east Asia from Korea down China’s long eastern shore on into Southeast Asia. This piracy created a rift within China, pitting hawks—those wanting to ban ocean travel—against doves, those favoring state protection for China’s lucrative maritime trade. China’s Wokou problem spurred an unprecedented need for knowledge about Japan among Chinese. This need resulted in the first “high tide” of Chinese writings on Japan. Ming studies of Japan are distinguished from previous writings by several features: their range of authorship (by officials but also by nonofficials); by the nature of their writings, not just brief notes in official histories but also comprehensive monographic works; and by the variety of specialized new topics—among them Japanese terminology of Chinese origin, Japanese systems of governance, famous people, household utensils, Japanese “gods and ghosts” (guishen), and information from Japanese primary sources collected in Japan itself. Among the most important writers and works of this first high tide are: Xue Jun (flourished 1523–1530); Riben kaolue (Brief Reference Materials on Japan); Zheng Shun’gong (sixteenth century); Riben yijian (An Account of Japan), based partly on six months in 1556 collecting data in Japan itself; and Zheng Ruozeng (1503–1570), Chouhai tubian (Atlas for Coastal Defense) (1562), a groundbreaking work in eight parts including chapters relating to Japanese pirate raids and Chinese defense against them.

Phase 3 occurred during the Qing dynasty (1644–1912) up to Japan’s Meiji Restoration of 1868. Here Chinese writings virtually vanished as a result of Japanese

government policies. Well before 1644 the Tokugawa shogunate or bakufu (1600/1603–1868) for internal security reasons had sealed Japan’s borders and forbidden its people from leaving Japan on penalty of death. By this unilateral action Japanese authorities solved China’s “wakō problem.” As for non-Japanese coming to Japan, the Tokugawa created a system of regulated foreign contact at the one port of Nagasaki, with access limited to the Dutch, Chinese, and Koreans. China’s new Manchu conquerors after 1644, free of Japanese pirates, were able to pacify China’s coast and in 1683 bring Taiwan under direct Chinese administration. Taiwan emerged as an object of Chinese curiosity and of rich firsthand reports, motivated by trade and security interests. Because writers lacked similar access to Japan, Chinese writings on Japan floundered. Writings on Nagasaki by Chinese focused narrowly on trade issues, while the more comprehensive study by Weng Guangping, *Wuqi jing bu* (Supplement to the *Azuma kagami* [History of Japan]) (1814), remained unpublished and little known. In short, Qing writings are undistinguished when compared with writings of the Ming dynasty or with Chinese writings after 1877.

The last 140 years, from the Meiji period in Japan (1868–1912) to the present, have been a period of accelerated writings that reflects interactions both constructive and destructive. Phase 4, 1868–1894, a period of just twenty-six years, ushered in Phase 5, 1895–1912, a high tide of seventeen years. From the latter part of Phase 4, in 1877 when China established its first modern diplomatic mission in Japan, Chinese recorded impressions of a rapidly modernizing Japan in the form of diaries, collected poems, and high-quality reference materials. Chinese diplomat Huang Zunxian launched this era with his collected poems, *Riben zashi shi* (Poems on Japan Topics) (1879), themselves a springboard to his magnificent *Ribenguo zhi* (Treatises on Japan) (1890/1895). Other notable works were Wang Tao’s *Fusang youji* (A Record of Travels in Japan) (1879), the breakthrough mini-encyclopedia of diplomat Chen Jialin, *Dong cha wenjian lu* (Records of Things Heard and Seen in Japan) (1887), and the ambitious compilation by China travel mission reporter Fu Yunlong, *Youli Riben tujing* (Japan, with Maps and Tables) (1889). Behind many of these reports hovered the injunction of Qing dynasty statesman Li Hongzhang “to investigate other people’s

activities in hopes of both connecting with and containing them, so as to minimize future troubles” (quoted in Wang Baoping 2001–2003, 2). These authors, unlike earlier writers of the Qing period, based their knowledge on firsthand data, observation, and experience.

In the aftermath of the Sino-Japanese War of 1894–1895 and China’s humiliating military defeat, Chinese study missions “rushed to Japan like clouds chased by the winds” (Wang Baoping 2001–2003, 4). Phase 5, 1895–1912, included China’s second great wave or high tide of Chinese writings about Japan. For the previous fifteen hundred years Japan had essentially borrowed from China. Now, in a great reversal, China borrowed deliberately and profusely from Japan. Kang Youwei, the noted reformer, declared in 1897 in an audience with China’s Guangxu emperor, “The Japanese did in thirty years what took the west three hundred years. China with its great size and large population should be able to do it in three” (quoted in Wang Xiaoqiu 1992, 2000, 321). Thanks to Meiji Japan as a model and helpmate, what followed from 1898 to 1912 was revolutionary for China, with intellectual and institutional transformations under the label of xinzheng, or modernization, that brought China into the twentieth century.

Phase 6, the nearly forty years from 1912 to 1949, had three subphases. Subphase 1, 1912–1930, included growing Chinese disillusionment with Japan after the Russo-Japanese War of 1904–1905 but especially after Japan’s Twenty-One Demands of 1915. Unlike in Phase 5, Chinese writings of this period were dominated by translations rather than original reporting, with 665 titles published between 1912 and 1931, averaging thirty-two titles per year. Subphase 2, 1931–1945, featured accelerating Japanese aggression against China, highlighted by Japan’s occupation of northeast China (Manchuria) in 1931 and its steady thrust into north China. These actions culminated in Japan’s “total war” with China after 1937, including the infamous “Rape of Nanking” of December 1937 and other atrocities. Chinese, driven to understand this recent helpmate-turned-relentless enemy, produced a third high tide of writings on Japan that featured journals (nearly thirty titles in the 1930s and 1940s alone) and multivolume collectanea (collected writings, congshu). Fresh inquiries addressed the complex issues of “Japanism” (Riben zhuyi), Shinto and Japanese imperialism, and militarism and fascism in Japan. One-time Japanophile and Chinese military strategist Zhang Baili (1882–1938)—the
Japanese Military Academy (Shikan Gakkô) top graduate in the class of 1904—wrote a probing article, "The Japanese: One Foreigner's Analysis" (Ribenren: Yige waiguo ren de yanjiu) (1938), that was guarded toward Japan. Like Zhang Baili, his superior, Generalissimo Chiang Kai-shek—trained also at Shikan Gakkô and a sometime Japanophile—was not allowed the option of a mutually beneficial relationship because of Japan's brutal aggression. Both Zhang and Chiang—and a host of others, including Guo Moruo (1892–1978), who, like Zhang Baili, was married to a Japanese woman—are symbolic of the failure of military aggression as a policy in contrast to the cooperation of the second high tide period of 1895–1912. The third subphase, 1945–1948, included a number of writings on postwar Japan, but China's civil war prevented any systematic advance of Japanese studies in China.

The period after 1949, under the People's Republic of China, constituted Phases 7 and 8. Phase 7, 1949–1978, passed through two subphases. In the period from 1949 to 1966 some writers from subphases 6 (2) and 6 (3) published new works and remained active, but more typically the studies of this period were government driven and focused on politics, particularly Japan's cozy relationship with the United States. A few Chinese university-based Japan Studies Centers came into being, and research activities began to pick up just when the Cultural Revolution (1966–1976) erupted and brought most academic endeavors to a standstill.

Subphase 7 (2), 1966–1978, included two further subperiods: 7 (2) (1) (1966–1972) and 7 (2) (2) (1972–1978). During the height of the Cultural Revolution Japanese studies and writings basically came to a halt. Then, in 1972 Japan and China restored diplomatic relations, and the People's Republic of China resumed its membership in the United Nations, replacing the Republic of China (Taiwan) as the legitimate representative of China. Immediately the study of the Japanese language took off in a kind of "craze" (rechao), with dozens of Chinese universities establishing Japanese language departments or centers, more than one hundred institutions of higher learning offering Japanese as a second language, and major Chinese cities broadcasting Japanese-language study programs and correspondence courses. All this, along with the reopening of former Japan Studies Centers, laid the foundation for the next high tide of Chinese writings on Japan.

Phase 8, the current high tide, follows the 1978 call by the Chinese Communist Party and central government for "emancipation of the mind" (jiefang sixiang) and "opening and reform" (gaige kaifang). The field of Japanese studies has grown spectacularly. Serial publications on Japan have soared, numbering nearly sixty titles just since 1979. These serials have played a vital role in nurturing the more mature scholarship of the present.

Most distinctive today are the numerous academic exchanges and joint projects between Chinese and Japanese academicians, often independent of Chinese government direction. Scholars from Japan travel to China by invitation, and Chinese scholars travel to Japan to study (and increasingly remain to teach), give guest lectures, participate in academic conferences, and conduct research and investigations. These exchanges, in the words of Li Yu, are "most direct, most effective, and most conducive of deeper understandings" (Li Yu 2001, 22). In depth, scope, and sophistication, current researches and exchange are unparalleled in Chinese history.

Although marked by these many positive exchanges, relations today are far from untroubled. On the positive side, besides the academic exchanges one can point to the large and mutually beneficial trade relationship that has led China to surpass the United States as Japan's number one trading partner, while Japan remains China's number three trading partner after the European Union and the United States.

However, at the popular level Chinese seethe at certain Japanese actions and attitudes. These actions include repeated visits by prominent politicians such as Jun’ichiro Koizumi, prime minister from 2001 to 2006, to Tokyo’s Yasukuni Shrine, which enshrines “war dead,” including perpetrators of wartime atrocities in China; repeated authorization by the Japanese Ministry of Education of textbooks that label Japan’s invasion of China as an "advance" rather than “aggression” or expansion or militarism; trade disputes that come and go; territorial issues such as conflicting claims to the Diaoyutai or Senkaku Islands; persistent signs of Japanese sympathy for the independence of Taiwan, a Japanese colony from 1895 to 1945; positive responses by Japan to pressures from the United States to enhance its armed forces under U.S.-Japan military agreements and in support of the George W. Bush administration’s “sole superpower” designs; and Japanese activists agitating for a boycott of the Beijing Olympics of 2008 on human rights and other grounds.

The seventieth anniversary of the Rape of Nanking was 13 December 2007, and China remembered. For a

Jardine Matheson Group

Yíhé Jítuán 怡和集团

Jardine Matheson Group is an Asia-based conglomerate and the oldest of the original Hong Kong trading firms. The firm played an instrumental role in the opium trade in China, which resulted in the Opium Wars and the establishment of the British colony of Hong Kong.

Building on earlier trading networks, Scottish entrepreneurs William Jardine (1784–1843) and James Matheson (1796–1878) founded Jardine Matheson near Guangzhou (Canton) in 1832. After the British Parliament’s revocation of the East India Company’s commercial privileges in 1833, Jardine Matheson sent its first delivery of Chinese tea to England in 1834. The firm quickly established a leading position in trading, shipping, banking, insurance—and opium trading.

Opium proved to be Jardine Matheson’s most profitable commodity. British imports of Chinese tea had created a major trade imbalance between England and China, but smuggling of south Asian opium—a narcotic illegal in China—reversed the balance of trade in Britain’s favor. In 1831, before the official creation of the firm, William Jardine wrote that “our principle reliance is on opium” (Robins 2006, 142). The Chinese emperor’s response to the spread of opium proved to be a turning point in China’s relations with the European powers.

To halt the growing incidence of opium addiction, the Chinese emperor empowered imperial commissioner Lin Tse-hsü (Lin Zexu, 1785–1850) to put an end to the trade. On 18 March 1839, Lin issued a decree requiring British traders to relinquish their opium stockpiles under pain of death. In turn, the British superintendent of trade, Captain Charles Eliot (1801–1875), ordered the merchants to turn over their opium stockpiles to him; Eliot then handed over the opium to Lin, who destroyed it over the traders’ furious objections. In response Jardine Matheson and other British merchants called for armed intervention to protect their commercial interests. The resulting First Opium War ended in a stunning Chinese defeat.

With the Treaty of Nanking in 1842 China opened five “treaty ports” to trade and ceded Hong Kong Island to Great Britain. Jardine Matheson was the first British company to buy land in the new colony and sited its headquarters there in 1844. The firm quickly established a leading position in trading, shipping, banking, insurance—and opium trading.

In the twentieth century the firm weathered a series of financial setbacks brought on by World War II, the Communist revolution in 1949, and increased competition from Chinese businesses. In 1984 Jardine Matheson reincorporated in Bermuda in advance of Hong Kong’s handover to China on 1 July 1997. The Keswick family, descended from William Jardine, continues to exercise a controlling influence over the firm. Jardine Matheson today retains a leading position in Asia with holdings in insurance, motors, supermarkets, and hotels.

Matthew E. CHEN
Jardine Matheson and the Hong Kong Trading Industry

Jardine Matheson & Company is well-known British firm that established its presence in Asia over 150 years ago. This extract comes from a description of the Hong Kong trading industry as an adaptive ‘ecosystem’ based on trade, equity, and debt relationships that reduced business risk, an approach that is likely to receive increased scrutiny as businesses and governments seek new, sustainable models for global enterprise.

To each of its subsidiaries and to the firms for which it acted as principal and agent, Jardine Matheson provided a cluster of capabilities that included trading, banking, maritime insurance, and shipping—the same services historically known in the China trade as “agency services.” Underlying these was a network of relationships built and sustained by frequent communications and the development of logistical and organizational routines to facilitate trade. Jardine Matheson not only handled direct imports and exports to and from Hong Kong but also handled third country trade, where the firm acted as a middleman. Jardine purchased raw materials and sold finished projects throughout the world, served as the eyes and ears of major clients, provided them with global market information and analysis through its associates and subsidiaries, and helped smooth out the rockers road their clients faced in dealing with foreign languages, foreign currencies, and foreign governments.

Further Reading
Jian Zhen, a Buddhist monk who did much to bring Buddhism to Japan, is credited with founding the Ritsu school, which concerns itself with the proper observation of monastic rules.

Jian Zhen began his studies at the Dayun temple in Yangzhou, and at the age of twenty he went to Chang'an to further his education. By the time he returned to Yangzhou, at age twenty-six, he was well versed in Buddhist scriptures, in architecture, in literature, and also in medicine. Soon after his return he was elected the abbot of Daming monastery in recognition of his great learning and his piety; he won over large numbers of converts to Buddhism and also had many of the important scriptures copied in order to make them more widely available. His reputation as a sage spread quickly, and he began to attract students from all over China as well as Japan.

In 742, a delegation of Japanese monks who had been studying in China came to Yanzhou to request Jian Zhen to travel to their homeland to teach the Buddhist way. Jian Zhen readily agreed, and the very next year he collected monks and craftsmen for the mission and set forth to propagate Buddhism in Japan. But his attempt to cross the East China Sea failed, as did four further attempts to cross over to Japan. Then, in 748, he tried again for the fifth time. But his ship was blown off course and he landed in Hainan Province, from where he made his way back to Yangzhou on foot and by boat. The journey was difficult, and along the way he contracted an eye infection; by the time he got back to his monastery he was blind.

In 753, Jian Zhen learned that a Japanese deputation in China would soon be returning home; he succeeded in securing a place on their ship. Thus, on his sixth attempt, Jian Zhen finally arrived in Japan, where he was eagerly received by the Emperor Shōmu and Empress Köken, whom he instructed and then ordained as Buddhists. It was at the ancient temple of Todai-ji, in Nara, that Jian Zhen took up residence. During the ten years that followed, Jian Zhen preached the Buddhist way to the nobles of the land, who came from near and far to hear him and to be ordained by his hand. Jian Zhen’s learning in Buddhist scriptures and his ability to expound simply what was contained within them made his style of preaching immediately accessible. This brought him much renown and the number of his disciples increased. The school of Buddhism that Jian Zhen followed and preached was the Ritsu rite, which focused on the discipline of monasticism. Jian Zhen thoroughly expounded the *vinaya* texts, which focused on the discipline required of monks; he centered his exposition specifically on the *Dharmaguptaka Vinaya*, in which the process of monastic vows and duties is detailed, and discipline is emphasized over doctrine.

Although his chief aim was preaching Buddhism, Jian Zhen had also brought with him many monks and craftsmen who imparted Chinese knowledge of medicine, printing,
architecture, and sculpture to the Japanese. Thus, missionary work went hand-in-hand with cultural exchange, since many of the monks that traveled with Jian Zhen were gifted artisans, writers, and physicians. Along with Buddhist doctrine, Jian Zhen brought to Japan the Chinese knowledge of architecture, dwarfed potted trees, calligraphy, printing, medicine, and literature. He also established several temples and monasteries in order to educate Japanese novices.

At the age of seventy-one, Jian Zhen retired to a house and property given to him as a gift by the emperor, where...
he established a school as well as a small temple he named Toshodai-ji, which still stands on the western section of Nara, Japan. Jian Zhen died at this temple, and at first the monks tried to mummify his body and to show it sitting in a meditative pose. But the process failed, and his remains had to be cremated. Where the mummy had sat, the monastic community placed a statue showing Jian Zhen in meditation; it is said that this statue may have been finished just a few years before his death. This statue may still be seen in Toshodai-ji temple.

Jian Zhen was responsible for invigorating Japanese cultural and religious life by introducing into both ideas, practices and technologies that would align the island nation with the very best that Tang China had to offer.

Jiang Zemin succeeded Deng Xiaoping as the paramount leader of China in the 1990s and continued to pursue economic reforms and improved relations with the West into the twenty-first century. He served as General Secretary of the Chinese Communist Party from 1989 to 2002 and as Chairman of the Central Military Commission from 1989 to 2004.

Jiang Zemin was born into an intellectual family in Yangzhou, Jiangsu Province. He graduated from Shanghai Jiaotong University with a degree in electrical engineering in 1947. While at school, he participated in underground student activities led by the Chinese Communist Party (CCP). He joined the CCP in 1946 and worked in various economic- and industrial-related Communist government positions; he studied at Moscow’s Stalin Automobile Works in 1955. During the Cultural Revolution (1966–1976), his part in the industrialization of China saved him from persecution by the Red Guard.

As an advocate for economic reform, however, he prospered after the 1978 rise of Deng Xiaoping (1904–1997), becoming mayor of Shanghai in 1985 and Shanghai’s CCP first secretary in 1987. Massive protests took place across China in 1989, culminating in the Tiananmen Square incident in June; perhaps because of his ability to
peacefully defuse Shanghai’s own pro-democracy demonstrations, Jiang was chosen by Deng Xiaoping as CCP general secretary in June 1989, and he became chairman of the Central Military Commission in November 1989. He became China’s president in March 1993, thus holding the three most senior positions in the military, party, and state branches of power in China.

After 1989, Jiang strengthened his authority in China more than most observers thought he would. He continued to follow reform policies and worked to strengthen the CCP’s power and to eliminate the widespread corruption within it. He presided over the transfer of Hong Kong from British to Chinese control in 1997, played an active diplomatic role by traveling abroad many times, and worked hard for China’s accession to the World Trade Organization in 2001. During Jiang’s tenure, Beijing was chosen to host the 2008 Summer Olympics; he was present at the 8 August opening ceremony. One of his most controversial decisions was to suppress the quasi-religious movement Falun Gong (1999). In a highly important ideological proposal, made in a major speech he gave in July 2001, Jiang asserted that private entrepreneurs and other members of classes previously regarded as exploitative should be welcomed into the CCP, as long as they made a contribution to China and to socialism.

Jiangsu—a populous, developed province on the eastern seaboard about the size of Iceland—has enjoyed recent double-digit rates of economic growth. The success of rural industrialization driven by local governments and foreign investment, however, has further widened the gap between a prosperous Sunan (southern Jiangsu) and an impoverished Subei (northern Jiangsu). Accounting for only 1.1 percent of China’s territory, Jiangsu 江苏 is the fifth-most populous and the fifth-most densely populated province. Located on the eastern seaboard of China, it is the most low-lying province in the nation. It borders Shandong Province to the north, Anhui Province to the west, Zhejiang Province to the south, and the municipality of Shanghai to the southeast. Jiangsu straddles the lower course of the Yangzi (Chang) River and has relatively...
mild temperatures and abundant precipitation. In terms of both regional cultures and environments, Jiangsu is often considered a transitional zone between north and south China. Nanjing is Jiangsu’s capital and largest city, with an estimated 2007 population of 7.41 million.

Rapid economic growth and persistent uneven development distinguish Jiangsu from other provinces. Since the Tang dynasty (618–907 CE), it has been one of the most prosperous provinces in China. Its early economic development was due in large part to an efficient water-transportation system consisting of numerous rivers and the Grand Canal, as well as to sophisticated technologies in agriculture, industry, and trade. The post–Mao Zedong (1893–1976) economic reforms in China have further accelerated the growth of Jiangsu, whose gross domestic product (GDP) per capita grew at an average rate of 13 percent from 1990 to 1999 and 12 percent from 2000 to 2006, both exceeding the national rates. In 2007 Jiangsu’s GDP per capita was 33,689 yuan ($4,430 USD), 80 percent higher than the national level and fifth among all Chinese provinces.
Jiangsu’s recent economic growth is in no small part due to foreign investment and rural industrialization. “Open” cities and zones, such as Suzhou, Wuxi, and Kunshan, were designated to attract foreign investment. Equally important, rural industrial enterprises—often referred to as township-village enterprises (TVEs)—that have benefited from the leadership or management by local governments, have fueled economic growth. The prominence of TVEs in Sunan (southern Jiangsu), which borders Shanghai and Zhejiang and is part of the agriculturally and industrially prosperous Yangzi Delta, has popularized a “Sunan model” of development emulated in other parts of China. In Kunshan, for example, where tens of thousands of investors, mostly from Taiwan, live and work, numerous development zones and industrial parks have been developed, industrial enterprises are scattered among rice paddies and wheat fields, and a major center of information technology is emerging.

But as well known as Jiangsu’s rapid growth is its persistent disparity. The gap between the prosperous and resource-rich Sunan and the impoverished Subei (northern Jiangsu) is as large as that between China’s richest and poorest provinces, and it has widened further since the economic reforms. Though a transitional Su-zhong (middle Jiangsu) falls between the two extremes, Jiangsu remains a classic example of the simultaneous processes of rapid growth and spatial polarization that accompany China’s miraculous economic success.

Venerable Nanjing

Nanjing, the capital and hub of Jiangsu Province, is a city with a rich cultural history, a famous university, and a recent tragic past. Today, the city is very popular with tourists, as this blog about the city’s sites and attractions attests.

So you’ve made your way to venerable Nanjing, and you’re standing by the paifang at Sun Yat-sen’s Mausoleum. Mount Zijin, rising up behind it, seems more brown than purple. You try to muster the appropriate sentiment for this tribute to one of modern China’s greatest heroes, but it’s not easy…

Now imagine if you’d been there on June 1st, 1929, the day Dr. Sun was interred at the mausoleum. Stern Kuomintang generals stand gravely by, trembling with tears. The sense of loss to China, and her children’s depthless respect for the dead hero, are palpable.

Quite a bit more emotionally engaging than scenario A, to say the least.

So when you make it to Nanjing, by all means stop at the mausoleum. Do attempt a grasp at the history emanating from Confucius Temple… But to become one with Nanjing, however temporarily, commit to a meal at one of its famed restaurants.

Nanjing cuisine is known as Jin Su, or Jin Ling. It has lingered, understandably, in the shadow of Shanghai cuisine’s endless munificence… Salted duck, Eight-Delicacies Soup, Longchi carp, these classics and others await at the following restaurants, outstanding for their histories as well as their fare.

Jiangxi Province

Jiāngxī Shěng 江西省

43.68 million est. 2007 pop. 166,600 square km

The home of China’s largest freshwater lake and a portion of the world’s longest manmade waterway (the Grand Canal), Jiangxi is a landlocked, subtropical province in China’s southeast about the size of the state of Wisconsin. Rice is very important to the economy, with two or even three harvests a year in some locales.

The landlocked, southeastern Chinese province of Jiangxi (Chiang-hsi, Kiangsi) covers an area of 166,600 square kilometers (slightly smaller than the state of Wisconsin) and borders on the provinces of Hunan in the west, Hubei and Anhui in the north, Zhejiang and Fujian in the east, and Guangdong in the south. Hilly and mountainous areas account for three-fourths of the area, which is traversed by rivers that flow into Lake Poyang, China’s largest freshwater lake, situated in a 20,000-square-kilometer lowland area in the north of the province. While the mountains in Jiangxi rise from 1,000 to 2,000 meters, the low area in the north rarely exceeds 50 meters above sea level. The climate is subtropical, with plenty of rain, averaging 1,500 millimeters annually. This makes the province perfect for agriculture. A total of 99 percent of the population are Han Chinese. The capital, Nanchang (est. 2008 pop. 2.3 million), is situated in the northern lowlands.

Jiangxi remained sparsely populated until the Tang dynasty (618–907 CE), when it was connected to the ancient capital of Xi’an by the Grand Canal, the world’s longest manmade waterway. (In March of 2008, China applied to the United Nations Educational, Scientific, and Cultural Organization (UNESCO) for World Heritage Site status for the canal.) During the Song dynasty (960–1279), Jiangxi became a center of political and cultural eminence and the resort of famous scholars, such as Zhu Xi (1130–1200). With the fall of the Song, the intellectual milieu declined, and in the following centuries
the mountainous border regions became strongholds for antigovernment rebels. During the Qing dynasty (1644–1912), Jiangxi experienced peace and unprecedented wealth. This, however, was terminated with the Taiping Rebellion (1851–1864). In the early 1930s, Jiangxi became the battleground between the Communists and Nationalists, and from 1938 to 1945, the province was occupied by Japan.

Since 1949 economic development has grown steadily. Rice is by far the most important crop; most areas have two harvests a year and some have three. Other major agricultural products are rapeseed, peanuts, and cotton; Jiangxi is also one of the most important tea producers in China, with a tea-planting history going back to the eighth century. Jiangxi also produces a large amount of pork and exports its timber and bamboo to the rest of China. Industry is concentrated in the larger cities, and products include diesel engines, trucks, tractors, and aircraft. In the northeast, the famous imperial kilns of the Ming dynasty (1368–1644) still produce high-quality Jingdezhen porcelain.

Jilin Province

Jilin Province in northeast China is both an important industry base and a rich source of the country’s commodity grains. Ethnic Koreans make up a relatively large part of its population. Jilin is about the size of the state of North Dakota with roughly forty-three times the population.

Jilin Province is located in the northeastern region of China. Bordering Russia on the east and North Korea on the southeast, Jilin also shares borders with Liaoning Province on the south, Heilongjiang Province on the north, and the Inner Mongolia Autonomous Region on the west. It has an area of about 187,000 square kilometers. About forty minority groups live in Jilin Province, including Koreans, Mans, Huis, and Mongolians.

The eastern part of the province is close to the Yellow Sea and the Sea of Japan, where the atmosphere is moist, often with much rain. The climate of its western part, which is far from the sea and approaches the arid Mongolian Plateau, is dry. As a whole, Jilin has a temperate continental monsoon climate with a clear-cut change of seasons. The yearly average temperature of most of the province is 3–5°C. With hot and rainy days occurring in the same season, the climate is good for farming. The frost period begins in the last ten days of September and lasts until the end of April or early May.

Jilin is rich in natural resources. Major minerals are coal, iron, copper, zinc, and gold. Coal is mined in the southeast. The major hydroelectric power installation, the Fengman station on the Sungari River southeast of Jilin, provides much of the energy needs for the northeast region. Jilin also has abundant forest resources. One of the major forests in China, Changbai Mountain Area, produces top-grade pine trees and is the source of precious traditional Chinese herbs such as ginseng and pilose antler. Changbai Mountain Area’s mushrooms and fungi are regarded as of best in the country.

Jilin is one of the important commodity grain bases in China. It abounds with soybean, corn, sorghum, millet, rice, small red bean, wheat, tuber, sunflower seeds, beets, and tobacco. About 2.96 million hectares of prairie in the province’s northwest make Jilin Province an ideal place for animal husbandry; it has abundant pasture land for sheep and is a major production base of commercial cattle.

Jilin Province has a solid industrial infrastructure, with more than fourteen thousand industrial enterprises and six dominant industries: engineering, petrochemical, pharmaceutical, food, metallurgical, and forestry. With Changchun-based First Automobile Works, one of China’s most important automobile manufacturers, Jilin leads the country in its production of automobiles, railway cars, and tractors.

Changchun, the provincial capital with an estimated 2007 population of 7.46 million, is the economic, cultural, and education center of the province. It became the capital of Japanese-controlled Manchukuo in the 1930s. Today’s Changchun is a beautiful city shaded by trees. The Changchun Film Studio is the first film production factory built after the founding of the People’s Republic of China in 1949. It is regarded as the cradle of modern Chinese cinema.

As early as the sixth century CE, the city of Jingdezhen produced ceramics. It went on to specialize in making ceramics for the imperial courts.

The city of Jingdezhen, sometimes referred to as Fowliang, has long been known for its production of high-quality ceramics—specifically, porcelain. Jingdezhen is located in the northeastern part of Jiangxi Province, which is in southeast China, just south of the Yangzi (Chang) River.

During the period between 1004 and 1007 porcelain production in the area began to focus on serving the imperial court. The name Jingdezhen derives from a reference to this period as the Jingde reign period of Emperor Zhenzong of the Northern Song dynasty (960–1126). Before 1004, the city was called Chang-nan, which means “south of the Chang River,” on the banks of which Jingdezhen lies. The suffix “zhen” of “Jingden-zhen” refers to the administrative status of “market town” (zhen), a status conferred during the Jingde reign. The growth and development of Jingdezhen porcelain in large part mirrors the development of Chinese porcelain since the early tenth century.

Pottery production in Jingdezhen can be traced to the Han dynasty (206 BCE–220 CE), when the city was known as Xinping. In 583 CE the court of the Chen royal family who ruled during the last part of the North and South dynasties (220–589 CE) received pottery from the region, and during the Tang dynasty (618–907 CE) on several occasions, Jingdezhen kilns supplied the emperor with objects. Then Jingdezhen’s relationship with the court underwent some starts and stops but began in earnest again during the mid-thirteenth century. Official imperial intervention and direct control by the court originated during the Yuan dynasty (1271–1279); specifically, in 1278 with the establishment of a porcelain bureau (ci jiu), porcelain was sent to the imperial court only at the specific order of the court officials in the capital. A director dispatched from the court to Jingdezhen oversaw the making and firing of porcelain and took responsibility for the affairs of the porcelain bureau. In 1295 the bureau expanded, and its director gained higher rank. In 1324 the bureau was incorporated with the local tax bureau, and by 1328 the provincial governor of Jiangxi Province acted as the inspector of porcelain production. Between 1352 and 1354 the kilns ceased production with the pending fall of the Yuan dynasty. Jingdezhen’s status as a porcelain producer that functioned mainly for the imperial court began in earnest during the early years of the Song dynasty. At the start of the Ming dynasty in 1368, an imperial porcelain factory was built on Pearl Hill (Zhushan), located in the southern part of the city. Thereafter, the quantity of porcelain production increased dramatically; the Ming and Qing dynasties, spanning the fourteenth century through the early twentieth century, were the most active periods of production and diversification of Jingdezhen porcelain objects, as measured by court patronage and numbers of export wares.

During the Ming and Qing dynasties porcelain produced in Jingdezhen imitated and sometimes surpassed the brilliance of various styles from other kiln sites: Styles included celadon wares of the northern and southern
kilns, which had reached their peak in the Song dynasty; the underglaze blue-and-white wares that attracted consumers worldwide; the blue-white wares (*yingqing*) with a shadowy blue tint popular during the Yuan dynasty; polychrome and monochrome glazes; and overglaze enamel. The availability of outstanding raw materials such as kaolin (a fine clay) and china stone (*petuntse*)—with superior durability, delicateness, high translucency, low porosity, and high firing temperatures (more than 1280° C)— contributed to the renown of Jingdezhen’s prolific history of porcelain production over the last one thousand years.

Today roughly half of Jingdezhen’s population actively participates in the porcelain industry. Over the last fifty years, since the late 1950s, the central government of the People’s Republic of China and the Jiangxi provincial government have invested in establishing ceramic research institutes, local museums, and ceramic vocational schools. While the modern status of Jingdezhen porcelain wares pales in comparison to the renown of its imperial past, Jingdezhen’s ceramic training institutes, research institutes, and porcelain industry continue to make it a destination for collectors, potters, and commercial buyers worldwide.

Jiuzhaigou

Jiǔzhàigōu 九寨沟

Jiuzhaigou nature reserve, located in the mountains of Sichuan Province, is one of the world’s most scenic areas. The reserve has more than one hundred rivers, lakes, and waterfalls covering 650 square kilometers.

The mountains, waterfalls, and rivers of the Jiuzhaigou nature reserve make it one of the most scenic areas in the world as well as a major tourist attraction. Jiuzhaigou is located in the Min Shan, a mountain range in the northern part of Sichuan Province in southwestern China, about 400 kilometers north of Chengdu, the capital of Sichuan Province.

The name “Jiuzhaigou” has an interesting origin. The words jiu, zhai, and gou mean “nine,” “tribe,” and “gully,” respectively. Because nine Tibetan tribes live in the Min valley, people began to call the area “Jiuzhaigou.” Located about 2,000–4,700 meters above sea level, the Jiuzhaigou reserve has more than one hundred rivers, waterfalls, and lakes covering 650 square kilometers. About 42 percent of Jiuzhaigou is forested. A number of endangered animals, including the giant panda (Alluropoda melanoleuca) and the golden snub-nosed monkey (Pygathrix roxellanae), live in Jiuzhaigou.

Jiuzhaigou has been called “the fairy-tale world” of China because of its natural beauty. The Chinese media has often used it as a film location. Because the number of visitors to Jiuzhaigou from all over the world has increased, in 2001 the government began limiting visitors to twelve thousand a day. About 60,000 hectares of the reserve were designated as a natural protective area in 1978 and were listed as a United Nations Educational, Scientific, and Cultural Organization (UNESCO) Natural World Heritage Site in 1992; 24,000 hectares became a UNESCO World Biosphere Reserve in 1997.

The Editors

Further Reading

Discussion of “journalism reform” emerged with fervor in the mid-1980s, revolving around journalists’ desire for more autonomy and reinforced by reformist politicians’ calls for greater informational transparency. In the 21st century, important changes in journalism hinged on the possibilities of new technologies, along with continued efforts to strengthen journalistic professionalism.

The news media played a key role in the initiation of China’s post-Mao political and economic reforms, acting as harbingers of change, promoting policy experiments, and documenting results. The press—with the Chinese Communist Party (CCCP) flagship paper People’s Daily taking a lead—eagerly took up the officially sanctioned shift from “class struggle” to “economic construction” from 1979 on as license to delve into social problems, proposing solutions, and inviting readers to join the discussion through expanded forums for letters and opinions. Similarly, the pragmatic admonition to “seek truth from facts” provided reporters and editors with a rationale for pursuing more rigorous practices in gathering and verifying information.

These were liberating changes from the conventions of the Cultural Revolution (1966–1976), now repudiated as a period when fabrication, imitation, prattle and bombast ruled the news. As pent-up grievances left over from the Cultural Revolution made their way into both public accounts and “internal” (neibu) reports for political authorities, the news media and journalists gained new respect as a kind of court of last resort that sometimes produced remedies.

Discussion of reforming journalism itself did not emerge with much fervor until the mid-1980s. Once the idea took hold, however, “journalism reform” became a common refrain in occupational and official circles, worthy of attention in conferences, forums, articles and speeches as essential for moving from outmoded propaganda models to modern concepts of news. The discussions incorporated journalists’ calls for professional autonomy, scholars’ revisions of goals of journalism in a socialist society, and public officials’ declarations of the need for greater transparency and accountability in the news media. Academics and legislators began to explore prospects for a national press law that would insulate the media from politics and expand journalistic independence.

These debates took place in a context of rapid recovery and growth of the news media that saw restoration of hundreds of newspapers, magazines and journals that had been suspended during the Cultural Revolution, and establishment of thousands of new outlets. Radio and TV underwent tremendous growth as well, as did advertising, long banned and now reintroduced as a primary means of financing. College and university journalism programs proliferated, with curricula drawing on foreign methods of both teaching and practicing journalism. At the same time, the institutional structure and prescribed mission of China’s news media underwent little change, and in practice media remained beholden to state and Party authorities even amidst mounting pressures for greater...
responsiveness to citizens and consumers. Such tensions between loyalty to official dictates and accountability to the news audience reached their height during the 1989 Tiananmen student demonstrations, which many journalists joined, and which earned sympathetic coverage until the crackdown.

A new phase of journalism reform unfolded with the renewed emphasis on economic development initiated by Deng Xiaoping’s southern tour in 1992, in which the eighty-eight year old CCP leader made a surprise visit to some of the Special Economic Zones he had established in the early 1980s. In line with the development of the market economy, media organizations were expected to become self-supporting. State subsidies in the form of both direct support and government subscriptions were withdrawn, and new media startups were premised on commercial models—even as technically, all media outlets still required sponsorship from Party or government organizations. Through the 1990s, domestic media conglomerations was encouraged, with major print and broadcast organizations in China’s provinces and cities combining into larger enterprise groups (jituan); and although foreign investment found its way into supporting aspects of media industries, such as technology and distribution, outright foreign ownership remained prohibited.

In the twenty-first century, new technologies began to transform Chinese journalism in ways familiar throughout the world, producing an expansion of both institutional and popular communication in cyberspace, encouraging visual and multi-media methods of presentation, and providing diverse alternative channels for news and information that, despite state efforts to reign in and filter the Internet, could not be thoroughly controlled. Chinese news organizations have embraced technological innovations to enrich their content and expand their reach, while journalists have welcomed the new opportunities for individual expression through blogging.

Yet many stresses and strains remained among competing interests in the journalism mix, including the state and Party’s continued insistence on leading and molding communications, increasing emphasis on professionalism among journalists themselves, growing public access to a multiplicity of channels of information, the heightened importance of economic return, and China’s increasing integration into the global marketplace.

**Journey to the West**

Xīyóu jì 西游记

Xīyou jì (Journey to the West), a Chinese novel believed to be written by Wu Cheng’en in the sixteenth century, portrays the adventures of a priest, a monkey, and their pilgrim band as they journey to get Buddhist scriptures. The tale, long shared through various media in China, is rich in allegory and instruction from Daoist, Buddhist, and Confucian thought.

The novel Xīyou jì (Journey to the West) is a favorite source adapted in storytelling, opera, theater, puppetry, comics, television, and video games both in China and abroad. It can be interpreted as a fairy tale, a humorous piece of literature, a religious allegory, or an adventure tale.

The beginning of the hundred-chapter novel introduces Sun Wukong (Monkey), born from a stone and nourished by the five elements. He leads a band of monkeys on the Mountains of Flowers and Fruits until he goes in search of a spiritual teacher, finding the Daoist master Subodhi. Given the spiritual name “Aware of Vacuity,” he soon learns the Dao and seventy-two transformations but is forced to return home after showing off his magic skills.

Monkey soon declares himself the “Great Sage Equal to Heaven,” creating havoc by consuming the peaches of immortality, stealing Laozi’s golden elixir pills, and destroying much in Heaven. The Jade Emperor, a rich source of satire in the novel, can’t control Monkey, so Lord Buddha must intercede. Monkey proudly accepts and loses a challenge from the Buddha and thus is imprisoned in a stone mountain.

Chapters 8–12 introduce the priest Xuanzang and tell the tale of his parents’ troubles. Next, at the Buddha’s

In this Suzhou Opera performance commemorating the 30th anniversary of the People’s Republic of China, the Monkey creates havoc in Heaven.

*Photo by Joan Lebold Cohen.*
request, the bodhisattva Guanyin (a being that refrains from entering nirvana in order to save others, and who is worshipped as a deity in Mahayana Buddhism), selects the priest to bring precious Buddhist scriptures from India. Xuanzang, now called Tripitaka or Sanzang, sets out with the emperor’s blessing. His character on the journey is often that of a fussy, whining man, yet one with a kind heart who will need some help on his quest. Chapters 13–22 describe the protectors and fellow pilgrims whom he meets:

- Sun Wukong (Monkey) is a vibrant, good-hearted creature whom readers have already met in the book’s early chapters. His weapon is the “will-following golden-banded staff,” which can grow to an enormous size or shrink to fit behind his ear. He also obtains a pair of lotus-root cloud-walking shoes, a phoenix-winged purple and gold helmet, and a suit of golden chain mail. The bodhisattva Guanyin gives him three life-saving magic hairs to help him on his travels, as well as a headband, which, when activated by a chant from the sacred scripture Tripitaka, will cause Monkey pain and allow Guanyin to control Monkey’s volatile nature.

- Zhu Bajie (Pigsy) is an immortal who was called “Field Marshall Tianpeng” until he drank too much, flirted with the moon princess, and came to Earth by mistake as a pig-like creature. He is a powerful fighter who uses the nine-tooth iron rake, can do thirty-six transformations, and has a large appetite for sensual pleasures.

- Sha Wujing (Sandy), once the curtain-raising general, was banished to Earth for accidentally breaking a crystal goblet. He knows eighteen transformations, fights well in water (his weapon is the monk’s spade), and is the most polite and obedient of the disciples.

**Dragons and Demons**

These characters are helped by the Third Prince of the Dragon King, who turns into a white horse so Tripitaka can ride him to escape punishment. A succession of struggles follows, lasting almost to the novel’s end, which take place in a wilderness with flaming mountains, impossibly wide rivers, and a long list of monsters: Green Lion Demon, White Elephant Demon, Dream Demon, and Nine-Headed Bird Demon among many. Often these creatures hope to eat Tripitaka’s flesh to gain immortality. After eighty such episodes, with help at times from Guanyin and Laozi, members of the weary band at last reach Vulture Peak, receiving wordless scriptures that they exchange for others with written words. To make the number of tests an auspicious eighty-one (corresponding to the number of chapters in Laozi’s *Daodejing*, they undergo one last test and then receive their rewards: Tripitaka and Monkey become Buddhas, Pigsy is named an altar cleanser, Sandy becomes an arhat (spiritual practitioner), and the white horse becomes a heavenly dragon.

**Early Versions**

Various earlier versions of the story, both oral and written, were inspired by the real-life experiences of the priest
Journey to the West

Xuanzang (602–664), a monk at Jingtu Temple in Chang’an during the Tang dynasty (618–907 CE) who endured great troubles as he traveled to India to get Buddhist scriptures. He spent seventeen years on his journey and returned with many precious volumes. Praised by Emperor Taizong, he then spent the rest of his life translating the scriptures into Chinese. As his story changed and grew after his death, the other pilgrims were added along with a cast of otherworldly creatures and a long list of struggles.

Importance of the Work

The story, shaped by oral storytellers as well as writers, took its final form as a hundred-chapter novel in the sixteenth century. Although scholars debate the issue, most agree that Wu Chen-en, a writer known for his poetry, humor, and love of the marvelous, was the author of the novel.

As a work both told and read, Journey to the West has long been one of the most popular stories in China, enjoyed for its humor and its use of verse in dialogues, for description, and for commentary. It appeals to all ages because it both entertains and instructs, poking fun at the Chinese court and at religious traditions, while also offering an allegory of the spiritual quest.

The novel includes Daoist, Buddhist, and Confucian thought. Alchemy and the art of transformation appear repeatedly, along with teachings of the Dao. Buddhist characters and scriptures play an important role, with the Buddhist Heart sutra (a precept summarizing Vedic teaching) often chanted by the priest Tripitaka to cultivate truth, being included in some editions. The accumulation of merit is a recurring Buddhist theme, with many good deeds done on the journey: restoring kingdoms, freeing the enslaved, helping orphans, and more. The Buddhist need for compassion is stressed, with the necessity for self-cultivation reinforced. Confucian thought is reflected in an emphasis on correct conduct, learning, and order in society.

Various editions of the story have appeared in English over the years, including a popular version translated by Arthur Waley and abridged by Alison Waley, and two complete translations, one by Anthony C. Yu and the other by W. J. F. Jenner. Whether read in these or other editions or seen on television, on film, or in the opera, the story has been beloved by generations.

Further Reading

Drawn by China’s rich culture and, for most of its long history, by its religious tolerance, many traders, missionaries, and scholars from abroad settled permanently in this vast country. China’s environment was particularly attractive to Jews, and those wishing to emigrate formed sizable communities in many Chinese cities.

For most of its many centuries China was a reasonably tolerant country. That factor, combined with its rich culture, made it an attractive place to which many traders, missionaries, and scholars were eager to emigrate. Sizable communities of Jews formed throughout China’s history, particularly in the cities of Kaifeng, Shanghai, Harbin, and Tianjin.

Kaifeng

Kaifeng’s thriving economy attracted many Jewish traders and merchants who most likely came from central Asia along the Silk Roads. Although the exact date of the Jews’ arrival in Kaifeng is not known, most scholars believe that they arrived during the Song dynasty (960–1279). Unlike Jews who settled in other Chinese cities to flee persecution, the Jews who moved to Kaifeng did so by choice and enjoyed a relatively positive relationship with Chinese authorities. The Jews greatly respected the Chinese rulers and their laws, and the Chinese officials, in turn, were tolerant of Jewish religious practices and beliefs.

For centuries the Kaifeng Jews maintained a remarkable balance between assimilating into Chinese society and preserving their Jewish identity. They adopted Chinese names as well as the Chinese language, dress, and way of life, but they adhered strictly to their traditional religious practices and customs. In 1163 the Kaifeng Jews were the first Jewish community in China to erect a synagogue, which remained for almost seven hundred years as a place of worship for Jewish believers in China. They observed most or all of the holidays, Sabbath services, and rites of passage and preserved the Torah scrolls and Hebrew prayer books.

During the second half of the fourteenth century the Kaifeng Jewish population reached its peak—a golden age, so to speak—in which a majority of the Jews prospered in trade, intellectual pursuits, and civil service. Some served as court officials or military officers and others as scholars and physicians.

At the start of the nineteenth century the Kaifeng Jewish community had been in steady decline. When the Kaifeng line of rabbis passed away with no successors between 1800 and 1810, the knowledge of Hebrew in the community passed away with them. As a result of both natural and human-made disasters, most of the Kaifeng Jews had fallen into extreme poverty by 1860, leaving them unable to maintain their synagogue.

Today a small Jewish community still exists in Kaifeng and has become a major tourist attraction for Jewish visitors because the homes and streets in the Jewish section of the city have been preserved. Treated as a minority ethnic group, Kaifeng Jews receive a monthly allowance from the government and are not required to abide by the one-child policy. Recent visitors to Kaifeng have reported that...
the few surviving Jewish descendants in the city still have a strong Jewish identity and seek to preserve the Kaifeng Jewish legacy.

**Shanghai**

As an open city on the east coast of China, Shanghai had no immigration restrictions or visa requirements and thus became a haven for refugees from all sorts of persecution.

Three major groups of Jews came to Shanghai: the Sephardic Jews who arrived in the early nineteenth century, the Russian Jews who settled in the early years of the twentieth century, and finally the refugees from Hitler’s Europe in 1938 and 1939. Shanghai was also a transit station for twenty thousand to thirty thousand refugees who were looking to emigrate to the United States or Palestine in the years before World War II.

The majority of the Jews who arrived in Shanghai in the late 1930s were middle-class, white-collar workers,
skilled artisans, professionals, and businessmen. At the time of their arrival Shanghai was undergoing an economic crisis that prevented most of them from finding livelihoods. As a result, many were forced to relocate to other countries. The ones who did stay settled mostly in the Japanese-occupied district of Hongkou and kept to themselves, rarely interacting with other foreigners or even the Chinese. During this time Shanghai was under Japanese rule. But rather than echo the racial policies of their Nazi allies, the Japanese occupiers to some extent perceived the Jewish refugees as professionals and businessmen. Although treatment of the Jewish population ranged from indifference to militaristic abuse, the authorities welcomed refugees into China and did not implement any organized policy of extermination. By 1967, however, records indicate that only fifteen Jews remained in Shanghai, and a Hong Kong newspaper reported the death of the last Jewish refugee in Shanghai in 1982.

Little physical evidence remains of Shanghai’s former Jewish community. The Sephardic Jews built two beautiful synagogues in Shanghai. For a number of years Jewish study and research flourished in the Ohel Rachel (1920) and the Beth Aharon (1927). Unfortunately, the former was demolished in 1952 and the latter in 1985. In recent years former Shanghai Jewish refugees have returned in hopes of finding remnants of Jewish life that they could photograph, but most of the Jewish buildings have either been demolished or put to use for other purposes.

Harbin

From the beginning of World War I to 1932, the Russo-Manchurian Treaty of 1897 allowed Russians to build the Chinese Eastern Railway. Harbin grew to become the administrative center of the Chinese Eastern Railway. Along with the Russians, many Jews came into Manchuria during this time. In the first half of the twentieth century Jews in the city numbered over twenty thousand, which made it one of the largest Jewish communities in China.

The Jews in Harbin created many cultural and social establishments for themselves, building synagogues and hospitals as well as forming clubs and newspapers. Harbin was hospitable to a Jewish community that contributed to the rich and diverse culture of the city and introduced the people of Harbin to European culture, values, and lifestyles. The Harbin Jews also greatly influenced the economics of the city, especially in industry, commerce, and real estate. Jewish businesses contributed significantly to the development of Harbin’s economy and international reputation.

The largest and best-preserved Jewish cemetery in Asia lies in downtown Harbin, although it has been closed for new burials since 1958. There were more than 3,100 graves in this cemetery, which has great historical significance as a publicly visible representation of the Jewish cultural styles of the first half of the twentieth century. About six hundred graves with tombstones (and some two hundred more marked with tablets) have been moved to a new cemetery site in Huang Shan, about 50 kilometers north of Harbin. In addition, Harbin was the home of the largest Jewish synagogue in northeast China, the New Jewish Synagogue, from 1921 to 1956. The Jewish community in Harbin survived for nearly a century, from roughly 1899 to 1985. However, by the 1930s Harbin Jews had begun to scatter across eastern Asia due to economic crises and persecution by the Soviet army. After World War II many Harbin Jews moved away, mostly to Israel, the United States, Europe, or Australia. Some moved to Shanghai.

Tianjin

Jews began to settle in Tianjin as early as the 1860s. They came mainly in three waves. The first wave came with the European merchants who poured into Tianjin when it opened as a commercial port in 1860. The second wave occurred between the end of the nineteenth century and the beginning of the twentieth century and consisted of Jews fleeing czarist Russia. The third wave, by far the largest, occurred during the years leading up to World War II as Jews fled Nazi rule. By 1935 the Jewish population of Tianjin reached its peak at 3,500.

The Jews of Tianjin maintained their own living patterns, apparently able to co-exist peacefully with the native population. They found a home among open, tolerant people and were able to live successfully as merchants, employees, and professionals. A synagogue built in 1940 still stands but is now used for other purposes.

Other cities with identifiable Jewish communities include Xi’An, Beijing, Hangzhou, Ningbo, Yangzhou,
Ninxia, Guangzhou (Canton), Quanzhou, and Nanjing. Under Communist Party leader Mao Zedong these communities were allowed to exist but certainly not to participate in the political life of the country. Today, however, the economic resurgence of China puts its Jewish communities in a new light as possible assets in the global economy, especially the worldwide tourism industry.

The junk has been the classic Chinese ship design since the Han dynasty (206 BCE–220 CE), and is still in use today. With a flexible, usually flat-bottomed design that allows it to navigate both rivers and the open sea, the junk has been put to many uses over the years, from warfare to commerce.

The junk is the basic traditional Chinese ship design, flexible enough to be used for river and oceangoing vessels of various sizes. The junk’s predecessor apparently was a bamboo raft with flat ends and many internal compartments separated by bulkheads. That design was adapted into a variety of easily maneuvered vessels. The junk originated during the Han dynasty (206 BCE–220 CE) and by the ninth century was plying international waters in Southern and Southeastern Asia.

Multiple internal bulkheads created a series of watertight compartments that gave the junk further stability and seaworthiness. Older junks lacked a keel and instead relied on thick wales (planks) that ran along the sides of the vessel to provide rigidity. River junks normally had only one mast, although space was provided for oars in
The Superior Chinese Junk

China scholar Joseph Needham explains why the Chinese junk was superior to vessels found outside of China.

This is clearly a much firmer method of construction than that found in the ships of other civilizations. Fewer bulkheads were required than frames or ribs to give the same degree of strength and rigidity. It was obviously also possible for these bulkheads to be made watertight, and so to give compartments which would preserve most of the buoyancy of a vessel if a leak should occur, or damage below the waterline. In other ways also the bulkhead structure had various advantages, one example being the provision of the essential vertical support necessary for the appearance later of the hinged rudder. But we shall deal with such matters in due course.

the forward section, with cabins and other kinds of superstructures always placed aft of the mast. These junks could reach 46 meters in length, although most were 11–30 meters long and were used for all kinds of transportation. In areas where rapids or narrow channels caused difficulties in navigation, articulated ships (ones with a hinge or pivot connection to allow greater maneuverability) were built, although the basic junk design was retained.

Articulated ships could also be adapted for use in warfare: Incendiary devices were placed in the forward portion of a vessel that was then brought up to an enemy position, uncoupled, and left to explode. Oceangoing junks had a design similar to that of river junks but could reach 52 meters or more in length. The design of both types of junk provides for the greatest width of the ship to be at the rear, in imitation of aquatic birds. Many ships were built without the use of metal, the artisans instead preferring to use wooden pins. The flat-bottomed design also allowed comparatively large ships to dock in shallow waters or to navigate relatively small rivers or canals. Propulsion could be by sails or oars or a combination of both. Evidence of the first true rudder, connected to the ship by a post and balanced on an axis, is found on tomb models of Chinese ships from the first century CE. Today junks are still commonly used.

Jurchen Jin Dynasty
Nūzhēn Jin Cháo 女真金朝

The Jurchen Jin dynasty was founded in Manchuria by the chieftain Aguda in 1125. During its 109-year reign the Jurchen people combined tribal vigor with Chinese-style government, struggling all the while to preserve their ethnic identities. Although the dynasty was defeated by the Mongols in 1234, the Jurchen people were able to prosper and survive for several more centuries.

Two groups of Jurchen, a sedentary, Tungus-speaking people living in Manchuria and southeastern Siberia, existed in the eleventh century. One was a little-assimilated group of “raw” tribespeople living more or less the traditional life. The other was the “cooked” Jurchen, who had interacted closely with the Kitan, who, as the rulers of the Liao dynasty (906–1125), were the dominant political group at that time in north China, and with the many Chinese ruled by the Kitan.

The chieftain Aguda (1068–1123) of the Wanyan clan, the founder of the Jurchen state, was primarily a ruler of the “raw” Jurchen people, but he had learned how to use cavalry effectively in warfare from the Kitan. (Horsemanship and war on horseback were then not part of Jurchen native tradition but soon became an important part of Jurchen culture and the real basis of their military power.) Aguda had also learned how to form a state in the central Asian manner by joining heterogeneous elements, including Kitan tribesmen dissatisfied with their own government, to a Jurchen core.

After a series of raids conducted all along the Liao’s western frontiers, Aguda began attacks that captured the Liao subordinate capitals one by one, sometimes with the help of the Northern Song dynasty (960–1126), the native Chinese dynasty occupying the rest of China. Aguda died before completing his conquest of the Liao, but his successor, Wuqimai, or Taizong (1075–1135), not only completed the task but also began a massive invasion of the Song, his former ally. The invasion had attempted to make gains in the north as the Liao had collapsed at the expense of the Jurchen Jin.

New Dynasty

In the decades of war that followed, the Song dynasty was nearly destroyed; it was then reorganized as the Southern Song dynasty (1127–1279) under a collateral branch of the old imperial line based in the city of Hangzhou in central China. Not just the old Liao domains, which had been confined to the northeast, but the entire north came under Jurchen Jin control. China was divided between two equally powerful regimes, with a third regime, that of the Xi Xia state, occupying the northwest.

Even as the wars with the Song continued, internecine struggle (conflict within a group) divided the Jurchen Jin elite. The courts of Wuqimai and his successors had adopted Chinese forms of government in order to organize its new conquests. Many traditional elements of Jin society failed to understand why this was necessary; they felt
that their vested interests were in danger and that they faced absorption by Chinese culture. This conflict was still unresolved at the time of the Mongol invasions, and it was one of the reasons why the Mongols were able to conquer the Jin with relative ease—in part with some of the very same tribal allies that the Jurchen people had used in their own rise.

The Jurchen emperor at the time of the dynasty’s first Mongol crisis was Zhangzong (1168–1208), a sinicizer. He had begun a new war with the Southern Song in 1207 in which Jurchen cavalry had proven far less effective than in the past, indicating a weakening of a native Jurchen tribal base that was having more and more difficulty maintaining its traditional life, not to speak of the cavalry forces sanctioned by Aguda as part of this traditional life. The reign of Zhangzong also witnessed growing Jurchen Jin problems with its other tribal groups, principally with the Kitan of the Sino-Mongolian frontier zone. In 1207 most of the peoples involved revolted, handing what is now Inner Mongolia over to the Mongols, who used it as a base for raiding and expansion.

The Jurchen Jin, who had once actively intervened in the steppe and had manipulated events there in its own interests, build fortifications in response to the Mongol threat. These proved to be no barrier whatever to the Mongols, who began a general assault on the Jurchens in 1211. During the next twenty-three years they conquered Jurchen Jin territory piecemeal. They took the principal capital of Zhongdu in 1215 and consolidated their rule in much of the north with a great deal of local help, including from Chinese warlords, the Kitan, and even Jurchen allies. Forced to retreat to its domains along the Huang (Yellow)
River, the Jurchen court held out for another nineteen years thanks to Mongol preoccupation elsewhere, principally with a campaign in the west (1218–1223) and the conquest of Xi Xia, and then with an interregnum (the time during which a throne is vacant between two successive reigns or regimes).

**Mongol Assault**

When the Mongol khan (sovereign) Ogodei (1185–1241) gathered his resources and refocused Mongol attention on China, the Jurchen Jin dynasty came to a close. Mongols assaulted the capital, then at Kaifeng, from several directions. The Jurchen Jin court fled south to Caizhou, where it attempted to organize further resistance. Kaifeng fell in 1233 and Caizhou in February 1234. The last Jurchen Jin emperor committed suicide.

Unlike the Tangut of Xi Xia, who were virtually exterminated resisting the Mongols, the Jurchen survived and prospered when their dynasty ended. The Jurchen had their own native scripts, based loosely on Chinese, and these survived into the sixteenth century. Later the same cultural groups that had given rise to the Jurchen produced the Manchu, who had their own “raw” and “cooked” components and who also tried to combine tribal vigor with a Chinese style of government. They had even less success than the Jurchen in maintaining their ethnic identity during their reign of China, and the once-large Tungus population of Manchuria is all but extinct today.

KANG Youwei

Kang Yŏuwéi 康有为

1858–1927 Scholar and political reformer

Kang Youwei 康有为, as one of the engineers of the Hundred-Day Reform of 1898, championed for a strong constitutional monarchy in place of Qing imperial rule to facilitate the modernization of China. A coup by conservative elements toppled him from power. Kang fled to Japan and continued to promote constitutional monarchy for China.

Born in Foshan, Guangdong Province, to a scholar-official family, Kang Youwei was raised to be a devoted Confucian and a nationalist. Viewing the unceasing foreign penetration into China, Kang was determined to help the country preserve Chinese cultural heritage. After failing the civil service examination in 1888, Kang turned his attention to education. In his native province he organized an academy that focused on restudying Confucianism and learning Western knowledge in order to find self-strengthening measures to save the country. One of his students was Liang Qichao, who later worked with Kang to lead the Hundred-Day Reform in 1898.

China’s defeat in the First Sino-Japanese War (1894–1895) hardened Kang’s determination to urge more comprehensive reform, which a few officials and reformers, such as Feng Guifen in the 1860s, had proposed decades earlier. In the summer of 1895 Kang led one thousand students to Beijing to protest the peace terms imposed by Japan. Kang remained in the capital, where he founded study associations and newspapers and sent memos to senior officials, hoping to awaken the nation to the need to save the country through reform.

Kang’s patriotic zeal finally received attention from Emperor Guangxu, who recruited Kang in June 1898 to reform the Qing dynasty (1644–1912) government. Unlike the previous Self-Strengthening Movement, Kang’s reform program was much more comprehensive. While self-strengthening measures such as promoting economic development and military modernization and learning Western ideas and techniques would continue, Kang renewed Feng’s earlier demands of revising the civil service examination and educational systems. In addition, Kang proposed replacing imperial rule with a constitutional monarchy, modeled on Japan’s Meiji period (1868–1912). Kang urged that Emperor Guangxu should have the determination of Russia’s Peter the Great, who modernized and strengthened Russia as a great power in the early eighteenth century.

Long frustrated by the lack of real power and eager to restore China’s past glory, Emperor Guangxu accepted Kang’s ideas, entrusting him to implement the reforms. Kang, assisted by Liang, helped launch the Hundred-Day Reform. It began on 11 June 1898, but ended on 21 September 1898, as a result of the coup staged by the conservatives led by Empress Cixi, who feared that Kang’s measures would topple the foundation of Qing rule. Kang’s only success was the abolition of the Eight-Legged Essay in the civil service examination, which Feng had failed to achieve during the Self-Strengthening Movement.

After the coup Kang and Liang fled to Japan. There Kang published newspapers and established the Protect the Emperor Society, continuing his vision of a constitutional monarchy. Kang also traveled abroad to seek moral
and monetary support from overseas Chinese and foreign governments.

After the 1911 revolution, which resulted in republicanism, Kang returned to China and continued to push for a constitutional monarchy, reasoning that it was a necessary precondition for ultimate attainment of real democracy. From then until his death Kang made several abortive attempts to restore the dethroned Pu-yi, the last Qing monarch. His repeated failures owed much to his ignorance of the strong antimonarchist sentiments across the nation.

Kang died in Qingdao, Shandong Province.

Confucianism and Human Rights

*Kang Youwei, widely recognized in his time as a leading modern exponent of Confucianism, believed that China, and Confucianism itself, had to be liberated from a family system intrinsically repressive of the individual. Hard though it is to conceive of Confucianism stripped of its family system, this is what Kang had to say:

We desire that men’s natures shall all become perfect, that men’s characters shall all become equal, that men’s bodies shall all be nurtured. [That state in which] men’s characters are all developed, men’s bodies are all hale, men’s dispositions are all pacific and tolerant, and customs and morals are all beautiful, is what is called Complete Peace and Equality. But there is no means by which to bring this about this way without abolishing the family… To have the family and yet to wish to reach Complete Peace and Equality is to be afloat on a blocked up stream, in a sealed-off harbor, and yet to wish to reach the open waterway. To wish to attain Complete Peace and Equality and yet keep the family is like carrying earth to dredge a stream or adding wood to put out a fire, the more done, the more hindrance. Thus, if we wish to attain the beauty of complete equality, independence and the perfection of [human] nature, it can [be done] only by abolishing the state, only by abolishing the family.

Photograph of Kang Youwei, circa 1905.
During Emperor Kangxi’s sixty-year reign the borders of the Qing dynasty’s empire were strengthened, Manchu rule in China was solidified, and China’s economy, culture, and population prospered.

The sixty-year reign of Emperor Kangxi, from 1662 to 1722, was one of the longest and most successful in China’s imperial history. In addition to solidifying Manchu rule in China and countering Russian and Mongol threats along the empire’s borders, Kangxi proved himself to be a cultured and able administrator who skillfully bridged the divide between his nomadic Manchu heritage and the agrarian civilization of his Han Chinese subjects.

In the winter of 1661 Emperor Shunzhi, the first emperor of the Qing dynasty (1644–1912), contracted smallpox. On his deathbed he named his third son, Xuan Ye, as his heir, possibly because the youth had survived a battle with the disease that shortly was to claim his father, and people believed that this survival was a sign that the child would have a long life. Twelve days after his father’s death, Xuan Ye was proclaimed emperor and took the reign name “Kangxi.” Because the young emperor was only seven years old, a council of four regents was appointed to rule while the child was in his minority. After an abortive first attempt to assert his authority, Kangxi managed at age fifteen, with the help of his mother’s uncle and a group of loyal Manchu officers, to take control of the empire, thus beginning a reign that would last for the next six decades and make him one of the most respected rulers in all of Chinese history.

One of the greatest problems facing the young emperor was the need to unify the empire under Manchu rule. To this end Kangxi ordered that a military campaign be conducted against the three Chinese generals who had directed the conquest of south and southwest China in the 1650s. These generals—Shang Kexi, Geng Jimao, and Wu Sangui—had earlier been named princes and had their sons married to the daughters of Manchu nobles as recognition of their loyalty to the Qing cause. By the early 1670s, however, Kangxi wanted to remove these generals, who were referred to as the “Three Feudatories” because of the high degree of independence they wielded over southern China. The campaign against these former allies was bitter and bloody, but after eight years of fighting Kangxi subdued the last of the Chinese resistance in the south. The emperor then turned his attention to conquering the island of Taiwan, where a large army under the command of the Zheng family had established itself in 1659. A fleet of three hundred ships, under the command of Admiral Shi Lang, whose father and brothers had been killed in the 1650s by the rebel leader Zheng Chenggong (Koxinga), was assembled to capture the island. In the summer of 1683 Admiral Shi’s fleet dealt the rebels a fatal blow off the coast of Taiwan, and the last remnants of Chinese resistance surrendered.

Kangxi also worked to protect his empire’s northern and western borders against foreign threats. By the late seventeenth century the Russians had conquered most of
Siberia and were exerting pressure along the Amur River in northern Manchuria. Kangxi attempted to remove this threat by laying siege to the Russian military presence at Fort Albazin in the mid-1680s. In 1689, with the assistance of Jesuit missionaries who served as translators, representatives of the Qing and Russian empires met at the town of Nerchinsk and signed a peace treaty—the first diplomatic treaty between China and a European nation. In the years that followed Russian embassies traveled to the Qing court at Beijing, and the two nations enjoyed cordial commercial and diplomatic relations.

**Northern Border Stabilized**

Kangxi had been anxious to solve his problems with Russia in order to focus his attention on the greater threat posed by the Eleuth king Galdan in western Mongolia. In 1699 Galdan’s armies invaded the territory of the Khalkhas, a nomadic people who lived in eastern Mongolia. The Khalkhas sought refuge in Inner Mongolia, and in 1691 their princes pledged alliance to Kangxi and accepted Qing suzerainty (dominion). Five years later Galdan’s armies again invaded Khalkha territory, and this time Kangxi himself headed an expedition to end this threat along his northern frontier. In 1697 Galdan’s forces were defeated, and the Eleuth king was forced to commit suicide. The northern border of the Qing empire was now stabilized, and all of the peoples of Outer Mongolia were under Manchu control. In 1720 Qing armies also established control over Tibet.

Domestically Kangxi was a conscientious ruler, and under his administration the empire prospered. He ensured that public works, such as maintenance of the dikes along the Huang He (Yellow River) and the navigability of the Grand Canal, were completed. He personally conducted six tours of the empire during his reign, during which he inspected conservancy projects and the work of his officials. While in Beijing he continued to keep a close watch on the work of the empire’s bureaucracy by reading secret reports compiled by teams of censors who were routinely sent to inspect the work of the officialdom. Having mastered classical Chinese, Kangxi was a great patron of Chinese culture and scholarship, and during his rule he sponsored court painters, imperial porcelain factories, academies of learning, and the compilation of works of philosophy and literature. In an effort to retain the traditions of his nomadic heritage, Kangxi also enjoyed periodic hunting trips with members of the Manchu aristocracy.

Kangxi exhibited great intellectual curiosity, and this was demonstrated by his use of Jesuit missionaries as advisers. Not only were the missionaries used as translators during the negotiations with the Russians at Nerchinsk, but also they were used as cartographers and charged with running the Imperial Board of Astronomy because of their mathematical knowledge and ability to correct the Chinese calendar.
Power Struggle

Kangxi had twenty sons and eight daughters who lived to adult age, but only one of these—the prince Yinreng—was born to the first empress. The young prince was named heir-apparent at a young age and was left to serve as acting ruler when his father was absent from the capital during the military campaign against Galdan and the inspection tours of the south. Yinren, however, proved to have a cruel personality, and after years of reading secret reports documenting the prince’s abusive behavior, Kangxi finally revoked Yinren’s status as heir-apparent in 1708 and ordered him arrested. When Kangxi died in December 1722 he had failed to fulfill an important responsibility by not publicly naming an heir, and, in the power struggle that followed his death, his fourth son took the throne under the reign name “Yongzheng.”

Despite his failure to name an heir, Kangxi is recognized, along with the emperor Qianlong (reigned 1736–1799), as one of the two greatest emperors of the Qing dynasty. The empire’s borders were strengthened by his military campaigns, and China’s economy, culture, and population prospered because of the new stability.

Kao-hsiung, Taiwan’s second-largest city, was founded during the Ming dynasty. The city has Asia’s biggest oil refinery and is of strategic importance because of its naval base.

Kao-hsiung (in Pinyin, Gaoxiong) is Taiwan’s second-largest city. It is situated on the southwestern coast of the island. The city was founded during the Ming dynasty (1368–1644) but was under Dutch occupation from 1624 to 1660. In 1863 Kao-hsiung became a treaty port for trade with the European colonial powers. During the Japanese occupation (1895–1945) of Taiwan, Kao-hsiung was transformed into a major industrial center, and the port sustained heavy damage during World War II. The port was rebuilt, and in the 1970s and 1980s it became Taiwan’s most important seaport, covering an area of 154 square kilometers.

Kao-hsiung has shipyards, steel mills, and other heavy industry, as well as petrochemical plants and Asia’s biggest oil refinery. The city is among the most heavily polluted in Taiwan. The port also has a large fleet of fishing boats, and agricultural products are exported from Kao-hsiung by ship. Kao-hsiung is of strategic importance because of its large naval base. The city enjoys equal status with Taipei and is administered directly by an executive committee (yuan) instead of the Taiwan provincial government. Kao-hsiung has a university and several institutions of higher education and an international airport. The eighth International World Games will be held in Kao-hsiung in 2009 from 16 to 26 July.

Khulubai Khan

Hūbiliè dàhàn 忽必烈大汗
1215–1294  Founder of the Mongol empire

Born into a ruling Mongol family, Khulubai Khan began his career as a minor prince who had been granted land in present-day Inner Mongolia, and therefore always had a direct interest in north China. Years of opposition from his brothers and a seemingly constant struggle for power finally led Khulubai to establish a Mongol empire in China, ending the Song dynasty in 1279.

Khulubai Khan, founder of the Mongolian successor khanate (the state or jurisdiction of a khan [sovereign]) in China, was the second of four sons of Tolui-noyán (c. 1190–c. 1231), who was the youngest son of Mongol conqueror Chinggis Khan (also known as Genghis Khan, reigned 1206–1227). Born on the steppe (vast, usually level and treeless tracts in southeastern Europe or Asia), the last ruler of Mongol China so born, Khulubai began his career as a minor prince with an appanage (a grant of territory) in what is now Inner Mongolia, which gave him a direct interest in Mongol-occupied north China. In 1251, with the ascension of his brother Möngke as khan of the still-unified Mongolian empire (with the house of Tolui as its rulers), Khulubai acquired considerably more importance. He became his brother’s viceroy in China, then a principal commander as Möngke set about conquering the Southern Song dynasty (1127–1279).

During this period Khulubai carefully recruited talent from various quarters, not exclusively Chinese, to build his own coterie of advisors. These allies drew the jealousy of his brother, who removed Khulubai as viceroy and came near to eliminating him. Later, after the sudden death of Möngke while campaigning in 1259, these same advisors helped Khulubai claim succession and build a separatist regime in China.

During the early years Khulubai’s principal opponent was his brother Ariq-boke (d. 1266), whom Khulubai ultimately defeated, but an even more serious opponent emerged in Qaidu (1236–1301), a grandson of Ögödei (reigned 1229–1241), second khan of the unified empire. The struggle with Qaidu, although never threatening Khulubai’s position in China, did prevent him from gaining acceptance as the successor to Möngke and confined Khulubai’s power to China and such areas of Mongolia and Turkistan that he could dominate from a Chinese base.

Forced to make do with what he had, Khulubai built an empire in China, initially in the north, long conquered by the Mongols, then in the south, too, where Khulubai’s armies ended the independent regime of the Song dynasty by 1279. Even before his final victory, Khulubai’s regime had adopted the Chinese dynastic designation “Yuan,” meaning “origin,” drawn from the Book of Changes.

Khulubai’s China, described by the European traveler Marco Polo, was a mix of Mongolian, Chinese, and other cultural influences as Khulubai and his ministers set out to provide a regime that had a little something for everyone,
but the most for the Mongols. At its center was a government that was generally Chinese in nomenclature but behind which the reality was very Mongolian. There was no single capital, but the court moved from place to place in a regular seasonal cycle based on Daidu, today’s Beijing, and Shangdu (Xanadu), Khubilai’s summer playground in Inner Mongolia. At court representatives of so many cultures jostled for influence, speaking not only Chinese and Mongolian but also Persian, various Turkic dialects, and even Old French. Few societies were ever as diverse. Even the food served was drawn from all over Asia, although the preferred banquet dish was a much-modified Mongolian soup.

Kong Xiangxi, as brother-in-law of both Republic of China founder Sun Yat-sen and Nationalist leader Chiang Kai-shek, assumed a number of important official posts. Manipulating the posts as the Minister of Finance and Director of the Bank of China, Kong pocketed the nation's financial resources. This corrupt practice, together with the mismanagement of the economy, resulted in Kong's fall from power.

Born in Taigu, Shanxi Province, into a poor family, Kong Xiangxi attended a U.S.-run missionary school, where he was converted to Christianity. In 1901, with church sponsorship, Kong went to the United States and studied first at Oberlin College and then at Yale University. During his stay Kong met Sun Yat-sen, who later founded the Republic of China (ROC). In 1907 Kong returned home and founded the Ming Yin School and started a business. In 1913 Kong was invited by Sun to stage the Second Revolution, thereby beginning Kong's political career. The revolution failed, and Kong followed Sun to Japan. There Kong met and married Soong Ai-ling in 1914. The next year Sun married Soong Mei-ling, the youngest sister of the Soongs, which consolidated the Kong–Chiang relationship.

In 1915 Kong returned to China and helped Sun's Guomindang (GMD, Chinese Nationalist Party) to compete against the warlords for national power. Because of Kong's Western education and exposure, Kong's role was primarily as liaison officer and diplomat, in which capacity he led a delegation to Moscow to explore Soviet assistance to strengthen the GMD.

After Sun's death in 1925 Kong worked closely with the new GMD leader, Chiang Kai-shek, to compete for national power against the warlords. In addition to acting as liaison, Kong managed finances and sought donations. Two episodes in 1927 secured Kong's access to China's political stage. First, the successful Northern Expedition to unite China ensured Chiang the national leadership. Second, at Kong Xiangxi's arrangement, Chiang married Soong Mei-ling, the youngest sister of the Soongs, which consolidated the Kong–Chiang relationship.

In 1928 the expedition ended, and Chiang was recognized as the only Chinese leader. Kong was entrusted with a number of key positions in the government, making him the wealthiest and most powerful financier in China. Kong was named minister of industry and commerce and director of the China Currency Bank, in which capacities he restructured Chinese financial institutions. In 1933, Kong assumed both of these posts, resigning the ministerial post in 1944 and the Bank of China post a year later on V-J Day (Victory in Japan of World War II). During his tenures Kong was responsible for coordinating national and foreign economic resources at Chiang's proposal and fiscal and monetary policymaking, which contributed much to support Chiang's anti-Chinese Communist and anti-Japanese efforts throughout the 1930s and the first half of the 1940s.
Concurrently Kong held several important political posts and participated in diplomatic affairs, including being president of the GMD government’s Executive Yuan. As V-J Day approached, Kong was forced to retreat from the front stage of politics because of internal and external pressures, the latter coming primarily from the United States, Chiang’s important ally. First, Kong’s wartime economic measures had resulted in hyperinflation. Second, evidence indicated that Kong had manipulated his official positions in accepting bribes and pocketing national resources. In 1944 Kong resigned his ministerial post and his Bank of China post the next year.

When the Chinese Civil War broke out in 1947 Kong went to the United States, although he intended to return to Chiang’s camp. Kong lived in seclusion until October 1962, when Chiang invited him to Taiwan. Kong was again made a member of the GMD Central Committee. In February 1966 Kong returned to the United States for medical treatment and lived in Long Island, New York, until his death.

Never harbor the intent to victimize others; but never let guard down against being victimized.

害人之心不可有，
防人之心不可无

Hài rén zhī xīn bù kě yǒu, fán rén zhī xīn bù kě wú
China and Korea have shared their cultures, languages, and history for millennia. Although China was long the dominant power in East Asia, the disruption of Chinese power in the nineteenth century by European colonial activities, as well as the growth of Japanese power, encouraged greater Korean independence. But that was cut short by Japan's annexation of Korea, and the subsequent partition of the Korean peninsula after 1945.

The Korean Peninsula extends from China's northeastern coast toward Japan. To Korea's east is the Sea of Japan (on Korean maps, Dong Hae or East Sea), and to Korea's west is the Yellow Sea (also known as the East China Sea). The land border between China and the Democratic People's Republic of Korea (North Korea) is defined by two rivers that flow from a dormant volcano known to Koreans as “Paektusan” (White Head Mountain) and to Chinese as “Baitoushan.” The border between China and Korea is marked by the Tumen River (Tumen-gang in Korean), which flows east from the volcano, and the Yalu River (Amnok-gang in Korean), which flows south from the volcano before changing course to the southwest and the Yellow Sea.

Early records, including the Kwanggaet'o stele (a stone slab or pillar used for commemorative purposes) in China, indicate that areas north of the Yalu River were under control of Koreans during the time of the Koguryo kingdom (37 BCE–668 CE) in the fourth century CE.

Ethnology
The Korean people are physically more like northern Chinese and Mongolians, and their language is related to the Altaic languages of that region. Chinese cultural influences and technology, such as the use of bronze and iron, were introduced into Korea during the first millennium BCE. By the third and second century BCE the northern Chinese state of Yen controlled southern Manchuria and the northern part of the Korean peninsula.

The Han Chinese established a colonial capital at Lo-lang, the location of modern P'yongyang, in the late second century BCE. This capital was maintained until 313 BCE. Of note, the Han character that is used to express the name of the river that flows through the city of Seoul and that is used in the Korean name of the country is a different Chinese character from the one used to describe Han Chinese.

Language
Early Koreans had no system of writing, so Chinese characters were used to express ideas. However, these characters did not express the Korean vocabulary well. The use of Chinese pictographs, with the addition of phonetic characters, was called idu. The Korean phonetic alphabet,
Hangul, was not created until the fifteenth century and is attributed to King Sejong the Great (1397–1450), who ruled from 1418 to 1450.

**Historical Relationships**

During the last century BCE and most of the first millennium CE the Korean Peninsula was divided among three kingdoms. During this time, the peninsula was ruled by the Koguryo kingdom (37 BCE–668 CE), which extended from the northern portion of the Korean Peninsula into present China, the Shilla kingdom (57 BCE–935 CE) in the southeastern part of the peninsula, and the Paekche kingdom (18 BCE–663 CE) in the southwest. Under pressure from China’s Tang dynasty (618–907 CE) the Koguryok-dominion was defeated in the seventh century CE. The Shilla kingdom joined with Paekche kingdom to create Unified Shilla (668–935 CE) in opposition to the Chinese conquest of northern Korea, but this northern region gained control of most of the Korean Peninsula (except the regions south of the Tumen and Yalu Rivers) by 935 CE. This unified area became known as “Koryo,” which is the root of the word Korea.

The Koryo kingdom (918–1392) had to accept the tributary state system by force when the Chinese Liao dynasty (contemporary of the Song dynasty 960–1279, but controlled only the border) invaded at the end of the tenth century CE. In the twelfth century, with the founding of the Southern Song dynasty (1127–1279), Koryo became a tributary state to the Southern Song.

In the thirteenth century CE Mongols invaded Manchuria, and Manchurians fled into Korea. Koreans resisted the intrusion, and Korea came to be known as a “hermit kingdom.” Nevertheless, Emperor Ch’ien-Lung (1736–1795) again extended Chinese suzerainty (dominion) over vast regions, including Korea, during his reign.

Over the next few centuries, as European explorers began their intrusion into east Asia, Chinese relations with European countries and even many east Asian countries were handled through the Ministry of Rituals; this arrangement was suitable for countries such as Korea,
which had some cultural and linguistic commonalities with China.

In 1875 the Chinese foreign ministry (Tsungli Yamen) encouraged Korea to open itself to relations with the Japanese, thus sacrificing its own suzerainty over Korea. Insurrections in Korea in the early 1880s prompted China to attempt to reassert its influence in Korea, even as Japanese influence was growing there.

In the twentieth century, after the Japanese surrender in World War II, many Koreans who had fled their homeland remained in Manchuria and joined the People's Self-Defense Army in support of the Communists. During the Korean War the People's Republic of China viewed U.S. involvement in the Korean War as a resurgence of Western imperialism; many of General Douglas MacArthur's statements and actions contributed to this view.

The division of the Korean peninsula after World War II, which resulted in the establishment of the Republic of Korea in the south and the Democratic People's Republic of Korea in the north, has benefited China. Northeast China benefited from economic relations with South Korea, and South Korea became one of China's major trading partners in Asia. Although China has gained little from its trade with North Korea, China has provided nearly one-fourth of all international trade with that country, and has been a major provider of food and fuel to it.

In 2001, the year when China was admitted to the World Trade Organization, South Korea replaced the United States as China's greatest source of foreign direct investment (FDI). After the collapse of the Soviet Union, South Korea's post–Cold War international relations have been based less on reliance on the United States and more on diversification in its relations; China is a player in this diversification.

North Korea benefited from the political competition between the Soviet Union and China during the Cold War, playing one against the other in acquiring support. However, the collapse of the Soviet Union and economic liberalization in China have left North Korea without its biggest benefactors, even as it has remained located between one of east Asia's most successful market-oriented economies (South Korea) and what has become one of the world's greatest export-oriented economies (China).

A Chinese text on the subject of divine reward and punishment, translated into Korean.
The “Commander of Three Armies,” the general of a Ming dynasty force sent to help Korea resist Japanese invasion.

Further Reading

The Korean War was a bloody attempt by the opposing governments of North and South Korea to reunify the divided country by force. China supported North Korea, while the United Nations, led by the United States, supported South Korea.

The Korean War was fought between North Korea and South Korea from 1950 until 1953 as each country attempted to reunify Korea (which had been divided after World War II) under its respective government. North Korea was supported by China, and South Korea was supported by U.S.-led United Nations troops.

On 25 June 1950 North Korean forces crossed the thirty-eighth parallel, which had been established as the border between the two Koreas, and invaded their southern neighbor. At the time of the invasion the People’s Republic of China (PRC) was less than one year old. China’s post–World War II civil war exacerbated its domestic, social, and economic chaos, which had begun in 1937 when Japan had invaded and occupied China’s east coast. The PRC was bolstered by the February 1950 Sino-Soviet Treaty of Friendship. Nonetheless, in June 1950 the PRC was an infant state whose immediate goal, apart from survival, was to recapture Taiwan from the fledgling Chinese Nationalist Party (Kuomintang [KMT]) soldiers and politicians. The PRC was hardly in a position to confront the world’s superpower, but that is what it did.

Kim Il Sung, leader of North Korea, wanted to unify the peninsula and establish a Communist economic structure. However, he was blocked by the Western-backed Syngman Rhee, president of South Korea. Kim Il Sung believed that the southern peasants would support communism and that his invasion would galvanize a grass-roots movement in favor of communism.

One month before the invasion Kim met with Chinese Communist Party (CCP) leader Mao Zedong in Beijing, and Kim told the CCP leadership that Soviet leader Joseph Stalin had approved the plan for a southern advance. Although Mao urged caution, he promised support to North Korea and vowed that China would enter the war should the United States intervene. It is possible that Mao did not know the exact date when Kim would cross into South Korea, but he and the CCP were fully aware of North Korea’s impending actions.

North Korean forces swept south in a blitzkrieg-like push that forced the South Korean and U.S. forces into the southeast area around Pusan. On the day of the invasion the United States called for an emergency meeting of the United Nations Security Council, which passed a resolution calling for the cessation of hostilities and a return to the antebellum border arrangement on the peninsula. Two days later, on 27 June, the United Nations agreed to provide assistance to the retreating South Korean forces.

U.S. president Harry Truman responded to Kim’s invasion by ordering the U.S. Seventh Fleet to patrol the Taiwan Straits. Mao declared that this action demonstrated the true imperialistic colors of the United States.

Through the summer of 1950 North Korean forces advanced and occupied almost the entire peninsula. However, on 15 September, on the peninsula’s western region...
of Inchon, U.S. general Douglas MacArthur, the U.N. commander, and his forces landed and began to push the North Korean army back to its original position, north of the thirty-eighth parallel. The sudden reversal of momentum in the war alarmed Mao. As South Korean and U.S. forces neared the thirty-eighth parallel, China feared that the United States might use Korea as a stepping-stone to China. Mao and the CCP politburo met to discuss the continued advance of U.S. forces. Zhou Enlai communicated to an Indian official that China would intervene should U.S. forces step north of the thirty-eighth parallel.

Caution Outvoted

On 7 October the U.S. First Cavalry Division crossed the thirty-eighth parallel. The next day Mao decided to send an army of Chinese troops called the “Chinese People’s Volunteers” (CPV) across the Yalu River and into the peninsula. This action was taken after weeks of debate among the CCP leadership. Some of the CCP elite, such as Lin Biao and Zhou Enlai, expressed grave concerns about a potential war between the United States and China. They argued that apart from China’s domestic, economic, political, and social crises, the United States was the planet’s greatest power and the only nation with atomic weapons. Furthermore, the People’s Liberation Army (PLA) had just finished fighting a brutal civil war and was in the process of downsizing. Although Mao and the other CCP leaders appreciated these challenges, other considerations outweighed the cautious voices. First was Mao’s earlier promise to Kim. If China did not come to North Korea’s defense, all of Asia would consider China an unreliable ally. Second, some in the CCP believed that a confrontation between the United States and the PRC was inevitable. The three areas where this would most likely take place, according to Mao, were in Korea, Taiwan, and Vietnam. Of the three locations, Mao thought that the Chinese would do best in Korea because of its proximity to China and its favorable terrain. Most importantly, if the United States successfully united Korea with a pro-capitalist government, China would have a 1,000-kilometer-plus border that it would have to defend.
Mao appointed Peng Dehuai, a remarkable military strategist, to lead the CPV army and insisted that the most important element of the initial CPV engagement was that of surprise. MacArthur did not take the Chinese force seriously, and his underestimation of the CPV was, Mao believed, to China's strategic advantage. Indeed, MacArthur was so confident that he stated publicly that he would be completely victorious by Thanksgiving and that U.S. troops would be home by Christmas.

Mao's 8 October 1950 decision to enter the conflict was predicated, in part, on Stalin's commitment to support the CPV invasion with air cover. However, on 10 October Stalin gave notice that the Soviet Union would not supply air cover for the CPV. The Soviet leader feared that if Soviet planes and pilots engaged the U.S. Air Force, the peninsula war would escalate into a third world war.

Various North Korean and PRC leaders felt betrayed by Stalin. Stalin had approved Kim's plan to move south of the thirty-eighth parallel; he had encouraged Mao to send Chinese troops to North Korea's aid. And now that North Korea and the PRC desperately needed the support of the Soviet military, Stalin reneged on his commitments.

Faced with the realities of a demoralized, reeling North Korean army and no Soviet air support, Mao nonetheless pursued an aggressive course of action; he ordered Peng to proceed with the CPV move across the Yalu River.

Truman Reassured

At this same time, on 15 October President Truman met with MacArthur on Wake Island in the Pacific Ocean. The general assured his commander that the Chinese forces were weak and demoralized and that even should the Chinese cross the Yalu River, they did not have sufficient transports to quickly move large numbers of soldiers across the river. MacArthur's impressive Inchon landing and subsequent victories added to his legendary self-confidence, and at Wake he exuded authority and a mistaken omniscient view of the Korean War.

Close to 400,000 CPV troops began crossing the Yalu on 19 October, and six days later at the Unsan-Onjong region the Chinese caught the United Nations Command (UNC) and South Korean forces by surprise. Thousands of U.S. and South Korean soldiers were killed or captured. The news of CPV successes delighted Mao and Stalin. Both leaders encouraged Peng to use these initial victories as momentum to push the enemy forces not only south of the thirty-eighth parallel but also out of Seoul, the south's capital city. Mao also instructed Peng to concentrate on defeating the South Korean forces, which would leave the U.S. forces bereft of indigenous allies and make them appear as imperialist invaders to the local population.

These sideline suggestions and orders began an ominous cycle of frustrations for the Communist leaders. Peng resented Stalin giving suggestions that would expose the CPV to dangerous counterattacks. At one point Peng suggested that if Stalin wanted the CPV to move farther south, then the Soviet leader should send his own troops to the peninsula. Peng even found Mao's orders somewhat unrealistic. Peng was unwilling to throw caution to the wind and carry through with an all-out offensive against the retreating UNC. He was concerned about the possibilities of his army being spread too thin and cut off from needed supplies. MacArthur's successful Inchon landing was still fresh on his mind, and he feared another such powerful counterattack.

Between 19 October and 21 December the CPV launched three offensives against the UNC. Zhou Enlai wanted to combine this military success with a diplomatic victory. On 17 January 1951 Zhou proposed that a multinational conference convene to discuss foreign troop withdrawal from Korea and the return of Taiwan to the PRC.

Zhou's hope for a quick end to the war ended just eight days later when U.S. general Matthew Ridgway followed his military instincts and launched a counterattack against the unprepared CPV, taking the CPV leadership by surprise. Mao ordered Peng to launch a counterattack, and this strategic gamble led to the first major CPV defeat on the peninsula. Both armies dug in, and the skirmishes that followed included alternate victories and defeats for the CPV.

MacArthur Sacked

After UNC victories during the 1951 winter campaign MacArthur publicly stated that the CPV's losses might be just the first phase of the eventual PRC defeat. He noted that China's eastern seaboard might be the next UNC
target and that the United States might bring Kuomintang troops back to the mainland from Taiwan. President Truman viewed MacArthur's unauthorized public statements as needlessly provocative. On 11 April MacArthur was relieved of duty. Several weeks later the CPV, under pressure from Mao, launched its fifth offensive, which resulted in an estimated 100,000 CPV casualties. This military debacle finally convinced Mao that sheer numbers and combat bravery were insufficient against a technologically superior enemy. On 26 May Mao ordered Peng to dig in along the thirty-eighth parallel and to abandon the human wave of attacks against the UNC.

During the summer of 1951 both sides stepped up diplomatic efforts because of the ever-increasing likelihood of a military stalemate on the peninsula. General Ridgway, having replaced MacArthur, proposed a parley at Won-San Harbor. Peng rejected the location but accepted the idea of a face-to-face meeting between the two sides. Mao insisted that the meeting take place at Kaesong, a site near the thirty-eighth parallel. The negotiations were productive, and it became clear to the United States that the real authority in North Korea was Peng, who took his orders directly from Mao.

Two disagreements led to an impasse at the Kaesong talks. The first disagreement was over the suggested border between North and South Korea. The Chinese and the North Koreans insisted on the antebellum border along the thirty-eighth parallel. Ridgway and other U.S. advisors and politicians claimed that a return to the thirty-eighth parallel border would mean that the United States had fought for nothing and that Kim Il Sung would have no consequences for this unprovoked aggression. The United States suggested that the border be located somewhere between the Yalu River and the current location of the UNC troops, which was well north of the thirty-eighth parallel. Mao rejected this suggestion and insisted on a thirty-eighth parallel division.

The second disagreement concerned the exchange of prisoners. The Chinese assumed that the United States would observe the Geneva Convention and that a free exchange of prisoners on all sides would conclude hostilities. However, the United States insisted that all prisoners be afforded an opportunity to choose whether to defect to the enemy or return to their homeland. Many of the CPV and North Korean soldiers were demoralized by their experience during the war, and the United States encouraged the POWs to defect and live with greater freedom in South Korea, Taiwan, or other capitalist-friendly nations.

Compromise Reached

The two sides could not get past these two issues, and so the war continued for the next two years. These years were punctuated by excessively costly victories on both sides; battles resembled the give-and-take of World War I trench warfare.

Several events took place that encouraged Mao and Zhou Enlai to compromise on the POW issue. On the domestic front China was eager to launch its first five-year Soviet-model economic plan. Mao was keen to launch China into a dramatic economic recovery, and this was difficult to achieve given the budget drain of the CPV. Indeed, the PRC was able to keep its army on the Korean battlefields only through Soviet loans. The PRC leaders were also aware of growing CPV morale problems. Inadequate basic supplies translated into summers of hunger and winters of frostbite for the CPV. Furthermore, the North Korean economy was incapable of sustaining a civil war.

The United States was also seeking peace while concomitantly demonstrating its fighting resolve throughout 1952. On 24 October 1952 Secretary of State Dean Acheson
addressed the U.N. General Assembly and stated that the United States would not compromise with regard to POW exchanges. The U.N. suggested that neutral parties tackle the POW problem. The next month an Indian diplomat suggested a compromise whereby every POW could meet with neutral-country diplomats and freely express his or her relocation preference. Zhou Enlai rejected this suggestion, and talks stalled again.

On 5 March 1953 Joseph Stalin died. Two weeks later the Soviet Union’s top officials encouraged Mao to compromise on the POW issue. This softer line coincided with the Soviets’ hope for better relations with the United States. By the end of March Zhou agreed to the proposal that neutral parties could interview POWs who were uncertain about repatriation. This represented a diplomatic defeat for the PRC, but it was difficult to ignore the wishes of the Soviet Union.

On 13 June 1953 the POW compromise was reached, and both sides prepared to exchange prisoners. However, South Korean president Syngman Rhee was unhappy with the agreement and released fifty Chinese prisoners without the prescribed interviews. China responded on 13 July with its last major offensive. Both sides were tired of fighting, and the United States insisted that Rhee had acted on his own and that this would not happen again.

Two weeks later, on 27 July, the signed armistice brought the war to an end. All parties had to compromise. The United States settled for the thirty-eighth parallel border, and the Chinese agreed to a negotiated repatriation of prisoners.

**POWs Repatriated**

The Neutral Nations Repatriation Commission (NNRC), made up of personnel from India, Sweden, Switzerland, Poland, and Czechoslovakia, took custody of all nonrepatriated prisoners to ascertain if the prisoners wanted to return to their home countries. The final numbers were not flattering for the PRC. The UNC returned 75,801 POWS. The CPV returned 12,773 prisoners, of which 3,326 were U.S. POWs. However, 14,227 Chinese prisoners met with the NNRC and expressed their desire to defect from the PRC. On the other side, only twenty-one U.S. POWs defected to the Communist states. U.S. officials claimed that these numbers demonstrated the tyrannical nature of the PRC.

The PRC’s participation in the Korean War was both a blessing and a curse for the embryonic state. On the positive side the Korean War united the Chinese. Mao
preached the gospel of anti-imperialism, economic equality, and human dignity. He and his lieutenants rallied the Chinese around the belief that the United States on the Korean Peninsula represented a century-long continuation of Western imperialism and economic exploitation in East Asia. A national PRC movement entitled “Resist America and Aid Korea” illustrated the Chinese unity that came about because of the war. Further, the Chinese people believed that they had finally stood up against the West. Mao, the son of a peasant, had fought the great United States to a standstill. The CCP and its top officials gained domestic credibility because of the CPV triumphs in Korea. The PRC’s stock also rose at an international level. Despite MacArthur’s claim to the contrary, the PRC and its army were not paper tigers. Peng brilliantly led the CPV against overwhelming odds. The world took notice of the PRC, even if the United States would wait until 1979 to recognize the twentieth century’s most populous country.

However, for all these advantages, the Korean War had dire consequences for the PRC. First and foremost was the human cost. An estimated 3 million people perished during the war, making it, after the two world wars, the third-costliest war in the twentieth century. As many as 1 million Chinese soldiers lost their lives in the war. This loss could never be repaid.

The war also chilled relations between the PRC and the USSR. Some among the PRC leadership accused the Soviet Union of being a merchant of death. They believed that Stalin had pushed China into the war and then used the war to keep China weak. In fact, China had to borrow money from the Soviet Union to fight this war—a debt that would be repaid on the backs of the farmers during the 1959–1961 Great Leap Forward.

For all of China’s global prestige in fighting the United States to a standstill, the Korean War made China an international outlaw. The U.N. condemned Kim Il Sung, and the international forces in Korea fought under the United Nations Command. Although the United States might have used the UNC as an excuse to send thousands of U.S. troops, the CPV was fighting the United Nations. A generation would pass before the PRC could join the U.N.

Finally, the Korean War irrevocably changed the PRC’s plans with regard to Taiwan. Mao intended to re-incorporate the island into the PRC in August 1950. Plans were drawn up, and the United States intimated that it was finished with the Chinese Nationalist Party (Guomindang [GMD]) and its leadership. Truman’s decision to protect Taiwan gave the KMT badly needed protection and aid. Thus, although China found security from Western imperialists on its Korean border, it entered the twenty-first century still unsure of its future with Taiwan.

Current relations between the Koreas and China are relatively good. In fact, political leaders around the world look to China to keep a potentially nuclear-armed North Korea from threatening neighboring states. South Korea and China enjoy cordial relations, but part of this is due to the lingering animosity both feel toward Japan for what Japan did in both countries during World War II.

Kumarajiva

Jiúmóluóshí 鸠摩罗什

344–413 CE Translator of Buddhist works

Kumarajiva translated into Chinese about one hundred Mahayana Buddhist texts written in Prakrit and Sanskrit.

Kumarajiva may be credited with bringing to China the critical texts of Mahayana Buddhism by way of his translation into Chinese of previously unavailable Prakrit and Sanskrit works. Kumarajiva, given his Indian background, bears only one name; it is Sanskrit and means, “a youthful soul,” or “eternally youthful.”

Kumarajiva (344–413 CE) was born in Kucha, in China’s present-day Xinjiang Uygur Autonomous Region. His mother, Jiva, is thought to have been the daughter of the king of Kucha. Kumarajiva’s father is thought to have been from India and to have converted to Buddhism and come to Kucha to participate in its thriving Buddhist community. Scholars do not know what connection Kumarajiva continued to have with his father, although Kumarajiva’s mother had him educated at the local monastery, where he excelled in learning. His mother later took him to Kashmir, where he continued his studies. By the time he was twelve, mother and son relocated to the oasis city of Turfan. There Kumarajiva dedicated himself to the Mahayana doctrine of Buddhism.

Kumarajiva’s learning brought him renown at a young age. The king of Kucha requested that he return to the city of his birth and instruct the royal children. Kumarajiva consented and returned to Kucha, where a newly built monastery awaited him. At this stage of his life he began a rigorous study of the Perfection of Wisdom texts. Many sages and monks came to him to be instructed in the doctrines of the Middle Way. Perhaps at this time his mother, who was now a Buddhist nun, traveled to Kashmir, never to return.

Kucha was attacked by the Chinese in 384, and many of its residents were captured and taken east. Among the captured was Kumarajiva, now forty years old. He probably learned Chinese during his captivity of nearly seventeen years. Thus, when he arrived in the city of Changan in 401, he found company among the Buddhists there. They were eager to learn more about their faith. In this way Kumarajiva came to serve Emperor Yao Xing, whom Kumarajiva began to instruct in Buddhist precepts. Kumarajiva, realizing that Buddhist scriptures in Chinese were scarce, began translating texts that he considered essential to a proper understanding of Mahayana. The task of translation was critical because Prakrit and Sanskrit terms were often difficult to render into Chinese. The normal practice was to use approximations, often drawn from Daoism, which yielded inaccurate and clumsy results.

Therefore, Kumarajiva crafted a Chinese vocabulary that allowed readers immediate access to concepts central to Buddhism, such as the notion of the void and the essential emptiness of the self.

The emperor, to facilitate these translations, founded a school devoted to this undertaking. Many monks from India, Kucha, and central Asia came to learn and to expound. During the next twelve years Kumarajiva rendered into Chinese about one hundred Buddhist texts. He died in Changan.

The Kunlun Mountains are a sparsely populated 2,500-kilometer-long mountain range that constitutes the physical border between Tibet and the Xinjiang Uygur Autonomous Region in Western China. It is crossed by the Qinghai-Tibet railway, the highest in the world.

The Kunlun mountain range is about 2,500 kilometers long and runs southeast to northwest on the northwestern border of the Tibetan Plateau. The mountain range stretches from the Pamir Highlands in central Asia to central China, where it forks out into three ranges: the Altun Shan range, the Arkatag range, and the Hoh Xil (Kekexili) range. The Kunlun range constitutes a physical border between Tibet and the Xinjiang Uygur Autonomous Region and extends into Qinghai Province. The width of the range varies but seldom exceeds 200 kilometers. The height of the mountains varies between 4,000 and 7,000 meters, and in the higher western part, where the range is composed of three parallel ridges, peaks such as Kongur and Muztagata reach more than 7,500 meters. The southern slopes fade into the 1,500-meter lower Tibetan Plateau, while the northern slopes are extremely steep. On the Tibetan-Xinjiang border, the Kunlun range has a glaciated area of about 4,000 square kilometers, and the glacial streams of the northern slopes are important for the oases in the Taklimakan Desert.

Above 3,500 meters the Kunlun range has annual average temperatures below zero, and highs and lows may reach 24˚C and −45˚C, respectively. The climate is dry, with an average precipitation of less than 300 millimeters annually. The mountains consist mostly of snow-covered peaks and areas, with no or sparse vegetation interspersed with marsh and wetland formed by melting ice and overflowing rivers. In spite of the extreme climatic conditions, the region has a prolific wildlife population, with more than two hundred species, including a population of about four thousand antelopes that migrates from the southern Tibetan plateau during the summer to give birth. These are under state protection along with the wild donkey, the wild yak, the brown bear, the snow leopard, and several other species.

The range is thinly populated by pastoral nomads whose economy is based on yak, sheep, goats, and, to a lesser extent, cattle. People do little farming in the region. Gold deposits have been discovered at Kaihungbei in the southeastern part of the Kunlun range. The Golmud-Lhasa section of the Qinghai-Tibet railway, which opened 1 July 2006, passes the eastern section of the Kunlun range through the Tanggula Pass 5,231 meters above sea level. The highest situated railway station in the world is located nearby at 5,072 meters. Active fault zones are located along the central Kunlun mountain area, which experienced an earthquake measuring 7.8 on the Richter scale on 14 November 2001.

Since at least the third century BCE the Kunlun Mountains have been known in Chinese literature as a mythical realm, a paradise in which the legendary Queen Mother...
of the West (Xiwangmu) resided. This realm was the far west where the sun sets but also the place where the Earth meets the sky and thus the axis mundi (turning point of the world) and the place from which people were thought to ascend to immortality. In later Daoist religion the legend of the Queen Mother and her court of immortals in the Western Paradise was greatly expanded.

Bent NIELSEN

**Kunlun**

A poem written in 1935 about Min Mountain, part of the Kunlun Mountain range, by China political leader Mao Zedong.

Now I bid Kunlun:
You needn’t be so high,
Nor need you so many snows.
Could I but lean against the sky and unsheathe my sword
To cleave you into three pieces?
One be sent to Europe,
One be presented to America,
And here in the Orient one remains.
A peaceful world,
And in the whole globe it would be as cold or warm as this is.

Kunqu

Kūnqu 崑曲

Kunqu is a highly classical form of Chinese opera, characterized by an elegant musical and performance style. Favored by the educated elite and the court, kunqu exerted a powerful influence on the history of Chinese theater. The last two centuries saw an overall decline in the performance of kunqu, but it survives to this day, enjoying government and international support.

Kunqu, a regional operastyle, was the dramatic style of the educated elite from the sixteenth to the nineteenth centuries. Its music, delicate and usually in four-four time, is dominated by the large side-blown flute (dizi).

Originally an obscure music form, kunqu was fashioned into a body of elegant song by Wei Liangfu (c. 1502–c.1588), whose disciple Liang Chenyu (1520–c.1593) wrote the first recognized kunqu drama. The initial home of kunqu was Suzhou and nearby Kunshan and Taicang, Jiangsu Province, but it spread widely, in particular to Beijing.

Kunqu spawned a significant literature, illustrated by three outstanding works. One is the love fantasy Peony Pavilion (Mudan ting) by China’s most famous playwright, Tang Xianzu (1550–1616). The Palace of Eternal Youth (Changsheng dian) by Hong Sheng (1645–1704) dramatizes historical events of the mid-eighth century, notably Emperor Xuanzong’s love affair with the famous beauty Yang Guifei. Peach Blossom Fan (Taohua shan) by Kong Shangren (1648–1718), a direct descendant of Confucius, also concerns historical events but in the context of a fictional love story. Because the events took place mainly from 1643 to 1645, within living memory, and portrayed the ruling Manchus negatively, Kong was dismissed from office, and the play never did as well as its masterwork status warranted.

The educated elite often purchased children, whom they trained as actors to form private troupes, some men taking actresses as concubines. The troupes performed for special occasions or for guests, especially during banquets, some mansions even having their own stage. Because the dramas were long, individual scenes were performed. Public professional kunqu troupes also existed, most of them all-male, although brothels could support female troupes. Records indicate that public performances of complete kunqu could last three days and nights.

Early in his reign the Qianlong emperor (1736–1795) set up a body at court to organize drama, mostly kunqu. The actors were initially court eunuchs, but when Qianlong made his first southern visit in 1751 he began to recruit actors from Jiangsu Province. Occasions for court drama included popular festivals or birthdays or weddings in the imperial family.

Kunqu influenced (and was also influenced by) Beijing Opera but declined in competition with this and other regional opera styles. The Taiping Rebellion (1851–1864) devastated the areas in which kunqu was especially popular, and consequently kunqu itself. The twentieth century featured several attempts to revive kunqu, but
modernization and reform processes were inimical to this highly classical drama. In 1921 some enthusiastic amateurs set up a training school, but its impact did not survive the War of Resistance against Japan (1937–1945). The People's Republic of China (founded in 1949) took over kunqu and established troupes and training schools. It gave patronage and encouragement to the greatest of twentieth-century kunqu actors and theorists, Yu Zhenfei (1902–1993), and reformed selected plays to conform to the government's political canons. The Cultural Revolution (1966–1976) put an end to this revival attempt.

The reform period since 1978 has included further efforts to resuscitate kunqu. In May 2001 the United Nations Educational, Scientific, and Cultural Organization (UNESCO) recognized it as a “Masterpiece of the Oral and Intangible Heritage of Humanity.” The Jiangsu Provincial Kunju Troupe (Jiangsu sheng Kunju yuan) was a main leader of performance revivals of classical masterworks, including a revised three-evening version of *Peony Pavilion* performed at the Beijing Music Festival in 2004 and a two-evening version of *Peach Blossom Fan* in 2006.

**From Peony Pavilion**

The first lines from one of the most famous examples of kunqu, *The Peony Pavilion*:

Prologue Speaker:

By busy world rejected, in my own world of retreat I pondered a hundred schemes finding joy in none. Daylong I polished verses for the bowels' torture for the telling of “love, in all life hardest to tell.”

Dawns warmed and twilights shadowed my White Camellia Hall till “with red candle I welcomed friends” — and always “the hills and streams raised high my powers.” Let me only keep faith with the history of this longing, of the road that led through three incarnations to the peony pavilion.

Lacquerware

Lacquerware—objects made of wood, metal, or porcelain to which layers of lacquer have been applied—first developed as an art form in China and dates from about 1600 BCE. Carved lacquer is a uniquely Chinese achievement and is considered lacquer art in its pure form.

Lacquerware refers to wares that are made of wood, metal, or porcelain to which lacquer has been applied. Lacquer is the resin or sap of the lacquer (Rhus verniciflua) or varnish tree, which is native to central and southern China and perhaps to Japan. When lacquer is applied to wood, metal, or porcelain, it gives the ware a smooth, hard, transparent, and shiny surface. People in China and Japan have used true or Far Eastern Asian lacquerware since ancient times.

Artists have used the sap of the lacquer tree as a protective and decorative varnish for both art objects and household objects. Artists apply the lacquer in thin layers on wooden objects or inlay it on metal objects. The lacquer, when solidified, also has been used as a medium for sculpture. Lacquerware, like porcelain, has been much appreciated not only in Asia but also Europe, where people have collected it since the sixteenth and seventeenth centuries. Many lacquerware items were beautifully decorated, and many that were household utensils gave durable, waterproof service in households in Asia, where wood was once plentiful. Wood fashioned into lacquerware was versatile, as shown by the wide range of objects included among the wares.

East Asian lacquer is different from the lacquer that forms the basis of some of the varnishes used in japanning (applying varnish to yield a hard, brilliant finish) of European furniture from the sixteenth century onward. Differences exist in chemical composition and sources: The English resin lac or shellac comes from a substance deposited on trees by certain species of insects.

Two broad categories of lacquer objects exist. In one category the lacquer has been applied largely to protect and to decorate. Therefore, the application of lacquer does not change the form of the objects, such as wooden chairs, that are so decorated. In the second class the objects, such as containers, are made mostly of leather, supported by a nonlacquer core. The core can be wood, hemp cloth, or metal and is encased in a lacquer coating thick enough to modify the form of the object. The lacquer coating gives the object a fleshy, plump shape that can be decorated by carving or by painting and inlaying.

Lacquer objects—including all in the second category and any in the first category in which lacquer forms a considerable part of the decoration—are works of art. Lacquer as an art form developed in China and dates from about 1600 BCE during the Shang dynasty (1766–1045 BCE). Artists created pictorial or surfaced decoration and also carved lacquer. The techniques of qiāngjīn (engraved gold), diāoqì (carved lacquer), and diāotìán (filled in) gradually evolved after the tenth century. Carved lacquer is a uniquely Chinese achievement and is considered lacquer art in its pure form.
Range of Objects

Lacquerware included objects ranging from containers—such as bowls, cups, vases, coffers, and bamboo baskets—to chopsticks, screens, and even suits of leather armor. The lacquer vases produced in Soochow, China, resembled fine porcelain with their carvings on wood stained in coral and lacquered. These objects were crafted for the emperor during the Ch’ien Lung period (1736–1796) of the Qing dynasty (1644–1912) and were among the treasures used in the summer palace. Other types of lacquerware include Japanese ware of black and gold inlaid with silver, gold, and mother-of-pearl. Japanese and Chinese screens of lacquered, gilt, and painted wood are familiar not only in Asian institutions and homes today but also in fine art museums. Often well-known artists or copyists paint these screens by hand.

Modern lacquerware from Korea and Japan is highly finished in appearance when compared with lacquerware made in China and other parts of Southeast Asia. The Straits Chinese or Peranakan society in Southeast Asia reproduced lacquered basketry, originally made in China, to carry special gifts offered to deities in temples or during occasions such as festivals and weddings. Lacquerware objects remain important in most Southeast and East Asian households, although they tend to be more expensive than objects made of plastic or ceramic.

The Lansing-Ishii Agreement of 1917 temporarily guaranteed commercial relations for Americans in China at a time when Japan was challenging U.S. interests with its advances onto the Asian mainland. The agreement symbolized Washington’s and Tokyo’s cooperation during World War I, but was quickly replaced by renewed rivalry when the United States pursued the Open Door policy in opposition to Japan’s quest for empire.

The Lansing-Ishii Agreement (2 November 1917), signed by United States secretary of state Robert Lansing (1864–1928) and Japan’s special envoy Ishii Kikujiro (1865–1945), was the culmination of two months of talks on the American–Japanese rivalry in China and temporarily settled the two nations’ conflict over competing commercial interests. The agreement made several major points: (1) the government of the United States recognized that Japan had special interests in China; (2) the governments of the United States and Japan denied that they planned to infringe in any way on the independence or territorial integrity of China; and (3) both governments would always adhere to the principle of the so-called Open Door or equal opportunity for commerce and industry in China.

The talks which led up to the Lansing-Ishii Agreement took place during World War I (1914–1918), a time when China was in a state of political disintegration. China’s capital, Beijing, was under the control of warlord Duan Jirui, and the remainder of the country was in the hands of either warlords or foreign interests. Although China was an ally of the United States and Japan during the war, it remained weak and subject to imperialist exploitation in the years immediately following the fall of the Qing dynasty (1644–1912). Japanese actions in China during World War I, in particular the presentation of the Twenty-One Demands in January 1915 that pushed the Chinese to submit to widespread economic and political concessions, caused the administration of Woodrow Wilson to seek ways to curb Japanese ambitions in China. Despite the public show of cooperation that the Lansing-Ishii agreement represented, relations between the Washington and Tokyo continued to be tense. Statesmen from both nations acknowledged that their interests in China were in conflict.

The origins of the Lansing-Ishii Agreement lie in the U.S. government’s desire to secure access to trade in China after other great powers, such as Great Britain, France, Germany, Russia, and Japan had already carved out spheres of influence there. From 1899 to 1900, U.S. secretary of state John Hay implemented an “Open Door” concept in China through a series of notes addressed to leaders of the powers involved, which asked them to respect the integrity of China’s government and guarantee access to China’s markets. The Open Door policy would, in theory, provide equal trading opportunities in China for all nationalities. These diplomatic notes were neither binding nor effective, but served as the beginning of a principle adhered to by subsequent U.S. presidents.

By 1908 tensions between the United States and Japan had so deteriorated that rumors of war between the two
nations were heard at the highest levels of the administration of Theodore Roosevelt. Americans feared that Japanese expansion had eclipsed concerns about American competition with European powers in Asia. Additionally, the U.S. government was working to curtail Asian immigration to the United States and, in an ironic contradiction of the Open Door policy, to restrict access to American markets by Chinese and Japanese merchants. The Root-Takahira Agreement of 1908, the terms of which served as a preamble to the Lansing-Ishii Agreement, resolved the conflict temporarily. Both nations pledged to maintain the status quo in Asia, to recognize China’s independence, and to adhere to the Open Door policy. With the Root-Takahira Agreement, the United States also recognized Japan’s annexation of Korea and its movement into Manchuria, while the Japanese agreed to slow emigration to the United States.

World War I brought the U.S.-Japanese rivalry to the forefront once again despite the reality that both nations had become allies in the fight against Germany. Consequently, Viscount Ishii traveled to the United States on a two-month goodwill tour that culminated with an “Exchange of Notes” that formalized the Lansing-Ishii Agreement and outlined the two nations’ commitments to their policies in China. Despite the cordial reception Ishii enjoyed in the United States, tensions between Washington and Tokyo soon resurfaced. In 1923 the Lansing-Ishii Agreement was nullified when the administration of Warren Harding moved to emphasize the Open Door policy. The Lansing-Ishii Agreement postponed a conflict that would continue to intensify until reaching its climax with World War II.

Lao She was the penname of Shu Qingchun, a writer of humorous novels, short stories, and plays that praise the Communist Chinese regime.

Shu Qingchun, who wrote under the pen name Lao She, was one of modern China’s most celebrated humorists; his satirical novels, short stories, and plays are highly appreciated. He is also known for his sympathy for the underprivileged. After graduating from Beijing Teacher’s College in 1924 he went to England, where he taught Mandarin Chinese, studied at the School of Oriental and African Studies, and was inspired by reading the novels of British writer Charles Dickens.

When Lao returned to China in 1930, he had already written three novels and had achieved a reputation as a humorous writer, and he continued to write while teaching. During the War of Resistance against Japan (known outside China as the Second Sino-Japanese War, 1937–1945) he was head of the All-China Anti-Japanese Writers Federation, and in 1946 accepted a cultural grant from the U.S. Department of State. He stayed in the United States for three years, returning to China in 1949 after the founding of the People’s Republic. He participated in a number state- and party-sponsored cultural and organizations. But at the beginning of the Cultural Revolution

From Rickshaw Boy

An excerpt from Lao She’s famous novel, which was produced as a film in China in 1982.

The rickshaw men in Peking form several groups. Those who are young and strong and spring of leg rent good-looking rickshaws and work all day. They take their rickshaws out when they feel like it and they quit when they feel like it. They begin their day by going to wait at rickshaw stands or the residences of the wealthy. They specialize in waiting for a customer who wants a fast trip. They might get a dollar or two just like that if it’s a good job. Having struck it rich they might take the rest of the day off. It doesn’t matter to them—if they haven’t made a deal on how much rent they’ll have to pay to the rickshaw agency. The members of this band of brothers generally have two hopes: either to be hired full time, or to buy a rickshaw. In the latter case it doesn’t make much different if they work for a family full time or get their fares in the streets; the rickshaw is their own.

Compare to the first group to all those who are older, or to all those who, due to their physical condition, are lacking in vigor when they run, or to all those who, because of their families, do not dare waste one day. Most of these men pull almost new rickshaws. Man and rickshaw look equally good so these men can maintain the proper dignity when the time comes to ask for the fare. The men in this group work either all day or on the late after and evening shift. Those who work late, from four p.m. to dawn, do so because they have the stamina for it. They don’t care if it is winter or summer. Of course it takes a lot more attentiveness and skill to work at night than in the daytime; naturally you earn somewhat more money . . . Hsian Tzu, before the events which produced the nickname “Camel,” was a comparatively independent rickshaw man. That is to say, he belonged to that group made up of the young and the strong who also owned their own rickshaws. His rickshaw, his life, everything was in his own hands. He was a top-ranking rickshaw man.

(1966–1976) he was publicly denounced as a counterrevolutionary and tortured; in October 1966 he was either murdered or driven to commit suicide.

By the time of his death, Lao had written more than twenty plays in praise of the Communist Chinese regime. Among his most famous works are the 1938 novel Luo-tuo Xiangzi (Xiangzi the Camel, also known as Rickshaw Boy) and the 1957 play Chaguan (Teahouse). Rickshaw Boy, the story of a peasant who suffers hardship and degradation after a brief period of success as a rickshaw puller in Beijing, became a best-seller in the United States when a bowdlerized English translation, with new characters and a happy ending, was published in 1945. A film of the original version was made in 1982.

Laozi is the name of the foundational text of Daoist philosophy and religion. The name “Laozi” also refers to the supposed author of that text.

Laozi, a book also known as The Way and Its Power (Daodejing, Tao te ching) or The Book of Five-Thousand Characters (because it contains a little more than that number of Chinese characters), refers to the text that set forth in eighty-one poems the principles of Daoist philosophy and religion; its alleged author is also known as Laozi.

Laozi: The Person

Scholars debate the historical authenticity and dates of Laozi the person. The name “Laozi” means “master Lao” or the “old master.” Because the text that bears this name is a composite work, drawing on a variety of sources and sayings, and the classical Chinese language does not clearly distinguish between singular and plural, the word laozi could mean “the old masters.” Sima Qian’s (145–86 BCE) Records of the Grand Historian (c. 99–98 BCE) contains a biography of Laozi, but by that time the identity of Laozi was already in question, and Sima probably put together a “life” of Laozi from conflicting or competing sources. Daoists celebrate anonymity, and the author(s) of the Laozi (Daodejing) appear(s) to have achieved it. The biography proposes that most likely Laozi was Li Er, also known as Li Dan, who was born in Juren village in the state of Chu. An ancient legend, contained in the Records of the Grand Historian, relates a meeting between the Chinese philosopher Confucius (551–479 BCE) and Laozi. Some scholars use that story to date Laozi to the sixth century BCE. Others use the story to argue that Laozi did not exist. Based on textual analysis some scholars date the text and its author(s) to the fourth or third centuries BCE. Some texts, such as The Annals of Lü Buwei and the Zhuangzi, contain sayings attributed to Lao Dan. Because those sayings are similar to passages in the Daodejing, some scholars believe that Lao Dan is Master Lao. One legend relates that Laozi was discouraged and decided to leave China. The border guard, Yin Xi, realized that a wise philosopher was about to depart, so he refused to allow Laozi to pass until Laozi recorded his wisdom. Legend has it that Laozi wrote the Daodejing before heading westward.

The expression laozi also could mean “old boy.” There is an ancient legend that Laozi was born at the age of sixty. His mother’s side opened up, and the old boy entered the world with gray hair and the ability to speak. Laozi began to undergo a process of deification in the early Han dynasty (206 BCE–25 CE), and by the later Han dynasty (25–220 CE) Laozi was considered to be an incarnation of the god Lord Lao (Laojun).

There are conflicting versions of what happened to Laozi after leaving China. Some claim that he returned to China and was buried in his hometown of Juren, which is the modern city of Luyi in Henan Province, where a tomb bearing his name can be found today. Some claim he died in India after teaching the Buddha. Others claim that he is immortal and did not die. Laozi is known as the “hidden sage.”
Laozi: The Book

The book that bears the name Laozi consists of two sections: the Daojing (chapters 1–37) and the Dejing (chapters 38–81). Hence the work is known as the Daodejing. In 1973 at Mawangdui near Zhangsha in Hunan Province, a copy of the text was excavated from a tomb that was sealed in 168 BCE. That copy of the text reverses the order of the two sections, beginning with the Dejing, closing with the Daojing. Some propose that this order is significant by placing emphasis on the power (de) over the abstract Way (dao). In 1993 a copy of part of the Laozi written on bamboo slips was excavated from a tomb at Guodian, Jingmen city in Hubei.

Wang Bi (226–249 CE) wrote the most illuminating philosophical commentary on the Laozi. Before the excavations of the text, the Wang Bi redaction was the oldest, most complete, extant version. Hence, the Wang Bi version is the one translated, and chapter references in this article are to the Wang Bi redaction. One significant difference between the Wang Bi version and the excavated versions is that the older excavated versions do not attack Confucian virtues in the direct manner that the Wang Bi version does. The religious Xianger commentary (late second century CE) is older than Wang Bi’s, but it is not complete. The Heshanggong (Master on the Banks of the Yellow River, c. first–second century CE) commentary offers another religious interpretation of the text as a meditation manual.

The Laozi contains such famous sayings as “repay ill will with beneficence” (ch. 63) and “a journey of a thousand miles begins with the first step” (ch. 64). The text has been translated into many languages and more times into English than the Bible. It is the most important text for early, philosophical, and religious Daoism. The Laozi proposes that the Way (dao) is the cosmic source, generating heaven, Earth, and the myriad things and creatures. The term dao is merely a label for an invisible, spontaneous, effortless process of generation, maintenance, and decay. The Way is empty yet fills all things. It is flexible, soft, avoids friction, and contains complementary opposites. Everything is connected to the Way by its instantiated power (de). People, especially the sage rulers, are urged to follow the spontaneous, effortless, and noncontrolling operations of the Way. People should act by not taking purposeful action (wuwei). They should have no or few desires. They should avoid cunning and technical knowledge. The Laozi encourages people to live simply and to be generous. The text realizes the realities of war and advocates deploying troops when necessary, but it advises that the victor cannot be arrogant about the slaughter. It celebrates the feminine, soft approach. It suggests that people return to the simplicity of a newborn infant or the uncarved block, being authentic and genuine. The text has been used for self-cultivation, meditation, rulership, and, more recently, management insights.

Latin America–China Relations ▶
Prior to the market-oriented reforms launched by Deng Xiaoping in 1978, Chinese presence in Latin America was minimal. Since the beginning of the twenty-first century, however, political, economic, and cultural exchanges between China and Latin America have seen a dramatic rise. China has become the third largest trading partner of Latin America and a significant presence in the region.

Contacts between China and Latin America can be traced back to the 1560s, when Spanish galleons (known as “Manila galleons”) sailed the Pacific Ocean between the Philippine port of Manila and Mexico, then called New Spain. Chinese and other Asian merchants developed a thriving trade with New Spain, exporting mainly silks, porcelains, fabric, and jewelry. China imported from the region such goods as silver, shoes, hats, wine, olive oil, and soap.

From 1847 to 1874 about 225,000 Chinese coolies (Chinese indentured laborers), under eight-year contracts, almost all male, were sent to Cuba (to labor in sugar plantations) and Peru (to work in the deadly guano fields). Chinese immigrants began entering Mexico at exactly the same time the United States enacted Chinese exclusion and Mexico promoted immigration. Numbering over twenty-four thousand, the Chinese became one of the largest immigrant communities in Mexico by 1927. Apart from the Manila galleon trade, early contact between China and Latin America arose from emigration.

From the 1870s to the early twentieth century, the Qing (1644–1912) government of China established diplomatic relations with Peru, Brazil, Mexico, Cuba, and Panama. The diplomatic missions not only helped protect the rights of the indentured laborers from China but also promoted trade between the two regions.

During the pre-Cuban Revolution period no Latin American state recognized China. Chinese involvement in the Korean War and domestic problems meant that less attention could be devoted to low-priority area such as Latin America. China’s history of sponsoring Communist revolution in the developing world alienated a large number of governments in Latin America. The Cuban Revolution in 1959 provided the People’s Republic of China (PRC) an opportunity to break the U.S. policy of “containing China” and to establish its diplomatic links in Latin America. Latin America was seen as a tool that could be used against the U.S. interests. Fidel Castro’s victory in 1959, for example, attracted immediate political support from China. In the 1960s China also voiced support for other Latin American countries’ efforts against the United States. When the United States sent troops to deal with the political crisis in the Dominican Republic in April 1965, PRC leader Mao Zedong denounced the United States in strong terms. Except for Cuba, China made no diplomatic breakthroughs in the Western Hemisphere in the 1960s. By the 1970s most of the trade and cultural exchanges between China and Latin America were concentrated on Cuba. China’s trade with the rest of Latin America was minuscule.
In 1970 Chile, under Salvador Allende, became the first South American country to establish diplomatic relations with the PRC. On 11 September 1973, the Allende administration was overthrown by a military coup. China and Chile maintained their diplomatic relations, although exchanges and contacts between them were limited. After the PRC’s admittance to the United Nations and the U.S.-China rapprochement, Chinese diplomatic representation in Latin America increased, and by 1980 the number of Chinese embassies had risen to twelve. Yet China was not a major aid donor and did not participate in Latin America’s multilateral institutions.

The late 1970s marked a turning point in Sino–Latin American relations. After nearly thirty years of Maoist rule, China embarked on a more pragmatic and outward-looking program of economic development that focused primarily on exports, foreign investment, technology and closer ties with the West. Chinese support for Communist parties, revolutionary movements, and radical governments was disappearing. Normal and often friendly relations are being conducted with many governments in the region. Economic interactions have intensified, and financial, commercial, investment, and technical ties have been formed where, in general, few existed before. A fast-growing overseas Chinese community exists in Latin America, and the overseas Chinese are taking an important role in bridging the business interests of China and countries in which they reside.

China views Latin America as a strategic battlefield in its fight against Taiwan. Latin America has long been a stronghold for Taiwan’s diplomacy. Taiwan maintains diplomatic ties with twelve of the thirty-five countries in the region. Both Taipei (capital of Taiwan) and Beijing have been consistent providers of financial assistance to those countries that maintained official relations. Both have set up trade offices in the countries with which they don’t have a diplomatic relationship, often the first step toward switching recognition.

Before the 1990s Chinese leaders seldom visited Latin America, but in recent years more frequent exchanges of high-level visits have occurred between China and Latin America. Chinese leaders are spending more time visiting and hosting counterparts from Latin American countries to build personal relationships and to discuss cooperation in areas of mutual trust. In addition to state visits, China has increased its participation in regional international
organizations in Latin America and the Caribbean. In 2004 China achieved observer status at the Organization of American States (OAS) and since 1993 has sought to become a full member of the Inter-American Development Bank (IDB).

Meanwhile China increased exchanges with representatives of congressional, military, and nongovernmental organizations in Latin America. Even the Chinese Communist Party has established relations with many political parties in the region. An increasing number of Latin American countries were designated as “tourist destinations,” a status that allows Chinese tour groups to travel to these countries without travel restrictions, thus promoting further bilateral interaction. With booming trade relations China became the number-three user of the Panama Canal, behind only the United States and Japan. In September 2004 China sent a peacekeeping contingent to Haiti, marking Beijing’s first deployment of forces ever in the Western Hemisphere.

China’s trade and investment in Latin America have soared since the late 1990s. In 2006 bilateral trade hit $70 billion, an all-time high, compared with only $7 billion in 2000. China has become second only to the United States as an importer of commodities and goods from Latin America. Enormous changes also took place in the composition of Chinese exports to Latin America. Prior to the 1980s China’s exports to the region were confined to textiles and some raw materials. In recent years, alongside sustained increases in exports of textiles, those of automobiles, tractors, motorcycles, TVs, computers, electrical appliances, and farm machinery rose rapidly. Under the Chinese policy of modernization, imports from Latin America, such as crude oil, copper, tin, bauxite, iron ore, zinc, and manganese, are of prime importance. Latin American agricultural exports of wheat and soybeans are important items for Chinese consumption. In the going-out strategy (acquisition of exploration and operation rights in overseas oil and gas fields) for energy security, Latin America was identified as one of the three major regions (with Russia / Central Asia and the Middle East / Africa) that may become China’s emerging energy suppliers.

China’s growing presence in the manufacturing sector in Latin America presents enormous challenge for countries such as Mexico and Argentina began to levy high antidumping taxes against China in the 1990s. Fierce competition exists between China and Mexico and Central America for the U.S. market as China replaced Mexico and Central America as the biggest exporter of textiles and clothing to the United States.

Chinese investment in Latin America grew rapidly in the early twenty-first century. The cumulative stock of China’s foreign direct investment (FDI) in Latin America was $4.6 billion in 2003. By 2006 the figure had grown to $19.7 billion. That was about half of the country’s total investments abroad that year. Almost 96 percent of that FDI went to tax havens such as the Cayman Islands and the British Virgin Islands. Excluding the tax havens, Chinese FDI in the southwestern hemisphere concentrated most heavily in Brazil ($130 million), followed by Peru, Mexico, Venezuela, and Cuba. Chinese direct investments in Latin America are concentrated in the energy and mining sectors.

China’s most important relationship in the region is with Brazil, with which China shares goals of seeking a leading role in international affairs and constraining U.S. power. China supported Brazil’s bid for permanent membership on the U.N. Security Council. Brazil is China’s largest trade partner in Latin America, and China is Brazil’s third-largest trading partner in the world. The two have teamed up in trade talks to demand better terms for developing countries. In 2006 Brazil’s exports to China totaled $12.9 billion, up from $676 million in 1999. Its trade surplus with China that year stood at $5.5 billion. China and Brazil have been cooperating in the development of satellites for surveying the Earth’s resources. Satellites were launched in 1999 and 2003; agreement has also been reached on the launch of third and fourth satellites. In addition, the two sides have cooperated in energy and infrastructure development and aircraft manufacturing.

In 2005 China signed its first-ever free trade agreement (FTA) with a non-Asian country, Chile. The FTA immediately eliminates tariffs on 92 percent of Chile’s exports to China and 50 percent of the products that China sends to Chile. Bilateral trade, now around $8.8 billion annually, grew 24 percent in 2006, making China Chile’s second-most important trading partner after the United States. Now the world’s largest consumer of copper, China receives about 20 percent of its copper imports from Chile.
China has also placed particular emphasis on its relations with Venezuela, intending to make the country China’s major energy supplier. While on his fourth visit to China in 2006, President Hugo Chávez announced plans for a six-fold increase in sales to China over the next decade. In 2005 Venezuela signed a deal for China to build and launch a satellite for Venezuela in 2008. Chinese-Venezuelan trade was $4.34 billion in 2006, a record level and up 102.5 percent from a year earlier.

China’s relations with Cuba have undergone significant evolution since the late 1980s. The two countries had been adversaries, given Sino-Soviet tensions from the early 1960s until the end of the Cold War. Since the early 1990s the two countries have cooperated closely on many international issues. China supports Cuba’s right to determine its own political system and its protests against U.S. sanctions. In return, Cuba endorses China’s positions on human rights and the Taiwan issue. China promised to invest in a Cuban nickel operation, which could bring millions of dollars to Cuba in taxes and royalties. This investment could boost production in one of Cuba’s most important industries and pump badly needed funds into Cuba’s weak and heavily indebted economy. China emerged as Cuba’s second-largest trading partner, fueled by China’s interest in Cuba’s nickel reserves, the third largest in the world. China is now second only to Venezuela as Cuba’s largest trade partner. Trade between Cuba and China ballooned to $1.8 billion in 2006, double the amount of the previous year, as China rose from fourth to second place among Cuba’s most important trading partners, displacing Spain and Canada.

Latin America has become a vital source of energy, natural resources, and foodstuffs for China. Latin American countries have given increasing priority to their relations with China and view investments by and trade with China in their countries as an alternative to their reliance on the United States. Countries such as Cuba and Venezuela view China as a new ally as they distance themselves from traditional partners such as Europe and the United States and carry out a new, multipolar foreign policy. A vibrant commercial relationship elevates China’s political posture in Latin America. Through a mixture of development aid, trade ties, direct investment, and high-level political exchange, China has developed into a new but increasingly important player in Latin America. In the foreseeable future Chinese influence in Latin America is likely to grow. Yet, to date commercial interaction has been the mainspring of Sino–Latin American relations, and China has moved cautiously from a radical to a more pragmatic approach to achieve its goals in Latin America.

Further Reading

China’s legal system, unlike legal systems of other great early civilizations, never sought divine sanction, nor was the government’s right to administer justice limited by religious authority or an independent judiciary. Administering justice was an important imperial function.

Early in China’s history, society was regulated by the ethical teachings of Confucius (551–479 BCE) and his disciples, which defined proper civilized behavior. In the Confucian worldview, civilized people were expected to observe the proper rites. And yet laws were needed to control people who disregarded or violated acceptable conduct.

Rule of Law

The first comprehensive legal system in China was created by the Qin dynasty (221–206 BCE), which ended feudalism and the Warring States period (475–221 BCE). The Qin legal code was based on Legalist principles of the rule of law. The Legalists were a group of thinkers who emerged during the Warring States period and dominated the Qin state before it unified the Chinese world. The Legalists advocated absolute control by a central authority and were radically opposed to Confucians in nearly every way. They believed that humankind was innately selfish and that society could function only if people recognized that as a fact. Punishment for even small crimes was stern, and no one—not even the prince—was above the law. Many scholars believe that the harshness of the Qin legal system contributed to that dynasty’s short duration.

Series of Codes

The succeeding Han dynasty (202 BCE–220 CE) began with the easing of the harsh provisions of the Qin legal system. Liu Bang (256–195 BCE), founder of the Han dynasty, reportedly said when he entered the capital of the defeated Qin: “Gentlemen, for a long time you have suffered beneath the harsh laws of Qin. Those who criticized the government were wiped out along with their families; those who gathered to talk in private were executed in the public market... I hereby promise you a code of laws consisting of three articles only: One, he who kills anyone shall suffer death; two, he who wounds another or steals shall be punished according to the gravity of the offense; three, for the rest I abolish all the laws of Qin” (de Bary et al. 2000, 233).

But the Confucian scholars who came to dominate the Han administration found that ethical principles were in themselves inadequate for ruling an empire and thus detailed laws were necessary for governance. In time elaborate law codes were enacted and supplemented by voluminous commentaries and case information to guide the judge in procedures and sentencing. The Han code has not survived in its entirety. But the codes of succeeding
dynasties, beginning with the codes of the Sui (581–618 CE) and Tang (618–907 CE) dynasties, were based on the Han code.

The Tang code, promulgated in 653 CE, has survived in its entirety. It contained 501 articles grouped under twelve headings. It became the basis of later Chinese dynastic codes and the Japanese legal code. Subsequent dynasties—including the Song (960–1279), Ming (1368–1644), and Qing (1644–1912)—issued legal codes based on those of its predecessor, with modifications. But whereas the Qin code was absolute, egalitarian, and to be rigidly enforced, the later codes were relativistic and conditional. For example, the sentencing for a murderer would depend on who murdered whom and under what circumstances. Thus the killing of a father by a son, regardless of circumstances, was more severely punished than if the father killed the son. In other words, the law was invoked to support public morality because the killing of a father by a son, regardless of circumstance, was a heinous crime, whereas a father had the right to punish a son for bad behavior. However, the Legalist concept of mutual responsibility by members of the same family or among neighbors continued to be applied.

The Chinese code of the imperial era was primarily penal and administrative. A legal profession did not exist. The magistrate of the county was also its chief judicial official who acted as investigator, prosecutor, jury, and judge. The state had little interest in what is called civil law in modern society. Civil law cases were usually handled by clan and village elders and professional and guild leaders who resolved civil disputes where possible, based on commonly accepted moral principles. Although the magistrates and governors who were required to judge legal disputes were not trained in law, they were expected to be conversant with its major provisions and acquainted with previous case decisions. They were, however, aided by legal advisors and secretaries who specialized in legal issues. The exceptions were the judicial commissioners, who presided over the highest provincial courts, and the experts at the capital who reviewed important cases for the Ministry of Punishment, one of the six ministries of the central government; they were specialists in the law.

In criminal cases the magistrate was allowed to use torture in interrogating both the plaintiff and the accused, usually in the form of beating under prescribed conditions. The accused was usually imprisoned during the court proceedings. Sentences for serious cases were automatically reviewed by tribunals of higher officials, all the way up to the Ministry of Punishment. The review boards determined whether the relevant laws were properly applied and whether the magistrate had been unjust or had acted oppressively. Both parties in a legal dispute were allowed to appeal the decisions of lower courts. Capital cases were reviewed by the emperor under solemn circumstances; some emperors even fasted before reviewing death sentences. The goal of the process was to leave as little discretion as possible in the hands of the officials who had sat in judgment and to ensure that no errors had been committed. Judges who went beyond the legal bounds or whose judgments were erroneous were severely punished.

**Punishment**

Judged by modern standards, the punishments carried out were cruel and harsh. Imprisonment was not part of the regular punishment system. There were several categories of punishment for those judged guilty. The type of punishment varied from one era to another. The most serious offenders were punished by death: decapitation, strangulation, and cutting the offender in two at the waist. Regarding particularly heinous crimes, such as treason, family members could also be put to death to avoid future consequences. The death penalty was sometimes commuted to exile, enslavement, or emasculation, and the condemned were sometimes allowed to commit suicide.

For a less serious crime, the punishment could be exile from home, the distance depending on the degree of the crime. Exile was usually to unpleasant places—the harsh desert or steppe areas in the north or northwest, for example, or the malarial southern regions. Exiles could sometimes take their families with them. Usually they were not required to work but had to report to the local authorities at stipulated intervals to prove that they had not escaped. Offenders could also be sentenced to hard labor for a term of years, usually in state construction projects, in state-run mines, or along the frontiers. Sometimes military service was be substituted for exile.

Other forms of punishment also existed and varied,
depending on the era and the nature and severity of the crime. For example, for certain crimes the convicted person’s punishment was to wear, for a stipulated period, the cangue (a heavy wooden collar worn around the neck, similar to the pillory used in England and early America). The purpose was public shaming of the convict. Tattooing on the face was also used as a punishment as a way to shame the convicted and to prevent him from escaping. Certain crimes were punished during some eras by amputation of the nose, ear, or a limb. Another form of punishment was being beaten with a heavy or light bamboo rod. The size of the rod and the number of strikes depended on the seriousness of the crime. Monetary fines were sometimes accepted in lieu of other punishments. The amount varied, again depending on the era and the seriousness of the crime, and the status and age of the offender.

Amnesties
Amnesties were imperial acts of grace that exempted a person from punishment or reduced the punishment of various classes of criminals. They were announced to commemorate victories in war, as thanksgiving for a new emperor’s accession to the throne, to celebrate a long reign, or some other auspicious occasion. They could be general amnesties or specific amnesties applied only to particular classes of criminals. Amnesties often did not apply to those who had committed the most heinous crimes. More amnesties were granted during the Tang and Song than were granted during the Ming and Qing dynasties. This was probably due to the custom of granting leniency and reducing the punishment originally imposed that was already built into the legal review systems of the Ming and Qing.

Circumstances Affect the Punishment

T’ien Tsung-pao had a five-year-old son... One day during her absence the child dawdled over his meal. His father told him to hurry, but he willfully dropped his bowl and broke it. Tsung-pao was angry and spanked his son, who cried. The boy’s stepmother, afraid that her mother-in-law would be unhappy about this, tried to calm the child. He kept on crying, upon which his stepmother slapped him... [The grandmother] was angry and scolded her son and daughter-in-law. Her son did not dare to argue with her. He begged their neighbor to comfort her. When she went to her room to rest, he went out to buy some wine for her to drink in the evening. His wife did not dare to enter into her mother-in-law’s room. The latter could not overcome her anger and hung herself. The Ministry of Justice considered that the child had deserved the disciplining he received at the hands of his parents and that the disciplining, since it occurred during the grandmother’s absence, could not be considered as having been performed in disobedience of her instructions, and that therefore her suicide could not have been anticipated. The case was held to be excusable and one deserving of pity.

Chinese leaders recognize the value of ethnic minority integration, but have maintained power by appointing ethnic Han to many important positions. Understanding the changing role of minorities in Chinese politics is essential for comprehending China’s transforming political landscape.

The changing role of ethnic minorities in Chinese politics is helping to transform the political landscape. Recent problems in the Tibetan regions of China and in Xinjiang Uyghur Autonomous Region have highlighted the challenges that the Chinese Communist Party (CCP) faces in governing a Han-dominant but multiethnic China. While authorities have recruited and promoted more non-Han leaders in recent years to carry out the state’s policies and to demonstrate affirmative action to the public, they also want to make sure that Han Chinese leaders are firmly in charge. How China handles the “nationalities question” will be a crucial determinant of social stability and economic development in the future.

Ethnic Distribution

Han Chinese account for an estimated 91.5 percent of the total population of the country, or 1.2 billion of the 1.33 billion people in China. In addition to the majority Han, the Chinese government officially recognizes fifty-five other nationalities, or ethnic minorities, numbering approximately 106 million people. Although the ethnic minority population constitutes only 8.5 percent of the population, the geographic area of those political units under the autonomous administration of ethnic minorities accounts for 64 percent of the total area of the country.

These ethnic minorities vary greatly in terms of their population size. Eighteen of them exceed 1 million people: Zhuang, Manchu, Hui, Miao, Uyghur, Tujia, Yi, Mongol, Tibetan, Buyi, Dong, Yao, Korean, Bai, Hani, Kazakh, Li, and Dai. The largest ethnic minority, the Zhuang, had more than 16 million people in 2000 when China conducted its fifth national census. By contrast, the seven smallest ethnic minorities have populations of fewer than 10,000. The smallest ethnic group is the Lhoba, a group that resides in Tibet. This ethnic minority had only 2,965 people in 2000.

The Chinese government’s one-child policy, first adopted in 1979, has not been applied to many ethnic minority groups, which is one reason some groups’ populations are growing. In general, ethnic minority families can have two or even three children. Rural farmers and herdsmen in Tibet face no restrictions in terms of the number of children they can have.

The growth rate of the ethnic minority groups varies widely from one group to another. With the exception of Zhuang and Manchu, all other minority groups had much faster growth rates than those of the Han between 1990 and 2000. The low growth rate of the Zhuang and Manchu is largely due to the fact that they are well integrated into the national community. Many members in these two groups are so intermarried that they have lost their...
distinctive cultural identities. A large number of people in these two groups presumably identify themselves as Han rather than as ethnic minorities.

Although Han Chinese have a relatively lower population growth rate in comparison with most of the ethnic minority groups in the country, the absolute number of Han nonetheless increased by nearly 117 million people between 1990 and 2000. According to one official Chinese source, in three minority autonomous regions (Inner Mongolia, Guangxi, and Ningxia), the number of Han has already surpassed that of the minority groups, while in Xinjiang the Han account for 40 percent of the total population.

### Minority Participation

One strategy for reconciling ethnic tensions in Han-dominant China has been to recruit more ethnic minority elites into the political establishment. Chinese authorities have made a concerted effort in recent years to promote ethnic minority elites to leadership positions. As the ethnic minority population grew rapidly over the last half of the twentieth century, the number of ethnic minority cadres also significantly increased. According to official Chinese sources, the number of ethnic minority cadres at all levels of leadership increased from about 10,000 in 1950 to almost 3 million in 2007. CCP leaders have been explicit about the necessity of recruiting and promoting more ethnic elites into the party-state leadership.

Soon after becoming a member of the Standing Committee of the Chinese Communist Party in 1993, Hu Jintao made a long and important speech at the national conference on the promotion of ethnic minority cadres. Hu argued that recruiting and promoting ethnic minority leaders was a major strategic objective for the People’s Republic of China (PRC), one that would determine whether China could resolve its ethnic problems and whether the Chinese state could achieve long-term sociopolitical stability. Hu particularly emphasized that the CCP should provide more educational and training opportunities as well as leadership experiences for young ethnic minority cadres.

One important development in terms of promoting ethnic minority leaders has been in the realm of legislation. In 2002, for example, China’s National People’s Congress (NPC) revised the Law of Ethnic Minority Autonomous Areas of the People’s Republic of China. The revised law now specifies that the top post of the local government in all ethnic minority autonomous areas should be held by a leader who hails from the same ethnic minority background as the majority of the citizens in that area.

In 2008, for the first time in PRC history, all of the governors of China’s five provincial-level ethnic minority autonomous regions—the Tibet Autonomous Region, the Xinjiang Uygur Autonomous Region, the Inner Mongolia Autonomous Region, the Ningxia Hui Autonomous Region, and the Guangxi Zhuang Autonomous Region—had ethnic minority backgrounds.

However, the CCP has maintained its firm control over these provinces by giving the most important leadership posts—the party secretary positions—to cadres who come from Han Chinese backgrounds. In 2008 none of the party secretary posts in any of the five provincial-level minority autonomous regions were held by an ethnic minority leader.

In 2008 all of the heads of China’s 155 local governments that had status as ethnic minority autonomous areas—including the 5 provincial-level regions (qu 区), 30 prefectures (zhou 州) and 120 counties (xian 县 or qi 旗)—were non-Han ethnic minority leaders. The head of the local government is considered the second-highest-ranking official in a given administrative jurisdiction, second only to the party secretary. Ethnic minority leaders have occupied more seats on this important decision-making body in the reform era than they did during the Mao era.

In the five national congresses held between 1987 and 2007, ethnic minority members usually constituted from about 10 percent to 11 percent, almost double their numbers from the five congresses of earlier periods. Forty ethnic minority leaders serve on the Seventeenth Central Committee of the Communist Party of China (in session from 2007 to 2012) as both full and alternate members. The Hui, Zhuang, Tibetan, Mongolian, and Uygur ethnic groups have the highest representation on the Seventeenth CC, and Tibetan, Mongolian, Hui, Manchu, Miao, and Yi minority groups are well represented among the so-called fifth generation of leaders, those born between 1950 and 1965. Most of them work in the provincial leadership, including four (6.6 percent) full
Leadership—Ethnic Minority

Opportunities Limited

While ethnic leaders have been making political inroads, most of the highest level positions are still reserved for the Han. Since the founding of the PRC in 1949, only three ethnic minority leaders have served on the all-important Politburo, the body of leaders that oversees the CCP. From the Thirteenth Party Congress to the Fifteenth Party Congress, a period of 15 years between 1987 and 2002, no ethnic minorities served on the Politburo. As of yet, no ethnic minority leader has ever risen to membership on the Politburo Standing Committee, the top leadership of the CCP.

In 2008 a Mongolian and former governor of Inner Mongolia was appointed minister of the State Ethnic Affairs Commission. In 2008 three ethnic minority leaders were serving on the State Council, the chief administrative authority of PRC. But among the twenty-eight ministers on the State Council, only one member was from an ethnic minority. Two ethnic minority leaders were serving as vice chairs of the NPC, and five ethnic minority leaders were serving as vice chairs of the Chinese People’s Political Consultative Conference. Only one ethnic minority leader was serving as provincial party secretary in China’s thirty-one provincial-level administrations.

Future Implications

For understandable reasons, the Chinese Communist Party is unwilling to give up its power over personnel appointments, particularly in China’s five ethnic minority autonomous regions. The growing ethnic tensions in Tibet and Xinjiang have led Chinese authorities to conclude that they need to exert tighter control over these regions. This has meant appointing Han Chinese leaders to serve in the most important posts in these administrative units. At the same time, top Chinese leaders have recognized the value of having ethnic minority cadres serve in the party–state elite, both for propaganda purposes as well as to inspire minority peoples to view the system as containing opportunities for their own advancement and, therefore, work within the system rather than against it. Those ethnic minority elites who have been appointed by the CCP Organization Department have usually gone through a great deal of scrutiny to make sure that they are loyal to the Communist regime and will carry out the orders of the party’s national leadership.

As in many other countries, ethnic identity in China is becoming an increasingly important political issue. The demonstrations in Tibet in 2008 and the worldwide protests they helped fuel over the Olympic torch rally suggest that ethnic tensions in China may constitute a major liability for the country’s future stability and territorial integrity. How top Chinese leaders handle ethnic tensions and how effectively they recruit ethnic minorities into the political establishment will be not only crucial determinants of social stability going forward but also major criteria for China’s international image.

What will China's sociopolitical structure and leadership be like in the year 2020? The three most commonly perceived political scenarios range from the emergence of a democratic China; prolonged instability and an evolving social scene; or a resilient, authoritarian regime.

Progressing toward the year 2020, analysts see three possible political scenarios for China in 2020: a nation that will become a stable constitutional democracy; a country that will collapse and be left in a state of prolonged civil war, domestic chaos, and massive human exodus; and, with its combination of a market economy and authoritarian political system, a China that will be very like what it is today but far more institutionalized. But China's political structure is unlikely to develop along a direct, linear trajectory. Which road China ultimately takes will depend on the interplay of current political trends, key players in decision-making roles, and demographic factors.

Democratic China

Changes in society and the political system have the potential to contribute to a Chinese democracy. In the social domain, by 2030 some 300–400 million people are expected to have moved from the countryside to urban areas. The urbanization rate of the country is projected to increase from 39 percent in 2002 to 60 percent by 2020. This resettlement, which will probably represent the largest urbanization drive in human history, will likely be accompanied by an unprecedented rapid rise of the Chinese middle class, projected to be 520 million people by 2025. According to the Chinese government's current strategic plans, by 2020 China is slated to become a well-off society (xiaokang shehui 小康社会). Projections point to per capita income as high as 67,150 yuan ($9,800) in 2020, depending on economic conditions. (China's per capita income in 2008 was estimated at 41,797 yuan, or $6,100.)

The ongoing technology revolution is changing the way in which information and ideas are disseminated. Experts believe that 1 billion Chinese people—approximately 70 percent of the country's population—will be using cell phones by 2020. This number will exceed that of the United States, Europe, and Japan combined. With such unprecedented telecommunication penetration paired with continued technological innovation, no government can effectively control the flow of information. Such a flow of information could lead to independent media that in all likelihood will lead to greater cultural and political pluralism in the country.

Other societal changes include the rise of civil society groups and nongovernmental organizations, which are no longer banned in China; an increase in law school students; and an increase in registered lawyers. Many lawyers and legal professionals devote their careers to protecting the interests of vulnerable social groups. A new Chinese name, lawyers for human rights protection (weiquan lüshi 维权律师), has been recently created to
describe this emerging group. It is reasonable to expect that lawyers will become an even more important political force by 2020. Some will continue to work outside the political establishment to challenge abuses of power while other activist lawyers may become political leaders.

In the political arena in 2020, the so-called fifth-generation leaders—those who were born in the 1950s and early 1960s—will likely rise to the highest levels of the Chinese government. Meanwhile, the Chinese leadership will become increasingly diversified in terms of professional background and political experience. Entrepreneurs will constitute an important part of the governing elite in 2020 as China’s market economy takes hold.

Foreign-educated returnees (haiguipai 海归派) will also compete for high offices. Since the year 2000, about 120,000 Chinese students have gone to study abroad every year. The annual number is expected to increase to 300,000 by 2020. These foreign-trained returnees will contribute to the international diffusion of norms and the spread of democratic ideas in China.

The most important political change occurring in China is a trend toward checks and balances in the leadership. Chinese political leaders are not a monolithic group with the same values, outlooks, and policy preferences. And the ruling party is no longer led by a strongman, like Mao or Deng, but instead consists of two competing elite groups: a so-called populist coalition and a so-called elitist coalition. Chinese leaders have begun using the term inner-party democracy (dangnei minzhu 党内民主) to describe the idea of checks and balances within its leadership. This had led to a kind of bipartisanship in the Chinese Communist Party (CCP), or what could be called a one party–two factions formula.

The elitist group represents the interest of the coastal region and prioritizes economic growth. The populist group often voices the concerns of the inland regions and advocates social justice and social cohesion. These two groups are almost equally powerful, partly because their expertise and leadership skills complement each other. Though competing on certain issues, these groups are willing to cooperate on others. They share goals for the survival of the CCP at home and for China’s rise abroad. This need to cooperate occasionally also makes bipartisanship, with Chinese characteristics, a sustainable proposition for the near future.

This political mechanism, however, will not remain stagnant. It will inevitably make political lobbying more transparent, factional politics more legitimate, and elections more regular and genuine. If so, it is not difficult to imagine that the CCP will split along the lines of an elitist coalition and a populist coalition after about fifteen more years of this inner-party bipartisanship. In 2020 the elections and competition within the CCP may extend to general elections in the country; consequently, the intraparty democracy may well be transformed into a constitutional democracy.

Chaotic China

One of the gravest concerns regarding China’s quest for political democracy is that the transition may be painful and violent and could result in prolonged chaos. The status of prolonged chaos has more to do with the daunting demographic challenges that China will confront in the years to come than with political differences.

Economic disparity has become one of the greatest problems the country faces. Within a generation China has been transformed from one of the most equitable countries in the world, in terms of income distribution, to one of the least equitable. In addition, rampant official corruption, growing rural discontent, environmental degradation, a major health crisis, the absence of a social safety net, and frequent industrial accidents could contribute to social unrest.

The ongoing large-scale urbanization in China is not only creating an urban middle class but also increasing the number of urban poor and unemployed people. Population pressures will be overwhelming as the country’s working-age population reaches 955 million by 2020, compared with 732 million in 1995. China’s economic development cannot generate enough jobs to absorb so many people.

The middle-class lifestyle in the urban areas is likely to make China’s environmental challenges more acute. More money means more cars. More cars will naturally lead to more air pollution. The number of registered motor vehicles in Beijing, for example, was 2.7 million in 2006, and a thousand new cars hit the streets each day.

Nationwide, approximately 300 million people lack access to clean drinking water, and 400 million people live in areas with dangerously high levels of air pollution.
One-third of China’s land has been polluted by acid rain. Some scholars in environmental studies believe that China may need to deal with 20–30 million environmental refugees every year by 2020.

China’s medical and health-service system is woefully inadequate for all but the affluent. Approximately 45 percent of urban residents and 80 percent of the rural population have no medical insurance. Furthermore, China is rapidly becoming an aging society. One study found that the elderly (defined as those over the age of 60) comprise roughly 12 percent of China’s total population, but by 2020 this number is projected to increase to roughly 17 percent, about 243 million people.

There are, of course, other triggering factors, including grand-scale corruption scandals, tensions between the central and local governments, conflicting interests between civilian and military leadership, a global financial crisis that may hit the Chinese middle class particularly hard, ethnic frictions in Xinjiang and Tibet, Chinese xenophobia against foreign companies, military confrontation across the Taiwan Strait or with Japan, and a possible nuclear disaster on the Korean Peninsula. Each of these factors could undermine the stability of the Chinese regime.

Around 2022 the fifth generation of Chinese leaders will likely pass power to the so-called sixth generation of leaders who are mainly from single-child families. The sixth-generation leaders, though cosmopolitan and well educated, are characteristically incapable of dealing with crises. Consequently, a series of snowballing events could take place in 2020: The central government loses its control over provincial administrations, the CCP no longer functions, the military splits, civil war breaks out, hoodlums cause looting all over the country, and a massive Chinese exodus leads migrants to every corner of the world.

Adaptable China

China’s authoritarian system is not stagnant, however; its resiliency and ability to adjust to new environments and to introduce legal, administrative, social, and political reforms make the system sustainable.

Recently proposed new developmental strategies may contribute to the continued growth of the Chinese economy in the 2010s and beyond. These strategies include more balanced regional development, domestic demand-driven growth, technological research and innovation (especially in the areas of biotechnology and nanotechnology), and the overseas expansion of Chinese firms. A more sustainable economic development—and a more equal distribution of resources and wealth in the country—will give the CCP more political capital and thus more legitimacy for its rule.

Meanwhile, the various problems in democratic countries—such as increases in economic disparity, voting corruption, political nepotism, election flaws, inefficiency—will make democracy less appealing to the Chinese people. In the eyes of many, an authoritarian, stable, prosperous China can be a credible political alternative to Western models of democracy.

Some major events—most noticeably the 2008 Olympic Games that were held in Beijing, the 2010 Shanghai World Expo, the possible 2018 FIFA World Cup in China, and the 2020 landing of China’s lunar rover (or even astronauts) on the moon—will further magnify the governing capacity of the ruling party. These developments and hypotheses suggest that by 2020 China will neither have made the transition to democracy nor have become chaotic. Instead, China will remain under the authoritarian rule of a ninety-nine-year-old Chinese Communist Party.

Enigmatic China

Although one political scenario can lead to another, China’s political trajectory will by no means develop along a straight path. The country can embark on one direction without necessarily experiencing another. Despite enormous differences in the three contrasting scenarios—democratization, disintegration, and adaptation—all three of these futures share some factors and trends. Examples include the strong impact of the information and technology revolutions, China’s demographic challenges, cultural and social pluralism, and the continued growth of nationalistic sentiment.

What China’s domestic political landscape will look like in the year 2020 will largely depend on the interplay of current political trends, the new players who have recently emerged, and the demographic factors that will
be important in the future. Yet, like any other country, China’s future can have multiple possibilities. China analysts may not agree on what China’s most likely 2020 scenario will be, but any thoughtful and intelligent forecast about China will perhaps come to the same conclusion: The trajectory of this fast-growing economic powerhouse will have profound implications not only for the millions of Chinese people but also for the world community.

Lee Teng-hui was the first Taiwanese native to lead the government and the Chinese Nationalist Party (Guomindang/Kuomintang) in Taiwan. His leadership brought full democracy to Taiwan. Since 2000 former president Lee has become an outspoken advocate of Taiwanese nationalism.

Born in 1923 when Taiwan was a Japanese colony, Lee Teng-hui attended Christian schools as a boy and then received a Japanese education until 1945, when he returned to Taiwan. In the 1950s Lee was among the first generation of Taiwanese students to undertake graduate studies in the United States. He alternated between studying in the United States and working for the Joint Commission on Rural Reconstruction, a successful joint Chinese Nationalist–U.S. land reform program for Taiwan. Taiwan's land reform stressed legal procedures combined with agricultural improvement projects and economic development. It contrasted sharply to the Communist Party's populist, confiscatory, and often violent land reform on the Chinese mainland.

In 1968 Lee earned a PhD in agricultural economics from Cornell University. Back in Taiwan he emerged as a rising Taiwanese Christian in the Nationalist Party. He served as mayor of Taipei before he was elevated to Taiwan's vice presidency in 1984. Lee's elevation marked acceptance by the mainland Nationalist Party of that fact that its future is tied to Taiwan and needs support from the Taiwanese. When President Chiang Ching-kuo, who did much to further Lee's career, died in 1988, Lee succeeded him. Lee served as president until 2000 and won his last four-year term as the first popularly elected president of Taiwan. Lee's outspoken advocacy of Taiwan's cultural differences from China and his unflinching support for Taiwan's political independence from the Chinese mainland earned him the deep enmity of the Beijing leadership as well as strong criticism in Taiwan.

After stepping down from the presidency Lee Teng-hui has used his stature as Taiwan's senior statesman to advocate even more forcefully for Taiwan nationalism. He has repeatedly spoken of Taiwan's "de facto independence." He opposes reconciliation with the People's Republic of China because he fears that Taiwan would lose its separate government and come under Beijing's control. He was critical of President Chen Shui-bian and the Democratic Progressive Party during their leadership from 2001 to 2008 as well as criticizing the policies of President Ma Ying-jeou and the Nationalist Party since they returned to power in May 2008.

LEE, Ang

Lǐ’Ān 李安

b. 1954  Film director

Best known in the West for films like Sense and Sensibility (1995) and Brokeback Mountain (2005), Ang Lee has directed films in both Chinese and English whose popularity and themes have transcended international boundaries. Both Lee and his films have won Academy Awards and gained critical acclaim for their treatment of sensitive subjects.

Born 23 October 1954 in Pingtung, Taiwan, Ang Lee is the first Asian director to be awarded an Academy Award for best director. His films have increased the international audience for Chinese-language films, while the critical success of his English-language films demonstrates his mastery of the universal art of film. Many of his films explore the encounter between different cultures and between tradition and modernity, while the tragic impossibility of true love is also a common theme.

Lee’s parents moved to Taiwan from mainland China at the end of the Chinese Civil War in 1949. After completing a college degree in Taiwan and serving in the army, Lee came to the United States in 1979 and received a master’s degree in fine arts from New York University. He worked with classmate Spike Lee, and his thesis film project Fine Line (1984) won a prestigious award at NYU.

Lee’s first two films, Pushing Hands (1992) and The Wedding Banquet (1993), both filmed in the United States, were based on stories of Taiwanese Americans; they both focused on the themes of cultural and generational differences. Pushing Hands tells the story of a martial arts teacher who emigrates from Taiwan to live with his son in New York, but then moves out due to differing ideas about family and life. The Wedding Banquet is a comedic family melodrama about a gay Taiwanese immigrant to the United States who plans to hide his true identity from his parents by marrying a woman.

Lee returned to Taiwan to make the comedic but socially discerning film Eat Drink Man Woman (1995) about the strained relationships between a widowed father and his three unmarried daughters in Taipei. After gaining international acclaim, Hollywood recruited Lee to make Sense and Sensibility (1995), which was nominated for seven Academy Awards, and then The Ice Storm (1997) and Ride with the Devil (1999).

Crouching Tiger, Hidden Dragon (2000), which merged the Chinese martial arts genre with a Western-style romance, became the highest grossing foreign film in many countries and won an Academy Award for Best Foreign-Language Film. The film encouraged other leading film directors in China, including Zhang Yimou and Chen Kaige, to market Chinese martial-art fantasies as blockbusters for global consumption.

Lee’s disappointment with his first big-budget Hollywood film, Hulk (2003), was followed by one of his greatest and most controversial cinematic accomplishments to date, Brokeback Mountain (2005). The film reinvented the traditional American film genre of the Western as a compassionate tale about the homosexual relationship between two Wyoming cowboys. It won countless
awards around the globe and earned Lee an Oscar for Best Director.

Lee’s Lust, Caution (2007), based on a short story by celebrated Chinese author Eileen Chang (Zhang Ailing), is set in Shanghai in the 1940s during the Second Sino-Japanese War. The film tells the story of a university student who enters into a relationship with the man she is to seduce in order to facilitate his assassination for collaborating with the Japanese occupiers. Although scenes considered overly erotic or political were edited out, the Chinese government permitted the theatrical release of the film. The uncut version circulated as pirated DVDs and was readily downloadable on the Internet in China. Some mainland Chinese even traveled to Hong Kong to view the uncut version. The difference in these versions generated a debate about the right of mainland Chinese to view “uncensored” films, and ultimately lead actress Tang Wei was reprimanded by the Chinese government for her participation in the film’s erotic scenes.

Ang Lee’s career demonstrates that an ethnic Chinese can break into Hollywood, leaving his mark on the industry to become one of the most celebrated directors throughout the world. His deep understanding of both the Chinese way of life and Western traditions lends a unique aspect to his filmmaking.

Further Reading
Since the third century, China has always consisted of a strong central government. The emperor’s decrees were law, changing only with dynasties, until 1912’s revolution. Throughout the modern era, one concept has remained: the government as a centralized bureaucratic autocracy.

Westerners think about law as a formal system, with such features as contracts, a bench, and bar. Throughout its history some of China’s most prominent thinkers have shown hostility to what Westerners think of as law. Just as Western missionaries took it upon themselves to correct the defective Chinese system of religion, Western jurists have felt impelled to show the Chinese what a proper legal system is. Initially, the Chinese were unimpressed. Eventually, however, succumbed to Western arguments—backed by Western arms—and established a new European-style legal system. But traces of the legal system developed in the Tang dynasty (618–907 CE), which are unlike anything Westerners think of as law, remain.

**Western Legal Perspectives**

Westerners think of a legal system primarily as a social institution within which persons (individuals, groups of individuals, or even the state) can make claims against other persons and have these resolved by a neutral judge of fact and law: the court. Normally, persons are represented by lawyers. Westerners also tend to think that the laws applied by the courts will deal with private law, torts, contracts, property, and the like. An organized bar, judicial independence, separation of powers, and some judicial review of administrative acts are also institutions that Westerners expect. These are all aspects of a familiar legal system. They reflect the point of view of law formed by Roman law.

In the fourth century BCE, when Roman law was developing, Rome was a small and predominantly agricultural community with a weak government. The legal problems that Roman law dealt with were the resolution of disputes between private individuals that arose out of torts, simple contracts, and succession. In addition, there were problems of status, both because Roman society was sharply divided (patricians, plebeians, and slaves) and because Romans distinguished themselves from the citizens of other states. Although Roman society soon changed radically, the focus of Roman law had been set.

By the second century CE, Rome was enormous and headed by an emperor whose status and power were unequalled. Nevertheless, civil law, the basic law of the empire, continued to look at society from the point of view of individuals, and its basic concerns were those of individuals.

Civil law remains at the heart of Western law. Western jurists use a model of the universe composed of discrete entities—persons—who create legal obligations by the exercise of their individual wills. They also assume that these persons can get their disputes resolved by professionally trained judges. These persons are no longer human beings but the central figures of the legal system.
They are sometimes called rights bearers. Even the state can appear as a person in a domestic lawsuit. States are the persons of public international law, whose terminology and structure are based on Roman private law.

**Traditional Chinese Law and Codes**

From the Chinese point of view, the central element of their legal system was a body of rules promulgated by the emperor. The system of government that developed in China after its unification in the third century consisted of a strong central government headed by the emperor, who ruled through a highly centralized bureaucracy. The emperor’s power was absolute. There was no doctrine of separation of powers.

The collection of rules is called a code. Each dynasty had its own code—for example, the Great Ming Code, the Qing Code—according to the name of the dynasty. Since the formal legal system was an integral part of the governing apparatus of the empire, when the empire collapsed in the early part of the twentieth century, the legal system disappeared along with everything else. Before that, there is clear continuity from the Tang dynasty to the end of the Qing (1912), and, most likely, the tradition stretches back many centuries before the Tang.

During most of the period for which there is a clear documented tradition (653–1911), the Chinese legal system governed a territory and a population that was greater than that governed by Roman law. In addition to governing China itself, China’s legal system formed the basis of the formal legal systems of nations subject to its influence, most notably Korea, Japan, and Vietnam. It was only when Roman law spread beyond Europe that it began to exceed Chinese law in scope.

In addition to the codes themselves, there were annotations to the codes and many other collections of statutes.
and regulations still in effect. There were also thousands of decisions in cases that arose under the codes, in addition to studies of customary law in which elements of what we would call family and commercial law can be found.

It is best to regard the code as a treatise of sorts, but not in the sense of Western law. The Qing Code, the final code in the tradition, is the product of a great deal of thought. The rules show much refinement. There are many cross-references. It comes close to constituting a scientific analysis of what the Chinese regarded as law. It is not just a compendium of rules, and the rules themselves have been refined and harmonized to a considerable degree. General principles have been factored out. It is a true code that represents the considered view of some of China’s leading jurists as to how to think about what law is. It showed the way to analyze legal problems and provided methods for applying legal rules to them.

By the end of the Qing dynasty, the code was not the direct or immediate basis of decision for most cases (although it contains detailed rules). Rather, the cited authority would most likely have been a li, a set of detailed rules normally based on decisions or interpretations by officials at the highest level of the central government. They were printed following the article of the code to which they referred.

If there was an applicable li, or statute, it was applied instead of the statute. In addition, there were a number of statutes and regulations outside the code. This is also the case in Western law. Precedent plays an enormous role, as do the opinions of eminent authorities and, on occasion, other statutes and regulations. Nevertheless, the code remains at the heart of the system, and serves as the basis for organizing instruction in civil law. The same holds true for Chinese codes.

The Chinese code was a directive to district magistrates telling them when to punish and precisely what punishment to inflict in any circumstances perceived by the state to be legally significant; that is, as injurious to the emperor. District magistrates, the lowest ranking officials who represented the central government, were the emperor in miniature. They exercised all the powers of the state in many functions, including collecting taxes, providing for defense, carrying on public works, conducting

religious ceremonies, supervising examinations for entry into the civil service, and deciding cases. Deciding cases was simply one administrative task among many, an aspect of the magistrates’ general charge to keep order. Magistrates adjudicated cases but were not judges in the Western sense.

**Imperial Law**

By the time the legal system was formalized, the primary obligation of every Chinese was to fulfill the duties assigned by the emperor. The law was concerned with the enforcement of imperial policy. All human activities had to be carried on to fit into his scheme for directing society. Consequently, imperial law took note of human activity only as it was perceived to affect imperial policies. Thus many aspects of marriage were dealt with since marriage and the family system were basic to the nation. An institution similar to the English mortgage, the dian, was given considerable space because it was important to know who owned land so that the government could collect taxes on it.

Tang emperor Li Shimin remarked, “The wise emperor governs his officials; he does not govern the people.” The primary focus of imperial law was the regulation of the official activities of bureaucrats, their conduct or their failure to carry out their duties. Such matters have been dealt with in the United States by internal regulations of government offices. But they are not regarded as being part of the American legal system, except on the rare occasions when they are relevant to some action that is being brought in the regular courts, such as a wrongful discharge.

**Judicial Process**

The code was administered by career civil servants who were selected by competitive examinations based on the Chinese classics. Law was not one of the subjects tested. There were no facilities for training jurists, although some magistrates might have picked up some legal knowledge on the job.

The system was not based on the idea of rights and their enforcement. The adversary trial, which Westerners regard as standard, did not exist in connection with enforcing the code. No lawyers represented parties at a trial. Instead, when a magistrate took jurisdiction over a case, he called in all interested parties and interrogated them. If there was significant, real, nontestimonial evidence, such as a corpse, he examined it. Finding the facts was regarded as much more difficult and important than finding the law, something that the magistrate tended anyway to leave to his clerk. The magistrate made a preliminary decision, and it was reviewed in exactly the same way that superior officials would have reviewed a decision to increase the area’s tax assessment, simply a part of the system of bureaucratic control.

The proceeding could be quite dreadful for everyone. All persons concerned, including complainants and witnesses, were usually imprisoned pending conclusion of the matter. Interrogation often involved torture. The least severe punishment, beating, could nevertheless be crippling or even fatal. Despite this, the system seemed to function in a way the government found satisfactory, and it was not so unbearable as to cause the populace to revolt. With minor changes, it survived for many centuries.

**Informal Legal System of Traditional China**

Along with the formal legal system of imperial China, there was also an informal system. For example, though the code did not deal much with contracts or other commercial matters, the Chinese had an active and sophisticated commerce. They had developed devices similar to negotiable instruments and had a number of business arrangements, such as agencies and partnerships. It was possible to get disputes over these matters resolved by magistrates, but the people used other devices, such as mediation by village elders or guild procedures. There were even persons who performed many of the functions of lawyers, such as drafting complaints and appeals. An elaborate body dealt with such matters as tenancy, debts, and family law. The Chinese did not think of such matters as legal.

**Contact with the West**

Everything in China changed following contact with the West in the nineteenth century. Initially, the Chinese government refused to let Europeans enter China
or do business in the country, except in a small area near Guangzhou (Canton). The Europeans insisted on being permitted to trade inside China and carried on a series of wars to achieve their aims. Once they got in, the Europeans did not wish to be subject to Chinese law, which they regarded as barbarous. They forced the Chinese to let them have their own courts for both criminal and civil matters. This principle was called extraterritoriality.

There were certain areas in important Chinese cities, notably Shanghai, that were self-governing foreign enclaves (called foreign concessions); thus in parts of China, foreign legal systems were functioning in place of the Chinese system. This led to a movement to establish a Western-style legal system in China. It was thought that a Western-style system would get rid of extraterritoriality. In addition, some Chinese intellectuals believed that European legal systems were superior.

**Republican Legal System**

This movement accelerated after 1912 when the Guomindang, the Chinese Nationalist Party, came to power. The new government’s institutions were essentially based on those of the United States, modified by Sun Yat-sen to reflect his sense of China’s needs and traditions, as well as by his perception of American progressivism at the time. As the Republican government grew stronger, it attempted to establish a Western-style legal system. In addition to establishing a system of courts, it enacted a series of Western-style codes. These are the so-called Six Laws: the Constitution, the Civil Code, the Criminal Code, the Codes of Civil and Criminal Procedure, and administrative law. The Six Laws served as subject-matter headings under which other laws could be placed. For example, the company law (corporation code) was placed under the heading Civil Code.

About this time Chinese began to study Western law abroad in Europe, North America, and Japan. In Japan Western-style faculties of law were well established, and Western codes had been adopted. Western-style law schools also began to develop in China. Legal education was organized after the European model. Both in the law departments of state universities, such as Nanking Central University, and in private universities, usually Western missionary institutions, Western-style codes were explicated in the European manner, though sometimes according to the American case method. Although a few law schools remained open during the Cultural Revolution, legal education came to a halt until after Mao died and did not revive until 1978 or 1979.

It is difficult to say what the effect of all this legal
activity was. It seems certain that it had no effect on the lives of the vast majority of Chinese who were peasants (over 80 percent). They lived the lives that had always been theirs. Mostly concerned with survival, they arranged their family affairs as they always had, made arrangements with or punished local criminals, and tried to avoid the government and its tax collectors. Since many urban Chinese had got used to a Western legal system because of their dealings with Westerners, and in some cases because they lived under it in the foreign concessions, there was some use of the new Western system in civil as well as criminal matters.

Law in Maoist China

When the war with Japan ended in 1945, the civil war between the Nationalists and the Communists resumed. Reestablishing and strengthening the prewar legal system was a low priority, although a new constitution was promulgated. The Communists won the war in 1949, and one of the first acts of the new People’s Republic of China (PRC) was to repeal all the laws of the old Nationalist government. Gradually, the judges from the old government were purged, and the law professors were either purged or retrained.

This did not mean, however, that there were no laws or law education. Most of the Western-style law schools continued to function through much of the first decade of the PRC. Initially, the same professors taught the same material that had been taught before Communist rule. Within a few years, they were either replaced or reeducated, usually by their former students who were trained in Soviet law by Soviet teachers sent to China, or by Chinese who had studied in the Soviet Union.

Most of the leaders of the new government had little education, and few had studied law. Many of those who had such knowledge survived and remained in China and were used by the new government to help frame the new legal system. They became quite visible after the change in policy that resulted in the formation of a completely different system after 1978.

The China that began on 1 October 1949 had within it two legal traditions that had not been destroyed. One was the concept of law as an aspect of the government of a centralized bureaucratic autocracy. This approach to law was inherent in the system of government that the Communists inherited. The second was the Western concept of law, a system based on individual rights and administered by impartial professional tribunals separated from the administration. This system was overtly rejected by the Communists when they took power, but to the extent that they thought about legal systems, this was what they had in mind. They had adopted the Western definition of a legal system while rejecting the system itself.

There was a new legal system, but it was fragmented and local and did not deal with many of the problems faced by the government of a densely populated area with significant industry and trade and large cities. And, as
always in China, it was not easy to escape the past. To control the entire country, it was felt necessary to adopt the traditional Chinese device of a centralized bureaucracy, with the consequence that many characteristics of the imperial government remained. The whole society was organized to fulfill the purposes of the central government. Individuals were subjects who were to do what they were told so the purposes of the government could be fulfilled. There was no concept of rights or separation of powers. The influence of the past was not limited to the traces of the empire. The Republican period had also left its mark, particularly the Six Laws and the system that enforced them. But the Communists also developed some novel institutions in the base area of laws they continue to use. In addition, they began immediately to enact new legislation.

**Law Based on Ideology**

The important new element that shaped the new institutions and changed the old was the ideology of the Chinese Communist Party. The Chinese call it “Marxism-Leninism, Mao Zedong Thought,” also known in the West as Maoism. Marxism in any form is a very complicated doctrine; therefore, what follows here is basic and generalized.

The most important basic theory is the belief that there are laws that govern human society that are quite as definite and demonstrable as the laws of physics, and that these laws had been discovered through Marx. The life of mankind is a linear process, not a static reality. It is in constant flux. The key to the changes that occur in society is found in the productive forces. As these develop, products in excess of need appear, and some individuals appropriate the product of the work of others. The relations of production further determine the whole range of phenomena to which Marx gives the name *superstructure*. This includes all political institutions, especially the state, all organized religion, political associations, laws and customs, and finally human consciousness expressed in ideas about the world, religious beliefs, forms of artistic creation, and the doctrines of law, politics, philosophy, and morality. Thus legal institutions and legal relations are, in essence, ephemeral. They are elements of the class struggle created by the class that controls the means of production in order to maintain its position. As the class struggle progresses, and a new class takes over, the institutions will change to reflect the desires and needs of the new rulers.

The only real right at this stage is the right—and indeed the duty—of the proletariat and its instrument, the Communist Party, to eliminate the domination of the bourgeoisie and establish the socialist system. Crime is a symptom of a defective society.

Marxism, as the Chinese understood it, affected many changes in attitude toward traditional institutions that caused them to disappear or suffer radical change. At the same time, it provided a sort of glue that kept society together. The governing ideology helped the Chinese to...
form new institutions to replace the old and deal with new conditions. Nowhere was this more evident than in the law. Marxism required the elimination of the old system. At the same time, it provided a conceptual framework for the construction of a new one.

The question of who owns or can own property or how interests in the property are transferred or even the question “what is to be done when A kills B?” are not what the Chinese legal system is about. The legal system is always about benefiting and protecting the interests of the ruling class, as are all other social institutions.

The divisions of bourgeois social analysis—religion, law, education, commerce, and industry—do not necessarily reflect the way a Communist would view the same society. To persist in looking for institutions that Westerners regard as legal is futile. Still less do the divisions Westerners give to law have any meaning. Public law, private law, property, torts, succession, all have no real significance. Even if institutions are given the same names that we use, such as contracts, the meaning will be different.

While it is possible to retain the appearance of a bourgeois legal system—courts, codes, lawyers—in the period of transition to Communism, the system will, in fact, have changed radically. Perhaps the most important thing to change is the notion of permanence. Since every social and governmental institution is simply a device for enforcing the control of the ruling class, none has any independent existence or validity. Due process and all the apparatus of human-rights protection may be preserved or established if the existence of those institutions is perceived by the party to be in the interest of the revolution, but if they do not assist that process, they will not be permitted to exist. Thus it would be possible to have the right to counsel, the right not to be forced to incriminate oneself, and the right of appeal before an independent judiciary. It is possible at any moment to change the rules. If it is regarded as harmful to the revolution to recognize private ownership and the state’s duty to compensate the owner for expropriation, this right will not be recognized, and there will be no compensation. If enforcement of a contract right, such as a right to demand repayment of a loan, is regarded as not useful, the right will not be enforced.

Many of these concepts are embodied in the formal legal system of present-day China. However, they mean little in practice, but it is possible to conceive of a Communist society in which such a system is operative for a significant period. There seem to have been some tentative moves in that direction in China in the late 1980s, but they were brought to a halt by the events in Tiananmen Square in June 1989.

THOUGHT REFORM

The principal technique for achieving and advancing change in thinking on the mass level was the campaign, or movement, (yundong). On an individual level, the technique was thought reform, sometimes called brainwashing. Thought reform must be considered in any treatment of the Chinese legal system during the Maoist years. Both the campaign and thought reform were used to accomplish purposes that Westerners would not recognize as legal—backing national policies, such as opposing the United States and aiding Korea, for instance. But they can also be used to deal with what Westerners regard as legal matters, such as land ownership, marriage, tax collection, and crime. There was an effort to have those accused of crime not merely to confess but also to change their thinking. This policy continued to the end of the Maoist years. Confessions continued to be the rule. Whether they resulted from thought reform or physical coercion or a combination is not clear.

The campaign and individual thought reform were effective, on the whole, and fit the general aim of the party. They were, however, time consuming and not always practical. To accomplish the varying tasks of government, it was much more practical simply to issue orders. Since China was so large, it was also necessary to make use of a bureaucracy to carry out most programs. Orders were issued by a particular ministry and these would be transmitted through subordinate levels to local offices for enforcement.

The precise way this was done is not completely clear. Many of the statutes and regulations, even today, are classified as being for internal use (secret), and are not available to foreigners or even to most Chinese. Those that are generally available consist for the most part of statutes, directives, and regulations of the central government, though there are also many local regulations. There were at least two kinds of statutes: general directives, such as Several Provisions of the State Council Regarding Improvement of the Food Control System, and precise, narrow rules, such as Notification by the Ministry of Posts
and Telecommunications on the Regulations Governing the Time Limits for Refunds on Money Orders and for Making Inquiries About Them. The common feature of all these laws, from those dealing with the most important interests of the state to those concerned with relatively trivial matters, is that they are almost entirely directed toward government officials, not to the public, just as in the days of imperial law. However, the rules of the PRC are much more pervasive since the control of the whole society, especially the economy, is much greater than was that of the imperial government.

**JUDICIAL PROCESS IN THE PRC**

In the early days of the PRC, the system of courts was carried over from the Nationalist period, even though all the laws of that government were repealed. These courts continued to function where they had functioned before, particularly in the large cities. It was necessary to retain not only the courts but also a number of nationalist judges and to recruit new ones from the existing pool of law school graduates, although they were later replaced with loyal party members.

It is not clear just when the old system disappeared, but certainly by the time of the first formal constitution in 1954, the new system had been established. On paper this consisted of a familiar hierarchical court system that went from a people’s court at the local level to the Supreme People’s Court in Beijing with two intermediate appellate courts in between.

One important use of the courts was to serve as the vehicle for the confiscation of foreign assets. Claims were filed against foreign concerns for back taxes, wages unjustly withheld from workers, fines for violation of regulations, and other infractions.

Once all industrial, commercial, and agricultural property was nationalized, there could be no commercial litigation unless the various state enterprises sued...
each other, which seems to have happened quite often. Apparently there was no formalized system of arbitrating disputes among state enterprises as there was in the Soviet Union. But there was some civil litigation between private citizens. The civil suit was usually part of an effort by local party officials to get the parties to settle their differences. Courts were active participants in this process, but judges did not act as independent adjudicators and did not give what Westerners would regard as legal reasons for their actions.

Most treatment of crime, including punishments, was handled by the Security Administration—the police. A trial was the final formal step in an administrative proceeding that took place within the Security Administration. It was usually only a formality whereby a sentence already determined was formally adjudged for the record, although it could be public if such a proceeding was regarded as useful in educating the masses. In any case it simply confirmed a decision that had already been made. This is not to say that local officials acted without supervision or without reference to rules. They were subject to rigorous supervision by their direct superiors as well as by other agencies, particularly the party. They were expected to follow the rules and policy directives of their superiors and to make complete reports and keep accurate records to show they had done so.

The dominant fact about the legal system is that it was and is a part of the political-legal system composed of the Security Administration, the procuracy (a state agency that supervised the observance of the law), and the courts. This made it possible to coordinate both policymaking and its implementation. The Security Administration was much larger than either the procuracy or the courts, and officials in the Security Administration were often transferred laterally to the procuracy or courts, maintaining the subservience of the courts to the police. The overlapping identities of these organizations became even more obvious in the 1960s and was recognized in the 1975 constitution, when the procuracy disappeared.

But even if the courts and procuracy had been equal in power to the Security Administration, the fact that they all worked together as a system shows that there was no concept of judicial independence, no separation of powers. At best there was a separation of functions. Adjudication was seen as one function of government; the police and procuratorial functions were others.

Throughout the 1950s and 1960s there remained a significant group of people who were trained in European law, either in its capitalist or socialist form, who continued to work in the field, at least in an academic way, until the Cultural Revolution. Although their work was not visible, this meant that when, in the late 1970s, there was a change in attitude toward Western institutions and contacts, there was a cadre of jurists able to draft Western-style codes and reopen the Western-style law schools. In the majority of cases, their knowledge was entirely theoretical. They had never actually used the law they taught or studied in the kind of society for which it was designed. Still, they had an awareness of Western concepts and institutions.

During the Cultural Revolution (1966–1976), most traces of a formal legal system disappeared, although there were still courts.

Law after 1979

While traces of the imperial Chinese legal tradition and that of Republican China are present in the legal system of the new regime that arose after 1978, the most obvious influences are those of the Mao years. After Mao died in September 1976, the faction led by Deng Xiaoping prevailed.

Two elements of the policy of the new regime are especially relevant for law. One was the opening to the outside, which meant that China would welcome foreign investment and technology and would increase foreign contacts by means of allowing Chinese to go abroad and foreigners to come to China. This plan required a legal framework that would reassure foreigners of the safety of their dealings with China. The second was the emphasis on the importance of the rule of law. What this meant to the Chinese officials who propounded it is not clear. None of them had any personal experience of a Western legal system, and they certainly did not intend to give up much power. Most of them had suffered during the Cultural Revolution, however, and they seem to have been searching for a more regularized society, one in which people behaved by rules according to established procedures. They apparently wanted at least to reduce the importance of the campaign and to get rid of the doctrine that policy is law.
All institutions associated, however vaguely, with the concept of law were revived or established. Codes of law, law schools, courts, lawyers, and legal publications appeared in vast numbers. The result has been the establishment of something that looks like a Western legal system.

The new legal system that has been established in China on paper since 1978 may eventually become such a system in fact. As Chinese society changes, new institutions will probably emerge that are neither Western nor traditionally Chinese. The village and township enterprises are an example. It is very difficult to fit them into either Western or traditional Chinese concepts of ownership or business organization. One fact remains: Chinese law, past and present, has to be examined on its own terms. Categories of Western law do not work. In China there is simply one body of law.

The ultimate form of the Chinese legal system cannot be predicted. It seems likely that it will continue to look like a Western system but contain the influence of its own traditions in ways hard to foresee. It will almost certainly be significantly different from the legal systems of the West.

Legalism was a school of thought that advocated strict adherence to the law of a single iron-fisted ruler as the only way to combat humankind’s inherent selfishness. Legalists have been frowned on as rigid totalitarians for most of China’s history; nonetheless, they have been very influential on later policymakers.

The Legalist philosophy was based on thinking that emerged during the turbulence of China’s Warring States period (475–221 BCE). The Legalists advocated absolute control by a central authority and were radically opposed to Confucianism in nearly every way. While Confucianists believed that a well-balanced society would result if every person knew his or her place in society, behaved morally, and adhered to an ancient system of rituals, the Legalists were more cynical in their outlook: They believed that humankind was innately selfish and that society could flourish only if people recognized that fact. One long-standing tradition the Legalists bequeathed to China was the idea of the rule of law, which advocated that no one, not even the prince, was above the law.

The principles that would combine to form the Legalist doctrine were aimed at rejuvenating a state by promoting agricultural development and at strengthening military power. But due to the ruthless application of these doctrines by the rulers of the short-lived Qin dynasty (221–206 BCE), which united China into an empire for the first time, Legalism became vilified as a philosophy for centuries to come.

**Fa, Shu, and Shi**

Three groups of thinkers from the Warring States period, with separate but related points of focus, coalesced during the Han dynasty (206 BCE–220 CE) into the single school known as Legalism. (For the purposes of this discussion, the terms Legalist and Legalism are applied to the three groups and their principles as they developed and eventually synthesized.) The thinkers had been known separately as the scholars of fa (law), shu (statecraft), or shi (power of position).

*Shi* can be translated as “power,” or “authority derived from position.” Shen Dao 慎到 (c. 350–275 BCE) was an itinerant scholar who stressed the importance of *shi* for rulers in maintaining their absolute governance over the people. He held that instead of talent and wisdom, power derived from position was what enabled the potent ruler to subdue the masses. He used a metaphor: “If one uses a weak bow, but the arrow is yet carried high, then it is the wind which speeds up the arrow.” In other words, if men of talent are subjugated by worthless men, it is because the latter possess the power derived from their position, not because they are inherently better people. The ruler’s subjects do not dare to disobey him, not because they love him, but because they fear his power.

*Shu*, meaning “statecraft,” or “methods of governing,” was the second point stressed by the Legalists. An early
thinker who stressed shu was Shen Buhai 申不害 (d. 337 BCE), a minister in the state of Han. His works have not survived, but his ideas were influential for later thinkers, namely Han Fei Zi 韓非子 (c. 280–233 BCE), originally a prince of the state of Han but who defected to the state of Qin and later came to epitomize the Legalist school by encompassing many previous lines of thinking into his own.

The ideal ruler, according to Shen Buhai, achieved shu by simultaneously keeping close tabs on his ministers and delegating responsibility to them. In this way the ruler could save his energy for more important matters, such as remaining in power. Han Fei Zi built on the ideas of Shen Buhai, writing that the ruler should wield shu by keeping his methods secret and unfathomable to his inferiors. If his underlings were unable to guess his weaknesses, the ruler would have the advantage.

Fa (law) was perhaps the most important point advocated by the Legalists. Shang Yang 商鞅 (c. 390–338 BCE), an influential minister in the state of Qin, was an early Legalist who advocated strict (but evenly applied) governance by law. He was a reformist of the time who initiated the establishment of new laws for the state of Qin.

The state of Qin had been greatly strengthened by adopting Legalist policies to promote its agricultural production and military power. But it was not until the ruling of the first emperor of Qin, when he had successfully conquered various states and unified the whole empire, that a series of policies adhering to the Legalist doctrine were enacted, including the reorganization of the country into counties and prefectures. Under the new system, power was concentrated in the central administration. The country was divided into forty prefectures, and the assignment of the local officials to their stations was (in theory) decided by ability and merit. In addition, the standardization of weights and measures was implemented, and the rewarding of farmers who cultivated wasteland and the denigration of merchants and scholars (whom Lord Shang thought of as parasites) were practiced. Shang Yang himself came to a bad end: After the crown prince (whose nose was once cut off upon Shang Yang’s orders) came to power upon the death of the king, he ordered Shang Yang to be torn apart by horse-drawn chariots and his entire family executed.

Han Fei Zi—who was born a century after Shang Yang, became an enthusiastic believer and disseminator of Shang’s ideas, and also came to a bad end, being forced to commit suicide in prison—had this to say about the importance of fa:

In his rule of a state, the Sage does not depend on men doing good of themselves, but makes it so that they can do no wrong. Within the frontiers of a state, there are no more than ten people who do good of themselves, whereas if one makes it so that the people can do no wrong, the entire state can be kept peaceful. He who rules a country makes use of the majority and neglects the few, and so does not concern himself with virtue but with law. (From the “The Conspicuous Schools” of “The Treatises of Han Fei Zi,” cited in Liao)

In this way Han Fei (the Zi of the name means “master”) foreshadowed the thinking of Niccolò Machiavelli, who in Italy 1,700 years later wrote about the ideal prince who rules by power rather than by morals.

Legalism versus Confucianism, Daoism, and Mohism

In opposition to Confucianists such as Mencius (372–289 BCE), who insisted on the goodness of human nature and held that the evil behavior of human beings could be rectified by conforming to ancient standards of decorum and ritual, Han Fei and the Legalists believed in the fundamental evilness of human nature. Only by putting people’s collective self-interest to good use could the ideal ruler stay in power.

This also put them in opposition to the two other major schools of thought vying for position at the time. Daoism, a vastly influential school of thought, held that only by keeping to the laws of nature (Dao, “the Way”) would the ideal moral state be reached. Mohism, founded on the teachings of Mo Ti (c. 470–390 BCE), taught the importance of universal love, treating everybody, not just family members (as Confucianists taught), with due respect and love. These schools of thought were not always mutually exclusive, and it must be remembered that the thinkers
themselves did not think of themselves as Legalists. Shen Dao, for instance, is considered both a Daoist and a Legalist, thinking, as he did, that nature was an amoral force to be obeyed. The wise ruler knew how to use this fact to his advantage.

Han Fei was the first to combine the three core ideas of Legalism. He believed that *shi*, *shu*, and *fa* could not be neglected: To make an arrow straight by stretching or to make a wheel round by bending, it is necessary to use external force. According to Han Fei, the external force being used is none other than the power of the ruler: *shi*. Laws and methods are equally indispensable, but without power or authority by which to carry them into practice, the ruler is ineffective.

When there is the ability but not the power (*shi*), even the talented will be unable to rule the evil. Thus, when Yao [who, as an ancient Sage, became an ordinary man, he was unable to govern three persons. This was not because he was unworthy, but because of the lowliness of his position. And when he became the emperor, his order was put into implementation and his prohibition was effective. This was due to the loftiness of his position. (From “Arguing on Shi” in “The Treatises of Han Fei Zi,” cited in Liao)

The core concept of the Legalists was to insist on the importance of a single, unified set of laws applied uniformly. According to Han Fei, ruling the state with laws also meant that once the laws were formulated and put into practice, any doctrine of private individuals objecting to the laws should be taken as heterodoxy (dissent) and be prohibited, because those heterodox doctrines would weaken the efficacy of the laws. There was no possibility of debate or resolution of differences for the Legalists.

Under the Qin regime, the first in Chinese history to adopt a philosophy as a method of governance, dissent became punishable by death under the influence of the Legalists. As Han Fei said: “There can not be words of two men that are equally authoritative, nor can there be two laws that are both the best. Therefore words not in accord with laws and commands must be prohibited.” (From “On Argument” in “The Treatises of Han Fei Zi,” cited in Liao)

Han Fei insisted that since all people acted in their own interests, it should be better to leave them alone in mutual competition. As he saw it, selfishness was what made the system of rewards and punishments both possible and necessary. Therefore, he opposed the equal division of land advocated by Confucius. He said: “Now for the superior to collect from the rich man so as to distribute to the poor home, is to take from the industrious and the economical and give to the wasteful and the lazy. To wish thus to lead the people to increased activity and frugality is impossible.” (From “The Conspicuous Schools” in “The Treatises of Han Fei Zi,” cited in Liao)

He went into further detail:

When a man sells his services as a farmhand, the master will give him good food at the expense of his own family, and pay him money and cloth. This is not because he loves the farmhand. The master says: “In this way, his plough of the ground will go deeper and his sowing of seeds will be more active.” The farmhand, on the other hand, exerts all his skill cultivating the fields. This is not because he loves his master. The farmhand says: “In this way, I shall have good soup, and money and cloth will come easily.” Thus, he expends his strength as if between them there were a bond of love such as that of father and son. Yet their hearts are centered on utility, and they both harbor the idea of serving themselves. (From “Collection of Legendary Stories” in “The Treatises of Han Fei Zi,” cited in Liao)

Han Fei was an advocate of the absolute monarch. The absolute monarch needed the absolute authority of the ruler. Drawing on the ideas of his Legalist-influencing forerunners, Han Fei designed a set of strategies for the feudal ruler to maintain highly concentrated power. Han Fei faced a turbulent society. The traditional society that had been ruled by means of mores and rites was in the process of collapse during the Warring States period. New opportunities opened to the landlords and farmers as well as to a number of merchants. The nobles at various levels either tried hard to keep their existing social status or attempted to get more power, as the original privileges did not matter in a changing society.
The Qin dynasty lasted a mere fourteen years, a victim of peasant uprisings and infighting. Because local officials were frightened to report insurrections, fearing that by doing so they could be accused of criticizing the central government (a potentially fatal error), peasant uprisings spread across the land. The peasantry had been subjected to years of forced labor on various large-scale projects, not to mention the regime’s disastrous economic policies that treated merchants as parasites and executed entire families as criminals. Many of the ideas of the Legalists, however, lived on far beyond the short life of the Qin dynasty, the only dynasty in Chinese history to attempt to govern by Legalist doctrine.

Lenovo (联想 Lianxiang) is the largest producer of personal computers (PCs) in China and the fourth-largest PC manufacturer worldwide behind Dell, Hewlett-Packard, and Acer. The company, which also sells supercomputers and mobile phones, gained worldwide attention in 2004 for its acquisition of IBM’s personal computing business.

Lenovo controls roughly 30 percent of the Chinese PC market and about 7.4 percent of the global market. More than three-quarters of its twenty-five thousand employees are based in China. For the year 2006–2007 Lenovo reported revenues of $14.6 billion. Lenovo’s headquarters is located in Raleigh, North Carolina.

Founded in 1984 by Liu Chuanzhi (b. 1944), Lenovo began as ICT Co., a distributor and service-based provider of information technology (IT) products under the auspices of the Institute of Computer Technology of the Chinese Academy of Sciences. The company started with an initial capital investment of RMB200,000 ($85,900). The company initially focused on installing and testing imported computers and training new users. In 1987 the company expanded into distribution of foreign brands, namely AST and Hewlett-Packard. In 1989 the company was renamed “Legend Group Co.”

Lenovo’s growth in the 1990s received a boost from the then deputy minister of electronics Hu Qili (b. 1929), who told the company’s management that “China should have its own IBM” (Ling 2006, 129). Having received its license to produce PCs in 1991, Lenovo (then Legend) began to manufacture and sell PCs under its own brand. The removal of high import tariffs in 1992 created an opening for multinational firms to gain market share; Lenovo responded with an aggressive strategy that included selling PCs with the latest technology, designing its computers specifically to suit Chinese customers, and competing in price.

Lenovo was listed on the Hong Kong Stock Exchange in 1994. A year later Lenovo produced 105,780 computers, surpassing the production of its rival Great Wall to rank first among Chinese PC makers. Also in 1995 for the first time the company’s investment partners formalized their holdings in writing. The Chinese Academy of Sciences held 20 percent of the company, the academy’s Institute of Computer Technology held 45 percent, and the employees’ shareholder group held 35 percent.

During the 1990s Chinese consumers’ purchasing power increased, but Lenovo faced a difficult market because of both tightening profit margins in the global computer industry and Chinese consumers’ stagnant demand for personal computers. On 15 March 1996, “after countless setbacks, Lenovo’s computers for the first time appeared on the marketplace as a serious contender” (Ling 2006, 241). By lowering its prices substantially, Lenovo successfully challenged multinational competitors for market share. Foreign brands’ market share declined from 73 percent in 1993 to 40 percent in 1996.
Growth Strategy

By 1997 Lenovo had emerged as the most successful domestic computer company in the Chinese market, which itself had grown to be the second-largest personal computer market in Asia after Japan. In 2002 Lenovo initiated a plan to sell its PCs in markets outside of Asia. But Lenovo reassessed its approach after meeting renewed competition within China, and the company’s top management adopted a strategy of growth through mergers and acquisitions. By 2004 Legend had formally changed its logo and English-language name to “Lenovo.”

In 2004 International Business Machines (IBM) and Lenovo reached a deal for the sale of IBM’s PC unit that totaled $1.75 billion and gave IBM an 18 percent stake in Lenovo. Under the agreement Lenovo gained the right to use the IBM brand for five years and to use the ThinkPad trademark as well as to access IBM’s distribution network. The deal vaulted Lenovo from ninth to third place among computer manufacturers worldwide behind Dell and Hewlett-Packard. Under the terms of the merger Lenovo founder Liu Chuanzhi stepped down from his post as Lenovo chief executive officer but held the post of vice chairman of Legend Holdings, Lenovo’s parent company. Yuanqing Yang became chairman of the board, and a U.S. citizen became chief executive.

Mixed Reviews

The sale of IBM’s PC unit to Lenovo was viewed in China as a sign of the country’s arrival in the global economy; some people in the United States, however, expressed caution at the acquisition of a major U.S. brand by a Chinese firm with government ties. The Commission on Foreign Investment in the United States (CFIUS) undertook a multi-agency review to assess potential national security implications of the acquisition. CFIUS eventually approved the acquisition. In 2006 the U.S. Department of State bought sixteen thousand desktop PCs from Lenovo, touching off a public debate that resulted in the department’s decision to keep the Lenovo computers off of its classified network.

Lenovo’s acquisition of IBM’s PC unit has shifted the company’s sources of earnings. Prior to the purchase a majority of Lenovo’s sales occurred inside China, with an estimated 50 percent of sales going to the Chinese government. By comparison, in 2006 Lenovo reported sales of $14 billion total, with less than $4 billion from China. Lenovo’s corporate strategy includes building a supply chain outside China to be as effective as the one inside China and expanding its PC business market share beyond Asia.

The rise of Lenovo and firms from other industrializing countries to corporate multinational status marks a growing trend in international business. “Being newcomers in the global competitive race, these firms have found niches others ignored and have conceived innovative strategies others disdained but that are, in fact, better suited to an interconnected world and volatile new markets” (van Agtmael 2007, 6). Lenovo became the first Chinese company to sponsor the Olympics with its backing of the 2008 Beijing Games. Lenovo’s successful acquisition of a major U.S. brand is also notable compared with the unsuccessful acquisition by China National Offshore Oil Corporation (CNOOC) of the U.S. oil company Unocal in 2005.

A new labor law imposed by the Chinese government in 2007 may have a significant impact on Lenovo’s cost structure. The law sets minimum wage and severance pay for workers and creates open-ended terms of employment for employees who have completed two terms of service.

Nevertheless, at the beginning of 2008, Lenovo launched its IdeaPad notebook computers in the United States, France, Russia, and South Africa. But with the onset of the global financial crisis at the end of the year, Lenovo, as well as other companies in the IT business, faces significant challenges.

Discussions with Lenovo CEO Yang Yuanqing

Here are highlights from a 30-minute interview with Yang at Lenovo's Morrisville headquarters.

**Why Lenovo is losing U.S. market share:** It's not losing ground in its prime market: large U.S. corporations. The problem is that corporate giants have slowed their spending—making the consumer segment, as well as small and mid-sized businesses, more important than ever. Unfortunately for Lenovo, those markets play to the company's weaknesses. Indeed, it only entered the U.S. consumer market last year. "That is why, overall, we lose market share," Yang said.

**The strategy for regaining share:** "Speed is the key," Yang said. "In each function, you should measure what is the previous development cycle. That must be speeded up. What is your shipment time? That must be speeded up. What is your time to prepare a marketing campaign? If previously we have to spend three months, right now I wish we could cut that to just one month or a couple of weeks."

"That's why we have a COO here," Yang added. "He will help me with the daily operations."

**On becoming CEO again:** Although some have interpreted the management shuffle as a demotion for Yang, he said he prefers being in an operational role. Moreover, he said he instigated the return of Liu Chuanzhi as chairman so that he could focus more time on the business and less on the board of directors.

**On acquiring IBM's PC business:** "I think it was the right decision," he said. "If we didn't have this deal, I think Lenovo today would be [in worse shape]. We would only be a local player." Smaller computer companies, he added, are losing market share to the top 5 PC makers.

**The global PC market:** "We are dependent on the overall macro-economy. I believe this year will still be tough. Maybe the overall PC market will be flat or even shrinking. But in some markets, I am... more optimistic, like in China and some emerging markets."

**On his decision to live in the triangle:** "We have a big operation here. I already understand our Chinese business very well. To come here, to live here, will help me to understand not only our global business, but also our team here... I have learned a lot over the past three or four years.

Lhasa, as capital of the Tibet Autonomous Region, is Tibet’s political and religious center. It is the home of the Dalai Lamas, Tibet’s spiritual leaders.

Lhasa, capital of the Tibet Autonomous Region and historically capital of the Tibetan state, is situated in the central region of U-Tsang on the Kyushu River at a height of 3,650 meters.

The name Lha-sa (pronounced Ha-sa) in Tibetan means “divine ground,” and Lhasa has always played a combined religious and political role. The city has had two main phases: Lhasa was established as the capital by the first Buddhist king, Songtsen Gampo (609?–649 ce), in the seventh century ce to house Jowo, the sacred image of Buddha. Using geomancy (divination by means of figures or lines or geographic features), people determined that the heart of Tibet, where the image should be kept, was in an island on a lake on the site of today’s Lhasa. After the demon of the lake was subdued, a temple was built for the statue and called the “Jokhang” (House of the Lord Buddha). The Jokhang is Lhasa’s holiest shrine. The next phase was in the seventeenth century, when Lhasa was reestablished as the capital of the Dalai Lamas, the Tibetan spiritual leaders. The Potala Palace was built on the Marpo-Ri (Red Hill) as the center for the joint religious and secular government of Tibet.

Around the Jokhang is the Barkhor, or circumambulation path, along which pilgrims walk or prostrate themselves. The Norbulingka, the summer palace of the Dalai Lamas, lies to the west. Other sites include the ancient Ramoche temple. The historic monasteries of Ganden, Drepung, and Sera, headquarters of the dominant Yellow Hat sect of the Dalai Lamas, are close to Lhasa and have wielded enormous influence over the city.

Since Chinese rule modern Lhasa has expanded, dwarfing the Tibetan area, large parts of which have been demolished. Lhasa suffered during the Tibetan uprising in 1959 and was extensively damaged in the 1960s during the Cultural Revolution (1966–1976). In the 1980s the Chinese began restoration work, and a Chinese city expanded in the area to house the administration and business. Today the Tibet Heritage Fund has helped to preserve some areas of historic Lhasa around the Barkhor.

Modern Lhasa has been described variously as drab, featureless, or like a bustling frontier town. Under the Chinese plan of modernizing Tibet and developing its economy, small-scale manufacturing, beer brewing, and now...
the Internet have come to the city. Lhasa’s importance as a pilgrimage center for Tibetans and as a tourist destination has allowed it to preserve some of its main features, while the Chinese plan for Tibet has created a completely new city. China has ambitious plans for Lhasa as part of its policy of developing the western regions of the People’s Republic, including building the world’s highest railroad linking Lhasa to the nearest railhead in Qinghai Province.

In March 2008 anti-Chinese riots led to several deaths of both Han Chinese and demonstrators and embarrassed China in its Olympics year.

Li Bai has come to be regarded as a poet par excellence of the Tang dynasty (618–907 CE). Although he achieved a level of fame in early mid-life, his talent was not recognized by the Tang emperor. Li’s poetry can be characterized by his strong passion, his use of powerful rhetorical devices, and the innovative changes he made to traditional verse forms.

Li Bai (also known as Li Bo) is regarded, along with Du Fu (712–770 CE), as one of the leading literary figures to emerge from the Tang dynasty (618–907 CE) golden age of poetry. Li is traditionally called the “poet transcendent,” an appellation that befits his poetic style and characteristics.

The life of Li Bai is legendary. His courtesy name “Tai-bai” (the Chinese term for the planet Venus) was adopted because the planet appeared in his mother’s dream when she was about to give birth to him. (A courtesy name, or zi, is a two-syllable pseudonym that replaced the given name, but was never used in conjunction with the family name, of an educated Chinese man.) Some people suggested that Li was descended from an ethnic minority, but most believe that Li’s grandfather moved the family from the heartland of China to inner Asia and that Li’s father moved to Shu (modern Sichuan Province) when Li was a child. Li regarded Shu as his homeland because he grew up there before leaving at the age of twenty-six.

Li’s worldview was idiosyncratic. On the one hand he was interested in Daoist immortality and was once converted to Daoism, but on the other hand he wished to serve the court, a standard desire of a Confucian gentleman. This synthesis might have come from his wide range of interests since youth in such subjects as Confucian classics, philosophical treatises, swordsmanship, and archery.

Traveling occupied a large part of Li’s life. Leaving Shu as a young man he sailed down the Yangzi (Chang) River and participated in a carefree lifestyle—drinking, meeting celebrities, sharing whatever wealth he could with needy friends—all the while cultivating the persona of a wildly obsessed poet. Later Li Bai journeyed to central-east China. On the recommendation of his Daoist friend Wu Yun (d. 778), Li was appointed at the age of forty-one as a scholar of the Hanlin Academy in the capital Chang’an (modern Xi’an). Li quickly became famous after the poet He Zhizhang (659–744 CE), upon reading Li’s poem “The Road to Shu Is Harsh,” praised him as “a transcendent banished from Heaven” (Meng Qi, 28). But soon afterward Li offended powerful officials and the emperor himself; he was sent away from court and lost his position at the academy. Thereafter, Li wandered from place to place in despair and poverty.

The appeal of Li’s poetry comes from his strong passion, powerful rhetorical devices, and, above all, creativity. Li wrote in traditional poetic forms but made innovative changes, such as special arrangements of verse length, rhythm, tonal pattern, and repetition. Like all traditional writers, Li borrowed extensively from earlier texts, and the most poignant provenance of Li’s diction and imagery
The Poetry of Li Bai

**DRINKING ALONE UNDER THE MOON**

A jug of wine among the flowers . . .
I drink alone; there is no one with me.
Raising my cup, I invite the bright moon.
Together with my shadow, it makes three persons.
Alas, the moon does not know how to drink,
And my shadow follows me thoughtlessly.
But, still, I have these temporary friends.
We shall enjoy ourselves before the spring passes away.
I sing, and the moon cheers me.
I dance, and my shadow joins me.
While I am conscious, we associate happily.
After I am intoxicated, we separate completely.
To seek a friendship without passions
I look up and think of long distance of the Milky Way.

was the Zhuangzi, a book about the life and thoughts of Zhuang Zhou (mid-fourth to late third century BCE), a foundational philosopher of early Daoism. These borrowed elements were often recouched in hyperbolic language, thereby assuming new life in his poetry.

Li’s authorial voice is presented in many guises—as a recluse, a transcendent, a warrior, a homesick traveler, a drinker, the lonely wife missing her absent husband, and even the mythological Peng Bird and Celestial Horse. These personas find their best presentations in his valedictory verse, poetry of the frontier, love songs (mostly in the yuefu [ballad] mode), accounts of historical events with remarks, landscape poetry, poems of personal frustration, and Daoist cantos.

Li’s disappointment over his lack of recognition by the emperor permeates much of his poetry. His idiosyncrasies and perceived lack of success laid the groundwork for a poetic legacy as bright as Venus itself. Li Bai ended his life—according to legend that is perhaps reinforced by the title of one of his most well-known poems, “Drinking Alone under the Moon”—in an attempt to embrace the moon’s reflection on a lake.

Meng Qi . (870s [1986]). *Benshi shi*. In Ding Fubao (Ed.), *Lidai shihua xubian*, (pp. 1–22). Beijing: Zhonghua.

Li Dazhao was one of the founders of the Chinese Communist Party. Under his lead, the party organized a labor movement and cooperated with others, including anti-Communist factions, in an effort to achieve national unification. Li’s other important contribution was his innovative modification of Marxism to suit uniquely Chinese conditions, an adaptation that helped socialism take root in China.

Born in Leting, Hebei Province, to a land-owning family, Li Dazhao acquired a comprehensive understanding of the Chinese peasantry, which later influenced his theoretical innovation in the application of Marxism in China. In 1913 Li went to Japan and enrolled at Waseda University, where he studied political science and began to learn about Marxism. In mid-1916 Li returned to China, participating in the antimonarchical restoration movement against warlord Yuan Shi-kai. In 1918 Li took a job as head librarian at Beijing University, where he learned more about the Russian Bolshevik Revolution of 1917 and encountered Mao Zedong, who later became the leader of Communist China. Meanwhile Li wrote numerous articles to promote modernization and democratization as effective self-strengthening means to fight domestic warlords and foreign imperialists. Some of Li’s articles were published in the journal *New Youth*, whose founder was Chen Duxiu, the other cofounder of the Chinese Communist Party (CCP).

The May Fourth Movement of 1919 turned Li to the Marxist camp. In the September 1919 issue of *New Youth* Li introduced Marxism to his Chinese audience, followed by another article on the Bolshevik Revolution three months later. In both works Li argued that Communism was the only way to save China from foreign imperialism. Li argued that mobilization of the proletariat and violent revolution were essential and justified. Li’s ideas were well received, and numerous Marxist study groups were founded, with Li heading the Beijing branch, Chen the Shanghai branch, and Mao the Changsha branch. Meanwhile Li and Chen explored the idea of forming a Communist party.

With Soviet Comintern assistance, the Chinese Communist Party (CCP) was founded on 1 July 1921, in Shanghai, and Li served on the executive committee in the Beijing area. In 1924, at the Comintern’s instructions, Li led the CCP to join Sun Yat-sen’s Guomindang.
intending to create a united front to protect the growth of the infant CCP. Li was elected to the GMD’s Central Executive Committee, where he gained resources to support his works in north China. This cooperation between the CCP and the GMD was called the “First United Front,” and the primary task was national unification by eliminating warlordism.

During his stay in the north until his death in 1927 Li concentrated on the labor movement and united-front endeavors to accomplish national unification. In the meantime he continued to promote and modify Marxism to fit China’s unique conditions. In 1923 Li published a work entitled Populism, in which he argued that all people are equal and enjoy the same political rights regardless of socioeconomic status. Li also enlarged the Marxist concept of the proletariat by including peasants. Given China’s mass peasantry, Li stressed its potential revolutionary value and urged party members to go to the countryside to recruit and mobilize the peasants. Li also formulated a number of military tactics and operational strategies, emphasizing the manipulation of China’s vast rural hinterland. All these strategies had direct bearings on Mao, whose final accession to power in 1949 was to a large extent due to the tailor-made tactics and strategies to suit Chinese conditions that Li had formulated two decades earlier. By the same token, this Chinese variant of Communism was accountable for the tense relationship between the Chinese Communists and the Soviet Union from time to time.

Li’s overt antiwarlordism, however, had irritated Zhang Zuolin, who at the height of Li’s revolutionary activities in the mid-1920s, controlled the Beijing government. In 1926 Li’s activities were driven underground when Zhang ordered his arrest. Li found refuge in the Soviet Embassy. Gaining foreign acquiescence, Zhang’s army marched into the Beijing Legation and raided the Soviet Embassy. Li was arrested on 6 April 1927, and executed on 28 April 1927.

Li Hongzhang was one of China’s most influential officials during the late nineteenth century. As the Qing dynasty (1644–1912) struggled to adjust to domestic uprisings and the intrusion of Western nations, Li emerged as the nation’s foremost military leader, diplomat, industrialist, and reformer.

Li Hongzhang was born in Hefei, Anwei (modern Anhui) Province, the second son of a successful landowner and scholar-official. He earned the jinshi degree (in the Chinese civil service examination system, the highest degree a scholar could attain) at the age of only twenty-four and earned an appointment to the prestigious Hanlin Academy in Beijing, where he became the protégé of an eminent official, Zeng Guofan. In 1853 Li returned to his hometown to help his father establish a local militia to defend the region against Nian rebels. Five years later he left Anwei for Jiangxi Province to join Zeng and his powerful Hunan (Xiang) Army in combating anti-Qing Taiping rebels in southern China. From these auspicious beginnings Li would go on to become one of the Qing dynasty’s (1644–1912) foremost military leaders, a valuable contributor to China’s efforts at self-strengthening in technology and defense, and a renowned diplomat.

In 1861 Li was appointed governor of Jiangsu Province and arrived the next year in Shanghai with his newly organized militia, known as the “Huai Army.” Hand-picked generals and loyal troops made this one of the finest military forces in China. Working in conjunction with Zeng’s army and foreign troops of the Ever Victorious Army, Li was finally able to crush the Taiping Rebellion in 1864. He was rewarded for his military accomplishments with an appointment as imperial commissioner to suppress the Nian Rebellion and promotion to governor-general of Hunan and Hubei provinces. After a difficult campaign against the Nian rebels in Anwei Province, Li finally brought the uprising to an end in August 1868. For his success in pacifying the region, Li was awarded the honorific title of Grand Guardian of the Heir Apparent.

Foreign Diplomacy

In response to the Tianjin Massacre of 21 June 1870, in which a French consul and eighteen other foreigners, including ten Catholic nuns, were killed by a Chinese mob, Li marched his Huai Army to Tianjin as a show of force. En route he was reassigned as governor-general of Zhili Province, replacing his ailing mentor, Zeng Guofan, in this politically sensitive post. During his twenty-five-year tenure in Zhili, Li became China’s chief negotiator of critical issues with foreign powers. In 1876 he concluded the Chefoo Convention with Great Britain, regulating trade along China’s border with Burma (Myanmar). In 1883 he defused a tense situation in Korea between Chinese and Japanese troops but that same year was unable to prevent French advances in Vietnam. The subsequent Sino-French war (1884–1885) resulted in the near-total destruction of China’s southern fleet and a relatively quick
victory for the French. Li negotiated the convention ending this conflict, which recognized France's suzerainty (dominion) over Vietnam. In 1894 smoldering tensions in Korea erupted into war between China and Japan. Again China was quickly defeated, and Li was called to negotiate a settlement. The Treaty of Shimonoseki formally ending the hostilities granted Japan an indemnity of 230 million tael (a value based on the weight of silver) and ceded Chinese territory, including the island of Formosa and the Pescadores. Stipulations might have been more severe if Li had not been wounded by a Japanese fanatic during negotiations. Nevertheless, Li bore the brunt of criticism for this humiliating treaty and for the loss of his northern fleet during the war. He was reassigned to non-political posts but still conducted one more controversial negotiation. In 1896, while in St. Petersburg, Russia, to attend the coronation of Czar Nicholas II, Li and Count Witte signed an agreement allowing Russia railroad rights through Mongolia and Manchuria. Li was again criticized for ceding Chinese territory, and rumors circulated that he had accepted a huge bribe.

Reform and Industry

Perhaps even more significant than his military and political service was Li Hongzhang's contributions to China's self-strengthening. In 1872 he created the China Merchant Steam Navigation Company, one of the era's most successful government-private joint enterprises, which proved highly effective in competition with foreign shipping firms. In 1878 he constructed a modern textile factory in Shanghai to counter increased foreign imports. In order to improve communications, he built a national
telegraph line that linked China’s major cities and connected Chinese officials and businessmen to the world via the international telegraph cable. He was also instrumental in promoting the use of railroads, building one of the first to facilitate the transportation of coal from the Kaiping mines.

Li believed that a strong state needs a strong military. In the 1880s he established arsenals in Tianjin to produce ammunition for the army’s imported rifles and purchased modern gunboats for his northern fleet stationed at Weihaiwei in Shandong Province. He sent promising naval students to Europe for training and invited foreign experts to teach at his new Tianjin Naval Academy. By 1882 Li’s northern fleet consisted of twelve formidable gunboats and cruisers staffed by Western-trained officers and engineers, and the combined navies of the country now included fifty steam warships—half of which were constructed in Chinese shipyards.

Implications

In the early 1890s Li Hongzhang reached the apex of his career. On his seventieth birthday in 1892 he was showered with gifts by the emperor and empress dowager, honoring his contributions to China’s stability and modernization. However, despite his success in implementing self-strengthening programs in technology and defense, China proved no match in conflicts with European or Japanese troops. Military defeats and the humiliating stipulations of the Treaty of Shimonoseki cast a shadow over his career, and bribery claims associated with the Russian railroad lease through northern China further clouded his legacy. He died of illness just two months after concluding negotiations with foreign powers over the Boxer Rebellion.

Li Peng, son of Zhou Enlai, was premier of the PRC from 1988 until 1998. He achieved notoriety for supporting the crackdown during the 1989 Tiananmen protest. Li also took steps to rein in China's high inflation in the 90s and begin sweeping reforms of state-owned enterprises.

Born in Chengdu, Sichuan Province, Li Peng is the orphaned son of a Chinese Communist Party (CCP) worker and was adopted by Chinese premier Zhou Enlai (1898–1976). Li was trained as a hydroelectric power engineer in Moscow from 1948 to 1955. After his return to China he was the director and chief engineer at several power plants from 1956 to 1966 and later held various bureaucratic or party positions relating to power generation. In 1979, partly because of the backing of his stepmother, CCP Central Committee member Deng Yingchao (1904–1997), Li began a swift ascent up the hierarchy, first as deputy minister of power production (1981), then as a member of the Central Committee (1982) and vice premier in charge of energy and communications (1983). In 1985 he became a member of the Standing Committee of the CCP Politburo and in 1988 became premier, a post he held until 1998.

Li achieved his greatest notoriety during the Tiananmen Square incident of 1989. Strongly opposed to the student takeover of the square, he was perceived as patronizing during meetings with student leaders and was heckled at a televised meeting with hospitalized hunger strikers. He sided with other hard-liners against Zhao Ziyang (b. 1919), who was removed as party leader. Later news media and students frequently referred to Li as the “butcher of Beijing” for being the first official to publicly support the People’s Liberation Army’s bloody crackdown on students during the night of 3–4 June.

After 1989 Li cooperated with CCP leader Jiang Zemin and economics czar Zhu Rongji to rein in China’s high inflation and begin sweeping reforms of state-owned enterprises. Elected chair of the National People’s Congress despite an unprecedented two hundred negative votes in 1998, Li remains an influential voice in policymaking.

Li Qingzhao is considered to be China’s foremost woman poet. She wrote during the Song dynasty; only a hundred of her poems have survived.

Li Qingzhao was born in the city of Jinan in the province of Shandong. Her family belonged to the upper echelons of northern Song dynasty (960–1279) society, and she likely had made a name for herself as a poet, calligrapher, and painter well before she was married at the age of seventeen to Zhao Mingcheng, the son of a royal minister in the court of the Song emperor.

These were halcyon days for Qingzhao, and the few poems of hers that survive from this period are filled with expressions of bliss and include descriptions of married life that suggest that her husband shared in those very things that were important to Qingzhao, such as literary pursuits, artistic endeavors, art collecting, and politics of the court. Chief among these pursuits was book collecting, and soon their library contained some of the choicest volumes of the Song period. The couple wrote delicate poems to each other, especially when Mingcheng had to be away to attend to the demands of his position.

Their world changed abruptly, however, in 1127 with the fall of Bianliang (Kaifeng) to the invading Jurchen, who had emerged from northern Manchuria and who quickly consolidated their rule by abducting the northern Song emperor, Qinzong, along with most of the royal family; Qinzong was exiled to a remote part of northern Manchuria. During this time of chaos the house in which Qingzhao and Mingcheng lived was burned, resulting in the loss of most of the things the couple had collected over the years, including their valuable books. They hastily gathered what belongings remained and fled with them to a new home in Nanjing, but this place of refuge could never equal the home they had lost. By 1129 Zhao Mingcheng was dead. This came as a cruel blow to Qingzhao; her husband had been the foundation of her life. The poems from this period of her life are filled with bleak hopelessness, wherein the best she can do is safeguard the things remaining from her once-happy life in Jinan, namely, the poetry the couple had written to each other.

One of the first acts of the Jurchen Jin dynasty (1125–1234) when it established its rule was to dismiss all the officials who had worked for the previous emperor. Because she belonged to the class of society that had served the Song emperor, Qingzhao’s financial position grew somewhat precarious, and by 1132 she was living in rented rooms. Of the many poems she and her husband had written she now possessed only a meager collection; the rest had been pilfered by various people she had dealt with as she wandered from one place to the next. But she diligently set about publishing what remained of her books in a series of volumes entitled Jin shi lu (Record of Bronze and Steel), in which she meticulously set down an accounting of the artifacts and artwork she and her late husband had collected. In the final volume of the series Li Qingzhao wrote a moving memoir of her married life. Some evidence indicates that she remarried in later years, although briefly; but this is a point of contention. The last record of her comes from Zhejiang Province, after which she disappears from
The Poetry of Li Qingzhao

The heavens join with the clouds.
The great waves merge with the fog.
The Milky Way appears
Turning overhead.
A thousand sails dance.
I am rapt away to the place of the Supreme,
And here the words of Heaven,
Asking me where I am going.
I answer, “It is a long road, alas,
Far beyond the sunset.”

I try to put it into verse
But my words amaze me.
The huge roc bird is flying
On a ninety thousand mile wind.
O wind, do not stop
Until my little boat has been blown
To the Immortal Islands
In the Eastern Sea.

Li Shangyin lived a precarious existence during a tumultuous age—six emperors ruled during his lifetime. Although Li is best known as a “love poet” who expressed his sorrows and struggles in the context of unrequited or thwarted romance, the label doesn’t account for his artistic depth and range. Nearly six hundred of his poems survive and have been studied and admired for centuries.

Li Shangyin was a literatus-official who lived during the chaotic waning years of the Tang dynasty (618–907 CE). His zi, or courtesy name—a two-syllable pseudonym that replaced a given name, but was never used in conjunction with the family name, of an educated Chinese man—was Yishan. Although he never achieved an official post higher than the fifth level (out of nine), remarkably he survived the turbulence of continual court purges, regime changes, mass murder, and revolution that dominated the political atmosphere of his day. The statistic often cited in relation to the chaotic political backdrop of Li Shangyin’s writings is that six emperors ruled during his life. As a result, Li often struggled to survive in the combat between at least two powerful political factions to which he was obligated to appeal for support and livelihood. The instability that dominates Li’s biography enables his readers to understand why his poems are full of heart-rending sorrow and despair.

Li often expressed his despair in poems of unrequited or severed romance. It was conventional in traditional poetry to guise political appeals in romantic allegory, and Li elevated this kind of writing to an unprecedented level of sophistication. His four-poem suite “The Terrace of Yan,” for example, may be profitably read as an expression of genuine romantic despair. His famous “Untitled Poems” are usually read as multilayered compositions, with a surface mimesis (imitation) concerning romantic interludes and other layers that communicate sadness over political and moral decline or appeal to possible political patrons. Many of Li’s romantic poems also refer and allude to fantastic myths and colorful historical legends. Although Li continues to be referred to today in major monographs as the greatest “love poet” of the tradition, this appellation does not suffice in connoting his range or depth.

Li has been admired over the centuries as the greatest master, after Du Fu (712–770), of heptasyllabic (seven-syllable) regulated verse. More than half of his 598 poems...
extant poems are written in this form, of which the majority of his "Untitled Poems" deserve to be called masterpieces. Whereas Du Fu is usually considered the greatest writer of regulated verse, Li Shangyin achieves the more romantic, ambiguous, refined, and allusive presentation in this form.

A major field of Li Shangyin studies consists of detailed exploration of his regulated poem, "The Brocade Zither." Considered both his pièce de résistance and a concentrated exhibition of all his poetic virtues, the poem is also difficult. For most readers "The Brocade Zither" concerns Li's regrets over lost love, but some readers observe that the unexpected shifts among allusions, images, and the texture of the poetic language reveal the poem as a meditation on the unreliability of language in capturing the illusive memory.

Indeed, "beauty in ambiguity" best describes Li Shangyin's overall poetic contribution. This idiosyncrasy of Li's poems led Liang Qichao (1873–1929) to write his famous assessment of Li Shangyin: "I cannot figure out what Yishan's poems are about...but I feel they are beautiful" (cited in Wu 1998,169).

Tyler C. PIKE

LI Shizhen ▶
Li Shizhen 李时珍

Li Shizhen was a scholar of medicine and natural history who flourished during the late Ming dynasty (1368–1644). Though he wrote several poems and medical treatises, Li is best known as the author of the *Compendium of Materia Medica* (*Bencao gangmu* 本草纲目, 1596), an encyclopedic work on Chinese medical drugs.

Li Shizhen was born and raised in the district of Qizhou (now in Hubei Province), where his family enjoyed a comfortable reputation in the medical profession. His grandfather had made his living as a traveling bell doctor, a class of physicians that was looked down upon by some for openly peddling medical skills to make money. Li’s father, Li Yanwen, had enjoyed a relatively secure reputation as a medical scholar, treating patients and composing a number of treatises on diagnostic methods and local products such as mugwort and ginseng.

Li was briefly installed in a medical position at the imperial palace but spent the majority of his young adulthood treating local patients and traveling extensively in order to compile research for his medical works. Li moved back to Qizhou in 1561. He lived in a garden house that he dubbed “a hermit’s dwelling” after a favorite line in the *Classic of Poetry* and took the zi (or courtesy name, a two-character pseudonym that replaced a given name, but was never used in conjunction with a family name, of an educated Chinese man) of “Binhu” (Near the Lake) to mark this new phase of his life.

Li spent the remainder of his life writing such varied texts as a volume of poetry, a treatise on a dappled snake indigenous to Qizhou, and monographs on several topics of medical theory. Only a few of these works have survived, including three treatises on pulse diagnosis: the *Binhu maixue* (Binhu’s Study of Vessels), the *Qijing baimai kao* (Studies of the Eight Irregular Vessels), and the *Maijue kaozheng* (Rhymed Investigation into the Vessels). Only two of Li’s poems, both written for close friends and fellow scholars from Hubei, are extant.

The work for which Li is best known is *Compendium of Materia Medica* (*Bencao gangmu*, 1596), an encyclopedic work on Chinese medical drugs. Li intended to update, correct, and expand current knowledge of Chinese medical drugs and to that end spent thirty years researching medical and nonmedical texts, interviewing local people, and conducting experiments with plants, animals, and stones. The result was a massive text of fifty-two *juan* (roughly equivalent to chapters) and almost 2 million characters, including descriptions of 1,892 medical drugs. Li died before the work was published, with his family overseeing its printing and distribution.

Li Shizhen and his work continued to gain notoriety after his death. Li was reinvented as the figurehead of traditional Chinese medicine under Mao Zedong’s rule of the Chinese Communist Party. He was reimagined as a model barefoot doctor in books and propaganda posters and in films such as *Li Shizhen* (1956). He is currently
hailed in China as a founding father of Chinese science and medicine and has been memorialized in stamps, statues, and television programs.

Liang Qichao 梁啟超
1873–1929 Scholar and essayist

Liang Qichao 梁啟超 formed the moderate Progressive Party after the Republican Revolution of 1911 and twice served as a cabinet-level minister. He later withdrew to a life of teaching and scholarship.

Liang Qichao was a reform-minded scholar and essayist who rose to prominence after the humiliating defeat of China in the First Sino-Japanese War (1894–1895). In 1898 he was among the leading participants of the ill-fated Hundred Days of Reform sponsored by the progressive Guangxu emperor. After the reactionary restoration of Empress Dowager Cixi, Liang fled to Japan, where for the next fourteen years he edited a series of influential journals and wrote an impressive range of persuasive essays and monographs advocating political reform or revolution and introducing his contemporaries to Western liberalism, nationalism, and science.

In the aftermath of the Republican Revolution of 1911, Liang returned to China and formed the moderate Progressive Party (Jinbudang), which contended with the ruling Chinese Nationalist Party (Guomindang) in the nascent National Assembly. He twice served as a cabinet-level minister. With the onset of warlordism in 1917 Liang withdrew to a life of teaching and scholarship during which he wrote prolifically on Chinese culture, literature, and history. These later writings reflected his predominant aspiration for a new cultural synthesis in China that would combine the most worthy and enduring elements of Chinese Confucianism with the social and political principles of Western liberalism.

Liaoning Province

Liaoning Province is in the southern part of northeast China. Bounded by the Yellow and Bo Hai seas in the south, with a coastline 2,187 kilometers (1,359 miles) long, Liaoning covers a total area of 145,900 square kilometers: slightly smaller than Nepal. It is surrounded by Jilin and Hebei provinces, Inner Mongolia Autonomous Region, and North Korea. The Liao River, the principal waterway of the province, flows through the middle of Liaoning from north to south. The Yalu River on the eastern fringe forms the boundary between China and North Korea. The Liaodong Peninsula juts out between the Yellow and Bo Hai seas from the landmass. Liaoning has a zigzag coast and many rocky islands and fine natural harbors. It had an estimated population of 42.98 million in 2007. Ethnic groups living there include Man, Mongolians, Koreans, and Xibo.

Liaoning has a temperate continental monsoonal climate, with hot, rainy summers; long, cold winters with little snow; and short, windy springs. It has an average annual temperature of 6º–11º C (43º–53º F), a frost-free period of 130–180 days, and a mean annual precipitation of 400–1,000 millimeters (15–39 inches), which decreases notably from southeast to northwest.

Liaoning grows sorghum, maize, rice, and soybeans and the cash crops of cotton, tobacco, and peanuts. It is also the major grower of tussah, or wild, silk in China. The apples of southern Liaoning and the pears of western Liaoning are known throughout China. The province is a rich source of ginseng and pilose antler, valuable ingredients for traditional Chinese medicines. The fishery industry is developed along the coast.

Liaoning contains rich mineral resources, especially iron ore and coal. Fushun and Fuxin, popularly called the “coal capital” and the “coal sea,” produce top-quality coal at the largest opencast mining centers in China. With a well-grounded heavy industry, Liaoning is one of China’s major industrial bases. It leads the country in the production of iron and steel, aluminum, sulfuric acid, soda ash, heavy machinery, magnesia, and talcun. With its railway mileage exceeding 4,000 kilometers (2,485 miles) of tracks, Liaoning has the densest network of rail lines in the country.

Shenyang, the provincial capital, is the largest city of northeast China, with an estimated 2007 population of 7.1 million. It is one of China’s economic, communications, and cultural centers. Shenyang is known throughout China for its machine-building industry.

Dalian, the most famous city in Liaoning, lies at the southern tip of the Liaodong Peninsula. One of the most beautiful cities in China, it is a tourist paradise, with
European-style architecture framing its skyline and miles of beaches along its oceanfront.

Liaozhai Zhiyi
Liáozháih āi Zhìyì
聊齋志異

Liaozhai Zhiyi 聊齋志異 (Strange Tales from a Chinese Studio) is a Chinese collection of short stories famous for its many fables describing the interaction between humans and supernatural beings such as ghosts, fox-spirits, and a host of immortal creatures and spectres.

The short stories comprising the collection Liaozhai Zhiyi (Strange Tales from a Chinese Studio) were compiled and written by Pu Songling (1640–1715). Pu was born into a merchant family of modest means in Zichuan, 100 kilometers east of Ji’nan in modern Shandong Province. Having passed the county civil service examination with distinctions, he repeatedly failed at the provincial level until, at the age of fifty, he stopped trying. Pu made a living working as a secretary and tutor and spent most of his life collecting stories and writing them down. In his preface of 1679 Pu acknowledged his indebtedness to traditional “recordings of the weird” (zhi guai) and “transmissions of the odd” (chuan qi) in works such as Gan Bao’s (early fourth century) Soushen ji (Records of Investigations of Spirits). Liaozhai Zhiyi is based on a variety of traditional and contemporary sources, and Pu embellished and expanded many of the stories.

Various handwritten copies were in circulation after 1679, and for the next thirty years Pu added stories to the manuscript. In spite of his financial struggles, Pu turned down a substantial offer for the manuscript made by a Shandong official around 1693, and his last manuscript copy was kept in the family after his death. From a postface written by Pu’s grandson Pu Lide (1683–1739) in 1739 it appears that handwritten copies were in great demand, and in 1766 the first printed edition of 431 stories appeared in Hangzhou. Since then handwritten manuscript copies containing some sixty stories not included in the printed edition have surfaced.

The stories are written in the literary language and characterized by a tight composition, numerous classical allusions, and Pu’s masterly sense of economy with words. He copies and develops different genres such as journal notes or historical biographies. Examples of the former include observations on strange events that have no story line, whereas the latter, based on real-life events, have plots progressing in chronological order. Liaozhai Zhiyi is primarily celebrated for the many stories depicting the interaction between humans and supernatural beings such as ghosts, fox-spirits, and a host of immortal creatures and spectres.

Although Pu freely mixes reality with fantasy and dreams, his description of Chinese society in the early years of the Qing dynasty (1644–1912) seems true to life. Most of the stories fall into two categories: romantic love stories, which praise purity and fidelity, or scathing pieces of social criticism, which target corrupt bureaucrats and landowners. A common theme is the confrontation between the passive frustrated scholar and the assertive woman who may be a benign spirit or an evil demon or even human. Several scholars have noted Pu’s interest in and favorable treatment of women, who are
Seizing A Fox

A common theme of the short stories found in the Liaozhai Zhiyi involve interaction between humans and super-natural beings such as fox-spirits as seen in this excerpt from Pu Sonling’s “Seizing A Fox.”

A certain Mr. Sun, an uncle of one of my distant relatives by marriage, had always been a gutsy man. Once, while taking a day-time nap, he felt a vague sensation of a creature mounting his bed and then his own body rocking and swinging upwards, as if floating on a puff of clouds and fog. He thought to himself, “Could this be a succubi (ya hu, literally, “oppressing fox”)? He took a peek at the creature, which was the size of a cat, with yellow fur and green snout, stealthily crawling toward him alongside his feet, as if trying to avoid waking him up. The creature slowly crept against his body; first his feet then his thighs fell numb as it touched them. As soon as it reached his abdomen, however, Sun abruptly sat up, hunched down, and grabbed its neck. The creature cried in distress but was unable to break loose. Sun urgently summoned his wife, who then tied up the creature with a sash around its waist. Clasping both ends of the sash, Sun laughed at the creature, “I have heard that you are skilled at transformation, now I am going to see with my own eyes how you are able to do it.” Before he was done speaking, however, the creature suddenly sucked in its abdomen to the size of a straw, almost slipping away. Greatly taken aback, Sun firmly clutched it with renewed force, but this time it swelled its abdomen until it was thicker than a rice bowl and so hard that it did not give in to Sun’s tight grip. As Sun instinctively loosened his hands, the creature again shrank. Fearing that it might break free, Sun urged his wife to kill it. She frantically looked around, unable to find a knife. Sun momentarily looked to his left to indicate to her where one was. When he turned back, he found in his hands only a sash tied in the shape of a noose, the creature having already disappeared.

often positively contrasted with their feeble spouses. Pu’s satirical criticism of society, which not surprisingly took aim at the official civil service examination system, has earned him labels such as “proto-Marxist” and “anti-Manchu.” Liaozhai Zhiyi has inspired scores of plays and films and has been translated into English several times.

Further Reading

The Lifan Yuan (Office to Administer Foreign Barbarians), established in 1638, was the Qing dynasty’s principal organization for supervising the tribute system, during which outsiders brought (but mainly received) gifts to the Chinese court. It persisted in this important role until nearly the end of the dynasty when pressures exerted by the outside world, principally contact with Western powers, caused change.

Imperial Chinese foreign policy, whatever the pragmatic reality, was always rooted in a Confucian tributary system whereby outsiders—“barbarians”—had the obligation, in the well-known words of the Chinese philosopher Mencius, to “come to court and bear tribute” and thus recognize the superior virtue of the Chinese ruler. This was true even if in reality the gifts usually returned by the emperor in exchange for the tribute exceeded its value by a substantial margin.

Various agencies supervised such actions throughout imperial history and often intervened in the countries from which tribute came to express the superior power and position of China and to ensure the continued maintenance of the tribute system and thus the traditional order itself. The Qing dynasty (1644–1912) was no exception. Among the agencies supervising the tribute system and trade and the countries involved was the Lifan Yuan (Office to Administer Foreign Barbarians), established in 1638 and staffed by Manchu, that is, members of the multinational banners that constituted the core military and social groups of early Qing society. It was created by renaming an older agency, that of Mongolian affairs, even before the formal accession of the dynasty. Governing the operations of the office was a special set of rules and regulations that provided the basis for the operations of the Lifan Yuan for almost the entire Qing period and embodied long-term Chinese experience in dealing with outside peoples.

The Lifan Yuan later co-existed with the traditional Board of Rites (libu, one of six boards in the Qing government), the board with which tribute bearers, real or alleged, from the West and south were most likely to come into contact. As set up, the Lifan Yuan, which held nearly ministerial authority and was unique in its power in the Qing system, had charge of Qing relations with the Mongols associated primarily with what is now Inner Mongolia. This was an important function since the Manchu were then closely allied with Mongol princes by marriage, had borrowed the alphabet and key elements of their culture from the Mongols, and were heavily reliant on Mongol riders to back up their military striking power. Mongolia, as well as Manchuria, also bordered on Russia, and almost immediately the Lifan Yuan had dealings with that Western and at the same time Inner Asian power. Russia became the first country with which China signed a treaty as an equal (Treaty of Kiakhta, 1727), but the fiction of tribute participation continued to be asserted.

Later the authority of the Lifan Yuan, along with Qing power itself, was extended more generally westward to take charge of virtually all relationships with the peoples...
of Inner Asia. Here the driving force was Qing conquest of the Mongols and the gaining of a paramount influence in Tibet and in Xinjiang, an area that in the later nineteenth century became a Chinese province to counter Russian ambitions (and is now the Xinjiang Uygur Autonomous Region). Key events were the various Qing campaigns against the Dzungars and their eventual defeat, the gradual absorption of all of Mongolia (by the mid-eighteenth century), and the imposition of a Qing protectorate in Tibet to replace that of the Dzungars.

Although the central Asian trade of the old Silk Roads was no longer what it once was with the new maritime age, and although the central Asian states were no longer that menacing to China with the coming of gunpowder empires, a substantial flow of goods still existed. This flow was worth administering, and trade could be manipulated to bring the peoples and states involved under greater Chinese influence, thus the importance of the Lifan Yuan. This was particularly true for Mongolia, where the Qing pursued an active policy of economic divide and conquer, rewarding some with luxury goods and food, blockading others.

Although primarily an administrative organization, the Lifan Yuan carried on a considerable research on the peoples and cultures with which it was involved and provided language experts to the Qing government. The latter was an old tradition, and many foreign texts survive from antiquity in editions produced to train translators involved in the tribute trade, including what is now known as the Secret History of the Mongols, the Chinese version being originally intended to train Ming translators in using Mongolian documents. Among reference works produced by the Qing Lifan Yuan, or in whose production the Qing agency cooperated, were encyclopedias, often well illustrated, sometimes with hand-drawn color pictures, of strange customs and of the strange peoples offering tribute. Here, too, the officers of the Qing agency followed old precedents. One such book from the Song dynasty (960–1279), for example, deals extensively with the overseas trade upon which the Southern Song dynasty (1127–1279) was dependent. A significant part of the agency’s activities was providing special quarters for visiting envoys and their assistants, staging official banquets and other entertainments, and collecting and codifying law codes connected with tribute relationships and the countries involved, particularly Mongolia, and even some specially administered Buddhist temples. Buddhism was then the common religion of the Manchu themselves, their Mongol allies, and Tibet, the central authority for the Tibetan Buddhism involved, thus the eagerness of the Manchu to control it. The Lifan Yuan also had control of a system of subordinate agencies and of individually ranked religious and secular princes.

Although it remained a part of Qing government organization almost until the end, the Lifan Yuan declined considerably in importance as the role of Inner Asia in Qing life decreased. By the nineteenth century relations with Western powers were of far more significance, leading to an increasing reorganization of Qing government to try to respond better to the modern world; this modern world included Russian pressure in Turkistan, where the Russians attempted to seize some Qing domains taking advantage of the large-scale rebellion there. In 1861 the Lifan Yuan became China’s first real foreign ministry, the Zongli Yamen, an event marking the real end of traditional tribute relationships as the West kicked the door open.

Further Reading
Lin Biao was a military leader of the Chinese Communist forces and a propagandist for Mao Zedong. He died under mysterious circumstances in a plane crash in 1971; the plane was headed to Russia, where it was said he intended to defect. He was tried posthumously with the Gang of Four in 1980–81.

Lin Biao was a prominent general at the end of China’s Civil War, served as defense minister of the People’s Republic and finally as vice-chairman to Mao Zedong. The circumstances surrounding his death in 1971 were concealed until the government released an official statement in 1972 saying that Lin had been part of a failed conspiracy to depose Mao.

Early Career

Lin Biao, the son of a factory worker, was born in either 1907 or 1908 in Hubei Province. He attended Whampoa Military Academy where he was a member of the Socialist Youth League. Lin’s distinguished military career began in the Nationalist army, but he deserted to join the Communists in 1927. Lin commanded a Red Army corps during the Long March (1934–1935) and headed the Red Academy at the new Communist base at Yan’an. Lin was among the youngest and best of the Communist generals during the War of Resistance against the Japanese (also known as the Second Sino-Japanese War, 1937–1945). His genius for partisan warfare played a critical role in helping the forces of Mao Zedong (1893–1976) defeat Chiang Kai-shek and the Nationalists in Manchuria. He led the Red Army into Beijing in 1949.

Rise in Communist Party

Lin held several positions in the Communist Party and military hierarchy, although illness during the 1950’s may have hindered his career. After Lin became Minister of Defense in 1959, Mao relied on him to keep the People’s Liberation Army loyal and under control of the Communist Party in the period leading up to and during the Cultural Revolution (1966–1976). Lin is credited with the propaganda campaign of the 1960s. Called Mao’s “best student,” he compiled and wrote the forward to the collection of Mao’s quotations that became known as The Little Red Book. In 1966, Lin was elevated to the second-ranking position in the Chinese Communist party, and thus became Mao’s heir apparent.

Fall from Grace

Perhaps in part because public adulation of Lin rivaled that of Mao, tensions arose between the two. Mao spoke publicly in 1971 about his anger at Lin’s opposition to Jiang Qing (Mao’s wife) at the Second Plenum. Lin’s son Lin Liguo, a deputy director of the Department of Operations of China’s Air Force, apparently openly discussed opposition to Mao. Lin disappeared in September 1971,
and a purge of army leaders was conducted immediately after. In 1972 an official statement said that Lin and his family died in an airplane crash in Mongolia on 13 September 1971. Lin and his son were said to be part of a conspiracy to usurp supreme Party leadership (“Project 571”) and were said to be fleeing to the Soviet Union to seek sanctuary after the coup’s failure. In 1973, the Central Committee expelled Lin from the Communist Party posthumously, and in 1976, he was tried posthumously with the Gang of Four.

Charles DOBBS and Nicole MUCHMORE
From the earliest times in China verse dominated literary composition, while forms of opera and prose fiction developed into the most ambitious genres beginning in the fourteenth century. Experiments with features of Western literature in the early twentieth century grew steadily into a highly Westernized array of literature that largely displaced pre-twentieth-century forms.

Prior to the Han dynasty (206 BCE–220 CE) musical lyrics alone were discussed as a class of composition apart from history and philosophy, and prose narratives, whether factual or fictive, appeared almost entirely embedded in the work of historians and philosophers. The most ancient poetic texts are found in the Shijing (Book or Classic of Poetry or Songs) and the Chuci (Elegies of Chu). The 305 extant lyrics in the Shijing date between 1000 and 700 BCE, when the Zhou dynasty (1045–256 BCE) court collected them from different regions of the realm. Written largely in four-word, rhymed lines, the shi (verses) vary in length and range from eulogies for royal ancestral rites to depictions by unknown authors of daily routines and intimate life. The Chinese philosopher Confucius (551–479 BCE) praised them for their contributions to moral philosophy, and later philosophers and poets quoted them widely, giving them a prominent place in the curriculum of Confucian education. The verses thereby greatly influenced techniques of description and imagery throughout the history of Chinese poetry. The most authoritative edition, by Mao Heng and his son, Mao Chang, in the late first or early second century CE, stresses the relationship of the poems to emotion as distinct from other forms of composition.

The Chuci comprises a second early tradition of verse known as the sao form, which is associated with the ancient state of Chu (770–721 BCE) or with the region (roughly modern Hunan Province). In sao the natural imagery alluding to moral qualities that is also often found in the Shijing is more lush and ultimately part of a visionary, shamanic world of spirits, souls, and deities through which the living and the dead journey in search of emotional and spiritual fulfillment. Such a world frames the first poem attributed to a historical figure, the “Li sao” (Encountering Sorrow) by Qu Yuan, who describes a fantastic journey: Qu, having been slandered by fellow Chu courtiers who want the king to reject Qu’s proposal for a strategic alliance, sets out upon his exile in search of a deity to validate his moral stature.

The records of the Han dynasty preserved samples of anonymous folk ballads (yuefu) of varying line length collected by the imperial Music Bureau and also shi verse composed in a new form of five-syllable lines. Eventually members of the cultural elite composed in yuefu and five-syllable-line shi style, among them Cai Yan (Cai Wenji, b. 177 CE), one of the earliest female poets credited by name, who recounted her lengthy captivity in a foreign tribe in a five-syllable-line shi poem. At the same time the sao form inspired members of the cultural elite to create a variant in rhymed prose, or prose poetry, called fu. The fu prose-poem began in homage to Qu Yuan as a way to
reflect on the misfortunes of official service, but as a vehicle for elaborate vocabulary it was then appropriated to describe the pleasures and wonders of imperial life. The increasing stylization of language in the *fu* resulted in a form of parallel prose written in alternating phrases of four and six syllables, known as the “four-six style” (*siliu wen* or *pianti wen*), which would last as an important style until the early twentieth century.

## Prose Narrative

The expansion of Daoist thought and its interaction with the arrival of Buddhism from central Asia during the Han dynasty stimulated imagination about both the geography of exotic regions and the realms of the supernatural. The court scholar Liu Xin (46 BCE–23 CE) compiled the fantastic geography of the *Shanhai jing* (Classic of Hills and Seas) as information on arcana (mysterious bits of knowledge) and anomalies necessary to governing the empire. After the collapse of the Han dynasty the number of published collections of short anecdotes of spirits increased, many edited by men of official standing writing unofficially, such as the 464 stories that an official historian, Gan Bao (317–420), published, not among his historical records but under the title *Sou shen ji* (Search for the Supernatural). Buddhist- and Daoist-inspired biographies, imitating the form but varying from the content of official historical biographies, also appeared, as did biographical anecdotes, also departing from official historical accounts, most famously in the studies of personal qualities attributed to historical figures in *Shi shuo xin yu* (New Anecdotes of Tales of the World) by a prince, Liu Yiqing (420–479). The single most famous story handed down from the post-Han North and South Dynasties (220–589) still inspires contemporary writing. This is the “Tao hua yuan” (Peach Blossom Spring), which the poet Tao Qian (Tao Yuanming, 365–427) included in his sequel collection to Gan Bao’s supernatural tales; it is a Daoist-inspired story of a fisherman who discovers a utopian community of refugees that has remained unknown for centuries. The growing body of prose narratives set in known historical and geographic contexts, but devoted to characters and situations not confirmed by official records, developed during the Tang dynasty (618–907 CE) into vividly and intimately depicted stories called *chuanqi* (communicating the unusual or romances), a category that included famous love stories.

## Later Poetic Forms

The interaction of Chinese empires with central Asia resulted in even more innovations than the legacy of Buddhism, and these innovations included new forms of poetry. The first of these was *lüshi* (regulated verse), inspired by the prosody of Indian Sanskrit poetry, a genre studied by Shen Yue (441–513). This form dictated an arrangement of phonological tones within rhymed lines of five or seven syllables, organized in parallel couplets and normally limited to either eight lines or four lines (*jueju*). Its most celebrated practitioner, Du Fu (712–770), acquired a reputation that has lasted to the present. Like all writers before the Yuan dynasty (1279–1368), Du Fu served as an official, and his devotion in his verse to the welfare of the empire made him the epitome of the poet as scholar-official. No topic represented in his poetry, whether history, landscape, or daily life, was removed from considerations of affairs of state or the needs of its subjects. Du Fu’s ability to bring what was considered a plain, often humorous, voice and a Confucian sense of mission to a form as ornate as regulated verse fulfilled fundamental criteria for evaluating poetry that had been articulated in previous centuries in major studies of the art, such as the *Shi pin* (Evaluation of Poetry) by Zhong Rong (469?–518) and *Wenxin diaolong* (Literary Mind and the Carving of Dragons) by Liu Xie (b. 465).

Yet, in Du Fu’s own time the most popular poet (although not admired by the Tang court) was a follower of Daoism, Li Bai (Li Bo, 701–762). In Li Bai’s poetry landscape offers a release from historically defined duty and an inspiration to envision a realm of Daoist deities and resources to unlock the alchemical secrets of immortality, invoking an intimacy between his wine-inebriated persona and the cosmos. Ultimately, the pairing of Du Fu with Li Bai as the two greatest poetic geniuses served the tradition of the cultural elite themselves as the keepers both of the Confucian society and the Daoist knowledge of cosmic existence. Nor did this tradition exclude appreciation of Buddhism as a layman, exemplified most famously in the poetry of a contemporary official, Wang Wei (701–761).
By the late ninth century central Asia again contributed to poetry through a new musical form for which the lyrics were known as *ci* (song lyrics). Composed for entertainment, often by professional women entertainers, each tune required a different form, and each lyric was known by the title of the tune for which it was written. Although women as professional entertainers had composed *shi* poetry, such as the gifted public relations courtesan of a governor of Sichuan Province, Xue Tao (770–830), the newer *ci* form was initially regarded as outside the range of writing by which men of the cultural elite were evaluated as scholar-officials. The ability of Li Qingzhao (1083–1149?) to evoke the pleasures of her youthful life with her husband, then the sadness of widowhood and aging, as well as to theorize about poetry, made her the most famous woman poet in Chinese history. But men writing in the *ci* form to express emotion—the sadness of Li Yü (937–978) over the loss of his kingdom, for example, and the exquisitely sympathetic observations of courtesans by Qin Guan (1049–1100)—were not listed among the greatest male poets, despite their talent. This divide, one of formal and gender and social conventions, was broken by Su Dongpo (Su Shi, 1037–1101) when he began writing and distributing *ci* poetry on occasions and on topics that called for *shi* verse. Moreover, his *shi* poems both acknowledged and broke free of the models established by the Tang poets. His innovations inspired generations of writers since, among them Chinese Communist Party leader Mao Zedong, who in the twentieth century used the *ci* form for some of his most famous poems on revolution and conquest.

By the thirteenth century musical inspiration for verse was shifting again, this time to a form known as *qu*, similar to *ci* but written in sets of new tunes for the growing genre of music theater. Thus, although volumes of single verses in *qu* form were published, the most famous authors were the playwrights of the thirteenth-century music theater.

**Oral and Performing Literature**

Music theater, or forms of opera, developed into the most ambitious genre of performing literature, the earliest written examples of which are the *chantefable* (French for "song-story") of Buddhist proselytizers in the tenth century known in Chinese as *bianwen* (transformation texts). These popular tales were written down in the vernacular in which they were recited and sung, providing a major early example of spoken language at a time when writing remained dominated by classical and literary styles commonly used among the cultural elite. By the twelfth century performance had also developed into music theater in varying forms. After the consolidation of the Mongol Yuan dynasty the northern *zaju* (variety act) opera dominated, offering vernacular dialogue interspersed with songs in the *qu* verse form according to prescribed suites. The centerpiece is *Xi xiang ji* (Western Chamber) by Wang Shifu, a romantic comedy of illicit love between a poor, young scholar and the daughter of the widow of a powerful official. The most prolific and revered playwright, Guan Hanqing, is best known for his operas of common people struggling against injustice, epitomized by crime and court case melodramas, such as *Dou E yuan* (Injustice to Dou E), in which an innocent woman allows
herself to be executed for a crime in order to spare her mother-in-law, also wrongly accused.

The growing interest in and patronage of opera among ruling families and officials eventually brought greater status to playwrights, especially after a southern form of opera, eventually known as chuanqi (romance), developed a new musical form in an expanded and more elaborate drama. In 1367, as the Yuan dynasty was falling to the Ming dynasty (1368–1644), a retired official, Gao Ming, completed a southern opera entitled Pipa ji (Lute); it remains one of China’s most enduring opera stories. The plot involves a young man, Cai Bojie, who must leave his wife Wuniang and his parents to take his civil service examination in the capital; after placing first in the exams he is implored to stay and marry the daughter of a high-ranking official. Wuniang, enduring hardship, takes care of Cai’s parents throughout a period of famine (some trickery and deception keeps Cai unaware of their plight). When the parents die Wuniang goes to the capital to be reunited with her husband, taking her lute to earn some money along the way. The Ming court viewed the dilemma of the male protagonist—whether to obey his emperor or serve his parents—with enthusiasm, thus promoting the high status of opera among the cultural elite.

As a literary form opera reached its peak after musical revisions known as kunqu (Kun songs) in mid-sixteenth century; kunqu were often so lengthy that a complete performance could often take more than a single day. Tang Xianzu (b. 1550) is the acknowledged master of this era of opera. His Mudan ting (Peony Pavilion), about the power of passionate love first to take the life of a young girl through love sickness and then to restore her through the lover of her dreams, runs to fifty-five scenes. The vitality of kunqu as a literary form lasted through the seventeenth century, when Hong Sheng completed Chang sheng dian (Palace of Eternal Youth, 1688) about the ruinous but irresistible love of the Tang dynasty emperor Ming Huang for his consort, Yang Guifei. Also Kong Shangren, a descendent of Confucius, authored Taohua shan (Peach Blossom Fan, 1699) about the fall of the Ming dynasty. During the eighteenth century patronage of the theater increasingly turned to short performances of scenes abstracted and revised from the operas of previous centuries. Toward the end of the century Qing dynasty (1644–1912) royalty showed a preference for a newer form of music theater that came to be known as Jingju (Peking [Beijing] Opera). Featuring more ambitious movement in the acrobatics of stage combatants, Jingju turned decidedly toward performance art and away from literary ambition.

**Fiction**

The attention that oral and performing literature paid both to the drama of ordinary folk and to exciting historical figures provided a great impetus to the development of vernacular and semivernacular fiction from at least the fourteenth century, when the first novels are known to have appeared. While the short story (huaben) greatly expanded vivid accounts of ordinary people, culminating in the three collections (Sanyan) written by an official, Feng Menglong (1574–1646), the novel at first provided elaborate syntheses of sources on historically based legends already popular in theaters. The earliest of the widely read novels, Sanguo yanyi (Romance of the Three Kingdoms), attributed to Luo Guanzhong but later commonly read in an edition edited by Mao Zonggang in 1622–1623, gathers a wide range of sources on the heroes of warfare after the collapse of the Han dynasty. The historical genre exemplified by Three Kingdoms was followed by the inspiration of legend, as in the masterfully written but brutal novel of bandit life, Shuihu zhuan (Water Margin or Outlaws of the Marsh; earliest known edition 1540), and then by historical fantasy in Xiyou ji (Journey to the West; earliest extant edition 1592) by Wu Cheng’en, in which a monkey endowed with magical powers is made to accompany a monk, known in actual history, and his companions on a journey to central Asia in search of Buddhist texts.

In the early seventeenth century various editions of the novel Jin ping mei (Plum in the Golden Vase) were published, depicting the life of a wealthy, corrupt pharmacist and his wives and concubines. Although it is most famous for its pornographic passages (excised from all twentieth-century editions), it would inspire later novels of domestic life. Thus, the relationship of one young boy with his sisters, female cousins, and maid servants in the extended household of an aristocratic family provides the main narrative in the most famous novel, known alternately as Shitou ji (Story of the Stone) and Hong lou
meng (Dream of the Red Chamber or Dream of Red Mansions), attributed to Cao Xueqin but believed to have been revised after his death for its published editions in 1791 and 1792.

Twentieth-Century Literature

The variety of novels increased throughout the nineteenth century, and novels increased in numbers after 1900 as Confucian culture waned and the cultural elite began to shift toward responding to Western cultures. In 1917 scholars educated overseas rebelled entirely against the cultural leadership of older generations, first in an essay by Hu Shi (1891–1962) that advocated eliminating the use of classical Chinese and then in a vernacular short story by Lu Xun (Zhou Shuren, 1881–1936), "Kuangren riji" (Madman’s Diary, 1918), which condemned Confucian moral vision after the manner of the German philosopher Friedrich Nietzsche’s critique of Christianity in Europe. Although the tradition of Chinese poetry maintained some status, Chinese writers turned largely to writing fiction for newspapers and magazines following Western models. A series of partially autobiographical novels by young writers struggling with modernity in the 1920s culminated in Jia (Family, 1931–1932) by the anarchist Ba Jin (1904–2005). The first playwright to write full-length spoken dramas that were successful with audiences, Cao Yu (Wan Jiabao, 1910–1996), also focused on family conflicts. During the 1930s novels dealt increasingly with political issues. Mao Dun (Shen Yanbing, 1896–1981) promoted the growing Marxist vision of the collapse of capitalism during the Great Depression in Ziye (Midnight, 1933); the plight of the poor was explored in Luotuo Xiangzi (Camel Lucky Boy or Rickshaw, 1937) by Lao She (Shu Qingchun, 1898–1966). The period of the War of Resistance against Japan (1937–1945, known outside China primarily as the Second Sino-Japanese War) produced important propaganda, most famously the Communist innovative opera depicting a peasant girl exploited by a landlord, Bai mao nü (White-Haired Girl, 1945), but also some of the most admired fiction of life among the educated elite of the occupied city of Shanghai, including the short stories of Zhang Ailing (Eileen Chang, 1920–1995) in Chuanqi (Romances) and the novel Wei cheng (Fortress Besieged, 1945) by Qian Zhongshu (1910–1998), whose wife, Yang Jiang (b. 1911), wrote popular spoken dramas.

After 1949 and the founding of the People’s Republic of China, writers under both the Kuomintang (Guomindang, Chinese Nationalist Party) on Taiwan and the Chinese Communist Party on the mainland pursued themes of their civil war. During the 1960s university students in Taiwan began to turn to modernist fiction, best known through the short stories of Bai Xianyong (b. 1937), Taibeiren (People of Taipei, 1971), and the novels of Wang Wenxing (b. 1939), Jia bian (Family Catastrophe, 1973) and Beihai de ren (Backed against the Sea, 1981). A politically dissident literature followed in the 1970s, then a large, diverse movement in the 1980s and 1990s to restore dominance in literature to the subethnic populations historically inhabiting the island, then feminist literature before the turn of the century.

Movements such as those on Taiwan remained distinctly minor trends or were completely suppressed on the mainland. Until the late 1970s, after the end of Maoist leadership, literature largely followed concepts developed in the Soviet Union in support of agricultural collectivization, representing the history of the revolution and providing models of good workers, peasants, and soldiers. Ding Ling (Jiang Bingzhi, 1904–1986), a widowed veteran of the revolutionary movements, produced the most noted novels of this period, Taiyang zhao zai Sangganhe shang (Sun Shines on the Sanggan River, 1948), about the challenges of land reform. The shift in cultural policy from such prescriptions to a prescriptive censorship in the late 1970s led to a wide range of creativity, from the modernist verse by poets such as Bei Dao (Zhao Zhenkai, b. 1949) to fiction featuring satire by Wang Shuo (b. 1958), social criticism and alternative history by Mo Yan (b. 1956), a major new emphasis on female subjectivity by Wang Anyi (b. 1954) and other women writers, and views inspired by ethnic minority cultures, such as the novels of Tibetan culture by Alai (b. 1959). Visionary literature of a collective unconscious appeared in Ling shan (Soul Mountain, 1990) by a modernist writer living in France, Gao Xingjian (b. 1940), who in 2000 was awarded the first Nobel Prize for Literature given to a Chinese writer.

Mù yǐ chéng zhōu
Known in the West as “The Little Red Book,” *Quotations from Chairman Mao Zedong* 毛泽东语录 is a thirty-three-chapter collection of 427 quotes from Chinese Communist Party leader Mao Zedong. It was a linchpin in the early stages of China’s Cultural Revolution (1966–1976), representing the essence of Mao’s ideas, officially known as “Mao Zedong Thought.”

Hundreds of millions of copies and numerous versions of *Quotations from Chairman Mao Zedong* were printed and were almost ubiquitous in China during the Great Proletarian Cultural Revolution (1966–1976), to use the era’s official name. Students, soldiers, workers, and peasants read from and discussed the book—its thirty-three chapters brimming with 427 of Mao’s quotations—at frequent study meetings where they could share their ideas about how to apply Mao’s teachings to daily life. Such groups allowed even the illiterate access to Mao’s thought and writings.

The Little Red Book was originally printed, distributed, and studied within the People’s Liberation Army in 1964 under Defense Minister Lin Biao, Mao’s strongest ally during the early period of the Cultural Revolution. Its purpose was to provide a shortcut to understanding the works of Mao, thus helping China to avoid the errors that had undermined socialism in the Soviet Union, errors that were seen as severely influencing the very nature of the Chinese Communist Party (CCP) itself. As Lin Biao’s star rose, the cult of Mao, including not only The Little Red Book but also much more, spread throughout China. Lin was later rightly accused of encouraging the cult for his own purposes. Although in 1970 Mao criticized the cult as excessive, he, too, saw it as useful. During this period the book, most frequently with an opening inscription in Lin Biao’s handwriting, became both an icon to be waved and a beacon of correctness to be applied in daily life.

*Quotations from Chairman Mao Zedong* highlights Maoist concepts, including the necessity of the leadership of the Communist Party, the importance and duration of class struggle, why U.S. imperialism was a paper tiger, the need to ceaselessly and selflessly struggle to overcome all obstacles to serve the needs of the people, towing the mass line (that is, taking the unsystematic ideas of the masses, having the Communist Party make them into systematic policies that are then returned to and carried out by the masses), and his attitudes toward self-reliance, equality (but not feminism) for women, criticism, and self-criticism.

Mao Zedong Thought, the CCP’s name for Mao’s ideas, has been criticized primarily for overemphasizing class struggle, particularly for not having clear definitions of the classes and ignoring objective factors in favor of the ability of human will to overcome all obstacles. But the Little Red Book had additional flaws. It resulted from and perpetuated a view that complex problems can be solved with simplistic answers. While Mao’s Thought
did provide an underlying unity throughout China, this simplification allowed conflicting groups to use different quotes to support different positions, a practice known as “waving the Red Flag to fight the Red Flag.”

After Lin died in 1971, discredited by allegations that he led a coup attempt against Mao, the Little Red Book began to be downplayed. After the 1981 party verdict that pronounced the Cultural Revolution to have been an error, the book faded into obscurity. Subsequently it was commoditized into Cultural Revolution memorabilia. Today originals and reproductions in various languages are available for sale in gift shops around Beijing and elsewhere.

LIU Gongquan

Liu Gongquan was a calligrapher of China’s Tang dynasty (618–907 CE). He was also a professor and tutor of the Hanlin Academy for three emperors.

Born during the Tang dynasty (618–907 CE), Liu Gongquan, also known as Liu Chengxuan, was from a family of intellectuals in Yao County in Shaanxi Province. His grandfather and elder brother Liu Gongcuo were well-known writers and calligraphers. Although Liu was talented in poetry and calligraphy, he did not achieve his scholar (jinshi) degree until he was about thirty. Well versed in the Confucian classics, he was given a post as a recorder of civil matters in the country. For most of Liu’s career he served as a professor and tutor of the Hanlin Academy for three emperors: Muzong (reigned 821–824 CE), Jingzong (reigned 825–825 CE), and Wenzong (reigned 826–840 CE). It was not an ideal job for an ambitious man, but Liu accepted his place with ease. Because all three emperors were also lovers of calligraphy, Liu had a friendly relationship with them and was known to criticize the emperors for their misdeeds.

When he was young, Liu surprised others with his talents in poetry, especially couplets, and music. During the reign of Wenzong, Liu was known to compose a poem in three steps, twice as fast as Caozhi (192–232 CE), who finished a poem in seven steps. Once when Emperor Wenzong (reigned 841–846 CE) was angry with a palace maid, he was pacified when Liu presented him with a poem written in Liu’s beautiful calligraphy. Not only was the maid forgiven, but also Liu was also rewarded with two rolls of colorful brocade.

In calligraphy critics rank Liu Gongquan with another Tang master, Yan Zhenqing (709–785 CE). Both artists were best in the standard (kai) script, with Yan’s brushstrokes described as “fleshy and round,” whereas Liu’s were “boney and thin.” The works of the two are described as “Yan tendons and Liu bones.” Liu also shared with Yan another virtue: He spoke the truth in the face of power and danger. To the Emperor Muzong, who was a puppet ruler manipulated by powerful factions in court, Liu used a metaphor to give advice. When asked the way to handle a brush, Liu responded: “When the heart is straight, so will [be] the brush.” Muzong understood and was touched.

Although Liu was adept in all three scripts of calligraphy—the standard (kai), the running (xing), and the cursive (cao)—his best can be found in the first. His standard script combined the styles of Chung Yu (151–230 CE), Wang Xizhi (303–379 CE), Ouyang Sun (557–641 CE), and Yan Zhenqing (709–785 CE). “The Army of Divine Strategy’s Record of Imperial Virtue Stele” of 843 and “Stele for the Xuanmi Pagoda” of 841 are handed down to posterity via ink rubbings. Liu’s standard script was so valued in his time that an official would lose face if he could not obtain Liu’s writings in his late parents’ epitaph. Foreigners traveled to the Tang capital of Chang’an (Xi’an) to ask for Liu’s writings, which brought him great fortune. Liu spent

1340

© 2009 by Berkshire Publishing Group LLC
his time collecting books, calligraphy, inkstones, and brushes. As a calligrapher, Liu was particular about brushes, the best of which were made of slender bamboo for easy handling and bristles of long goat hair for ink absorption.

Because Liu was not ambitious and did not join political factions in court, he was exempted from political upheavals. Leading a life of art and leisure, Liu was probably the longest-living calligrapher in Chinese history when he died at the age of eighty-eight.

Liu Shaoqi was a leader of the Chinese Communist Party (CCP) whose career symbolized the political struggles in the People’s Republic of China during Mao Zedong’s era. Although it was once thought Liu would be Mao’s successor he was accused in 1966, at the beginning of the Cultural Revolution, of siding with capitalists. He was physically abused by the Red Guard, expelled from the CCP, and died in prison.

In 1956 he boldly proposed to reform China’s economy, a proposal that eventually cost him his life. Liu, with Deng Xiaoping (1904–1997), general secretary of the CCP, insisted that China’s socialism should focus on increasing the productivity and development of China’s economy. Liu increased his power in the CCP in 1959 when he replaced Mao Zedong as chairman of the PRC. However, Mao retained chairmanship of the CCP and was in charge of the daily work of the PRC and CCP before the Cultural Revolution (1966–1976). Liu Shaoqi supported Mao’s plans during the Great Leap Forward (1958–1960). However, Liu began to clash with Mao in 1960 over economic policy. In 1961, Liu made a forty-four-day trip to his hometown, in Hunan Province, in order to determine how much the Great Leap Forward damaged the Chinese economy. It had been forty years since Liu left his hometown; it would also be his last visit to his birthplace before he died. During his tour of Hunan Liu determined that the damage to the Chinese economy was 70 percent due to human mistakes (meaning economic policy) and 30 percent due to natural disaster. In 1962, Liu Shaoqi made the important speech at the seven-thousand-person congress in Beijing. His report did not please Mao. While Mao preferred rapid development based on the labor of the Chinese masses, Liu preferred a slower growth, placing economic reliance on a small nucleus of technical experts.

In 1966, at the beginning of the Cultural Revolution, Liu was accused of “taking the capitalist road,” having committed “counterrevolutionary crimes,” and being “China’s Khrushchev.” Liu and his wife, Wang Guangmei (1921–2006), were arrested in 1968. In 1946...
Wang Guangmei, who had good education and spoke English well, had been a translator for U.S. secretary of state George Marshall (1880–1959), who mediated unsuccessful peace talks between the Communists and the Chinese Nationalist Party (Guomindang). Her intellectual performance eventually raised the ire of Mao’s wife, Jiang Qing (1914–1991), during the Cultural Revolution.

Liu Shaoqi was physically abused by the Red Guards (students who admired Mao during the Cultural Revolution), expelled from the CCP in 1968, and died in Kaifeng in 1969. Red Guards discovered him lying dead on the floor of his prison cell, apparently the victim of medical neglect; his family was not informed for three years after he died (and the rest of the Chinese people were not notified for another ten years).

The CCP rehabilitated Liu’s name in 1980 but only after fourteen years of humiliating damage to his reputation. According to Wang Guangmei’s recollection, Liu Shaoqi had said, “If this (Cultural Revolution) is continuing, our nation will be destroyed. This is not a part of Marx-Leninism. I need to write a letter to Mao Zedong” (cited in Wang 2000). Even though Liu’s life was at risk during the chaotic period, he worried about China’s future, not his own. When Deng Xiaoping delivered the eulogy at Liu’s funeral on 17 May 1980, Deng never mentioned any responsibility or mistakes by Mao Zedong, who had allowed the Gang of Four to abuse Liu’s human rights. Today Liu Shaoqi has a museum in his memory, which also commemorates the former Chinese first lady, Wang Guangmei, in Hunan Province.

Champion hurdler Liu Xiang was the first Chinese man to earn a gold medal in an Olympics track event, winning the 100-meter hurdles at the 2004 Summer Games. The achievement earned him national popularity and global sponsorship, and made him the embodiment of China’s dreams for the 2008 Olympics, until a hamstring injury forced him to pull out of competition.

Liu Xiang was the first Chinese man to win a gold medal in track at the Olympics, completing the 110-meter hurdles at the 2004 Summer Games in Athens in 12.91 seconds to match what was then the world record in the event. Already known to insiders and followers of the sport for his accomplishments as a youth champion, he became an immediate public sensation in China, where media hailed his victory as a repudiation of China’s “sick man of Asia” legacy and an assertion that “yellow men can run.” His dramatic win also translated to instantaneous marketability, bringing endorsement deals with Visa, Coca-Cola, Nike, China Mobile, and other companies that have made him one of China’s wealthiest athletes, second only to basketball player Yao Ming. His celebrity also generated outsized expectations for his performance at the 2008 Beijing Olympics—dreams of another gold that were dashed dramatically when a hamstring injury forced Liu to abandon competition three steps into his opening heat for his signature event.

A Shanghai native who began training as a high jumper at age twelve and switched to hurdles at fifteen, Liu Xiang already was a junior record holder in several events and had won gold in the 110-meter hurdles at the World Student Games in Beijing and the East Asian Games in Osaka in 2001, and at the Asian Championships in Manila and the Asian Games in Pusan, South Korea, in 2002. A confident and stylish performer, Liu expressed astonishment at his winning time in Athens because even in training he’d never finished the event in under 13 seconds. He then went on to break the world record, set thirteen years earlier by Welshman Colin Jackson, with a time of 12.88 seconds at a July 2006 competition in Lausanne, Switzerland—just two days shy of his twenty-third birthday.

Liu Xiang has long emulated 1996 Olympian and four-time world champion Allen Johnson of the United States, whom he bested for the first time a few months before the Athens Olympics. Liu and Johnson continue to vie in the 110 meters, with Liu beating Johnson at the hallowed Prefontaine Classic in Eugene, Oregon, in May 2006, and Johnson beating Liu at the track World Cup in Athens in September 2006. Overall, Liu had a stellar year in 2006, culminating in a gold medal at the Asian Games in Qatar in December. In the first half of 2007 he won five of six international contests. Liu prides himself on having trained entirely in China and has a close working relationship with the coach, Sun Haiping, who first recognized Liu’s hurdling potential—the two share an apartment at their Shanghai training center. Liu also
has a reputation for independence, carving his own way through the Chinese sports system and resisting conventions of overtraining. He is known to enjoy karaoke, and his hip youthfulness and sense of fun have played well with corporate sponsors. One TV ad for Visa showed him racing kangaroos. In a deal with Amway, reportedly worth $1.25 million, he represents Nutrilite, a leading global brand of vitamins, minerals, and dietary supplements. *Forbes* magazine’s 2007 list of Chinese celebrity rankings put Liu Xiang second in terms of “social influence” after Yao Ming and fourth in income; his yearly earnings were estimated at $2.5 million.

Liu Xiang briefly came under criticism for signing on as a celebrity spokesman for a Chinese tobacco giant, Baisha Corporation, and Chinese sports authorities gave notice that Olympic athletes might have to refrain from commercial endorsements in the period leading up to the 2008 Beijing Games. But the threat never materialized. After Liu’s withdrawal several of his main sponsors—including Coca-Cola, Nike, and Visa—reaffirmed that he would remain an important advertising icon, although anticipated appearances in post-Olympic celebratory ads were dropped. Meanwhile his athletic attainments continued to generate privileges, including unusual academic status: Nominally a college student when he won gold in Athens, he subsequently was admitted to a doctoral program in sports studies at East China Normal University, evidence of what the *Shanghai Daily* called “a typical Chinese style, cross-field meritocracy” (Longman, 2008).

In December 2008 Liu underwent surgery on his right Achilles’ tendon in Houston. A widely watched Coke commercial on television, featuring Liu and his father, helped kick off the Year of the Ox in January 2009.

The Long March

Chángzhēng 长征

The Long March of 1934–1935, one of the seminal events of the twentieth century, had far-reaching implications not only for China but also for the rest of the world. Its most significant outcome, aside from fostering a Chinese Communist Party independent of the Soviet Union, was the rise of Mao Zedong as the party’s primary leader and theorist.

The 9,600 kilometer (6,000-mile) journey of retreat of the Chinese Communists in 1934 and 1935 has been glorified in party lore as the Long March. During the Nationalist-Communist Civil War, Communist forces marched from southeast to northwest China, across Hunan, Guangxi, Guizhou, Yunnan, Sichuan, and Shaanxi, to establish the Communist revolutionary base in an area beyond the control of the Nationalist troops under Chiang Kai-shek (1887–1975), leader of the Guomindang (Nationalist Party). Historians consider the Long March a landmark in the history of modern China. This was the time when the Chinese Communist movement started to forge its own destiny, independent of the Bolsheviks and other foreign revolutionaries. And this was the time that Mao Zedong (1893–1976) became the undisputed leader of the Chinese Communist Party (CCP).

The Jiangxi Soviet

The CCP was founded in the early 1920s. In 1924 the Guomindang agreed to form a united front with the CCP in return for Soviet aid. But in 1927, after successfully subduing warlords in the north, the Guomindang launched a bloody purge against all Communists in areas under the Guomindang’s control. Communist cadres were forced underground. In the early 1930s, the Communists had about fifteen bases in rural south-central China, but the purge had shattered their links with the central committee in Shanghai. The CCP, then led by a group of Moscow-trained Chinese students known as the Twenty-Eight Bolsheviks, depended heavily on support from the Soviet Union. In 1931 the central committee moved its headquarters from Shanghai to Jiangxi Province in northern China and declared the local government a soviet (an elected government council of the CCP). Mao’s ideology came to influence the Jiangxi Soviet, which was originally dominated by the Moscow-trained leaders, many of whom were defenders of the Soviet Union’s concept of revolution by urban workers. Mao believed that the revolution in China could be won with the help of the peasants, who made up the bulk of the population. Under the military threat of the Nationalists, the Chinese Communists ignored their Soviet advisers and forged their own tactics. Mao and his followers gained the support of the peasants by expropriating and redistributing land in the soviet region.
Between 1930 and 1934, the Nationalists launched a series of military campaigns against the Communists in an attempt to wipe out their bases. Using guerrilla warfare tactics developed by Mao, the Communists held off four campaigns. In October 1933, the Nationalists launched a fifth campaign. With guidance from German advisers, Chiang Kai-shek mobilized some 700,000 men who built a series of cement blockhouses around the Communist camps to barricade the soviet areas in Jiangxi. About a million people died because of the ensuing economic blockade and later military actions. The Communists switched tactics from guerilla warfare to positional warfare, the strategy of defending military bases. But against the better-armed Nationalist forces, the Communists suffered severe losses. By mid-1934, the Red Army, the name of the Communists forces at that time, was defeated and in retreat. Also in 1934, the Communist central committee removed Mao from CCP leadership.

Retreat

On 15 October 1934, 86,000 Communist military personnel, along with 30,000 party officials and civilian party members, broke through the blockade and fled westward. At first, there was confusion over the direction and leadership of the retreat. Eventually, Zhu De (1886–1976) and Zhou Enlai (1898–1976) assumed leadership, and Mao’s guerilla tactics were again employed. Along the way the Communists were frequently bombarded and attacked by the Nationalist forces and suffered great losses. The demoralized Communists reached Zunyi, Guizhou Province, in early 1935. While there, Mao gathered support from his followers and defeated the Soviet-trained faction in a session of the CCP Politburo, which, by chance, lacked a quorum. Mao became the actual leader of the Communist Chinese Party, a party now under complete Chinese control.

The Long March continued as the Communists proceeded toward Shaanxi. Mao’s Jiangxi contingent was later joined by the Second Front Army headed by He Long (1896–1969) from its base in Hunan, and the Fourth Front Army under Zhang Guodao (1897–1979) from its base in the Sichuan-Shaanxi border area. Following a power struggle between Mao and Zhang, Zhang moved his group toward southwestern China. Mao marched his troops toward northern Shaanxi, northwest China, where Gao Gang (1902–1955) had established a Communist base. Most of the route was mountainous, with few motor roads and resources. To maintain marching speed along the route, the Communists discarded their heavy equipment and even food and medicines.

Over the yearlong, 9,600 kilometer march, the Communist troops crossed eighteen mountain ranges and...
twenty-four rivers, averaging about twenty-seven kilometers (seventeen miles) a day. When the Long March started from Jiangxi, there were about 100,000 followers. Many new recruits joined along the way, but some left to mobilize the peasantry, some died on the way, and others simply abandoned the endeavor. By the time the march reached Zunyi in January 1935, 50 percent to 80 percent who had started out were lost. When these survivors finally reached Shaanxi in October 1935, only the leaders and a small number of the troops remained.

In mid-1936, the remnants of several Red armies gathered in northern Shaanxi and set up their headquarters in Yenan. By December the Red Army had grown to 30,000 men. The army, now secure and defended in the mountains and difficult terrain of Shaanxi, regrouped and planned its strategy against the Nationalists.

A Lasting Legacy

Perhaps the most significant outcome of the Long March was the ascendancy of Mao as paramount theorist and leader of the CCP. During this time Mao began to develop his unique version of Communist theory, which included a dramatic changes in party-mobilization policies. His views overrode the Soviet orthodoxy of an urban-based revolution and became the CCP’s strategy of establishing itself in the countryside. The Communists had gained much support from peasants along the route of the march. From then on CCP doctrine decreed that imported Marxism was less important to China than China’s unique history, culture, and economy. Mao believed that the Chinese Revolution should be led by the huge rural population, not the small number of urban workers.

The Long March helped launch the careers of new and strong national political leaders. Most of the later prominent leaders of the CCP—including Deng Xiaoping (1904–1997), Zhou Enlai, Liu Shaoqi (1898–1969), Zhu De, and Lin Piao (1906–1971)—participated in the march. After the establishment of the People’s Republic of China in 1949, these Long March veterans became top-ranking political leaders.

The establishment of the CCP’s new base in northern Shaanxi in 1935 had significant implications for Nationalist-CCP relations and for the War of Resistance against Japan (1937–1945, known outside China as the Second Sino-Japanese War). The base was surrounded by desert on the west and the Huang (Yellow) River on the east. Although the topography and the lack of motor roads in the region made Shaanxi a defensible area, a local shortage of food and other resources made the new base vulnerable to Nationalists attack. But when the war with Japan broke out, the northwest became an important strategic base from which a war of resistance was organized. The Long March had inflamed Chinese nationalism and inspired Chinese troops in the face of advancing Japanese armies. Ultimately, and most important, the Long March helped to transform and consolidate the Chinese Communist Party’s strength and influence inside and outside China.

Longmen Grottoes
Lónmén Shíkū 龙门石窟

In 494 CE work began on the rock-cut cave temples at Longmen, located approximately 14 kilometers south of Luoyang 洛阳 on the Yi River 伊河. With more than 2,300 caves and 100,000 statues and reliefs carved over a 250-year period, Longmen holds some of the finest examples of large-scale Buddhist carvings in China.

In 494, when the Northern Wei (386–534 CE) capital was moved 482 kilometers south from Pingcheng (near modern-day Datong) to Luoyang, work began on the rock-cut cave temples at Longmen. The cliffs at Longmen reminded the Northern Wei rulers of the ridge at Yungang, just west of their former capital, where previously they had sponsored a program of cave-temple construction. However, the stone at Longmen—a hard, closely grained, and dense limestone—was quite different from the sandstone at Yungang and allowed for more detailed carving. With more than 2,300 caves and 100,000 statues and reliefs carved over a 250-year period, Longmen holds some of the finest examples of large-scale Buddhist carvings in China.

Longmen is located approximately 14 kilometers south of Luoyang on the Yi River. Cliffs line both sides of the river bank, giving rise to its full name, Yique Longmen (Dragon Gates of the Yi River). The majority of the cave-temples are found on the north side. Inscriptions at the site attest to the wide range of donors, including emperors and empresses, members of the aristocracy, imperial eunuchs, local officials, and monks and nuns. The largest statue is 17 meters in height.

Activity at Longmen began under Northern Wei ruler Xiaowen Di (reigned 471–499) and continued almost without interruption until Luoyang was sacked in 755 during the An Lushan Rebellion. The Guyang Cave, conceived in 493 when the emperor decided to move the capital, is the earliest cave, and it, along with the Binyang Cave (begun in 505 under Xuanwu Di, reigned 499–515), follows iconography that reflects the early sixth-century interest in the Lotus sutra (Fahua jing) as the main teaching text for this popular form of Buddhism.

The most impressive sculpture at the site is the group found at the Fengxian temple, also known as “Cave 19.” Commissioned by Tang dynasty (618–907 CE) emperor Gaozong (reigned 650–683), work was begun in 672 and completed in 675. The central image of Vairocana (the Great Illuminator or Supreme Buddha, one of the Five Great Transcendental or Wisdom Buddhas popular during the Tang dynasty) is 17 meters in height, including the 4.5-meter pedestal. Vairocana is flanked on each side by his disciples, Ananda and Kasyapa; a bodhisattva (deity) in each corner; and two guardian figures on each side wall. Wu Zetian (625–705), who would become China’s only female ruler, was a devout Buddhist and contributed a large sum of money to the construction of this temple. Some believe that the facial features of Vairocana were modeled after those of Wu. Originally a wooden canopy covered these figures but is no longer extant, and only the
square holes in the rock where the timbers would have been inserted remain.

The site has suffered from weathering, vandalism, and looting over the centuries, beginning with the violent anti-Buddhist persecution of 845 under Tang dynasty ruler Wuzong (reigned 840–846). The worst damage occurred in the 1920s and 1930s when the publication of photographs of the statuary attracted the attention of unscrupulous dealers and antiquities collectors worldwide. Even so, Longmen remains as one of the most spectacular examples of Buddhist stone sculpture in China, particularly of the Northern Wei and Tang dynasties, and was named a World Heritage Site by the United Nations Educational, Scientific, and Cultural Organization (UNESCO) in 2000.

Chinese tradition often attributes inventions to a legendary person, and Lu Ban, based on a real person named Gongshu Ban (who lived late sixth to early fifth century BCE), is regarded as the creator of many of the tools of carpentry, such as saws, squares, and planes.

China has a tradition of attributing an invention or a series of related inventions to a deified or legendary person. Lu Ban is therefore worshiped as the originator of many of the tools used in carpentry in the same way that Cang Ji is venerated as the author of Chinese characters and Cai Lun the creator of paper.

The real person behind the consecrated Lu Ban was said to be Gongshu Ban (507–442 BCE). Lu Ban was simply his nickname meaning “Ban from the state of Lu.” He was either a skilled artisan or emancipated slave from the state of Lu in the Spring and Autumn Period (770–476 BCE). The great Confucian Mencius (372–289 BCE) gave Gongshu Ban, or Lu Ban, credit for inventing the first quchi (carpenter’s square). Many historical records claim that Lu Ban was also behind the invention of such tools and devices as the bao (plane), modou (ink marker), chi (ruler), ju (saw), zian (drill), shuan (bolt), xie (peg), chan (shovel), san (umbrella), lulu (windlass, a machine for hoisting and hauling), and shimo (millstone). These records include Gushi kao (Examination of Ancient History) by Qiao Zhou (201–270), Shiwu ganzhu (Of All Things) by Huang Yizheng (around 1601), and Wuyuan (Origin of Things) by Luo Qi of the Ming Dynasty (1368–1644).

Some of the contraptions are even associated with Lu Ban’s family members, suggesting that they had a part in their creation. For example, the little hook attached to the tip of the line from an ink marker is called a banmu (Ban’s mother), and the little fixture on a bench that catches a piece of wood while it is planed is named bangqi (Ban’s wife).

Many tales have been told about Lu Ban and his inventions. A textbook classic tells that one day Lu Ban was assigned to build a large palace in a limited time. The only tools available at the time were axes, which were very inefficient when it came to felling trees and separating timber into lumber. He was told that if he and his fellow workers failed to meet the deadline, they would face serious punishment, which usually meant decapitation. Worried, Lu Ban went to the mountain to oversee the loggers. He grabbed what he could lay his hands on to clamber up when something cut his fingers. Ignoring the pain and bleeding, the curious Lu Ban studied the object that had hurt him. The discovery of a serrated leaf of grass gave him an idea: A metal blade with notches and sharp projections would cut into wood as fast as the teeth of the leaf cut into his hand. And it would speed up lumbering significantly. Hence the ju (saw) came into existence. But not all Chinese believe in this tale. The ethnic Yao in China ascribed the creation of the ju to Yayou, a deity working for the Yao’s mother goddess, Miluotuo.

Deity of Artisans

The artisan deity Lu Ban, known also as Gongshu Pan or Kungshu Phan, is discussed by China scholar Joseph Needham in his seven-volume Science & Civilisation of China.

Just now we read Fu Hsuan’s reference to Kungshu Phan, the greatest of all the tutelary deities of artisans. In spite of the fact that much of what was handed down about him is clearly legend, there is no reason to doubt his real existence in the State of Lu (hence his other name, Lu Pan) in the 5th century, and we shall meet him from time to time in connection with kites and other devices. He lives in proverbs, for instance “brandishing one’s adze at the door of Lu Pan” (Lu Pan men chhien lung fu tzu), which is as much as to say, in our less elegant idiom, “teaching one’s grandmother to suck eggs.”

...Here is the place to mention a curious little work called the Lu Pan Ching (Lu Pan’s Manual), which circulated widely in the recent past among China’s craftsmen. As it seems not to have been studied by any sinologist, some descriptions of it may be appropriate. Its author or compiler, Ssucheng Wu-jung, and its editors, Chang Yen and chou Yen, are quite dateless, but much of its content is so archaic that one gains the impression of dealing with material some of which might well go back at least to the Sung. Anything so traditional will always be hard to date.

The book opens with a series of illustrations showing operations of constructional joinery, sawyers at work, and various kinds of houses, bridges and pavilions, partly built or completed… Then there follows, after a legendary biography of Kungshu Phan, a mass of detail about the cutting of timber in forests, the erection of pillars and the characteristic houses, furniture, the wheel barrow, the square-pallet chain pump, the piston bellows, the abacus and many other things. Precise specifications and dimensions are all interspersed with lore about lucky and unlucky days, samples of charms and appropriate sacrifices. As the book proceeds the magical element preponderates more and more over the technical, and thus at the end we find a “physiognomy” of buildings, directions for exorcistic and luck-bearing incantations, and descriptions of permanent protective cantrips. The whole work, therefore, which deserves serious study, constitutes a unique piece of traditional technology and folklore.

Zhongguo jian zhu yu wen hua shu xi. Beijing Shi: Hua wen chu ban she.

Lu Xun is the best known of modern Chinese writers both at home and abroad. A pioneer in the May Fourth Movement–inspired new literature of the early 1900s, he specialized in the short story, endowing this genre with new form and content. He also experimented with form, writing prose poetry and many volumes of satirical, combative essays known as zawen 杂文.

Born into a declining scholar-official family in Shaoxing, Zhejiang Province, Lu Xun (his real name was Zhou Shuren 周树仁; he was the older brother of Zhou Zuoren, a leading essayist and social critic) received a traditional education before entering modern-style schools in Nanjing. In 1902 he was sent to study in Japan on a government scholarship. He studied medicine for two years before switching to literature because he felt that only literature could cure Chinese people’s “spiritual illness.” As a writer, he would wield his pen like a surgeon’s scalpel to dissect this illness so that a cure might be found. Most of his best-known stories were devoted to the exposure of what was wrong with the Chinese society and the Chinese national character. His other literary endeavors included a study of the history of Chinese fiction and translations of Russian, East European, and Japanese writers.

His Fiction: Exposing China’s Spiritual Illness

“Diary of a Madman” (“Kuangren riji” 狂人日记), the first story Lu Xun wrote in the vernacular language, borrows its title from the Russian writer Nikolai Gogol and records a madman’s delusion that people all want to eat him. Beneath this pseudo-medical case of persecution complex, the story is a devastating indictment of traditional China as a cannibalistic society and traditional Chinese culture as a man-eating culture. On every page of Chinese history the Madman sees the words “Confucian virtue and morality,” but in between the lines are
the words “eat people.” After the Madman is cured he no longer has this strange vision and becomes an official. The implication of this story is clear: It takes a madman to see the truth and have the courage to tell it. In saying what the sane people dare not say, the writer is also a madman. Lu Xun gives his story a double structure: The fragmented diary has a preface written in classical Chinese by an implied author. The conventional values voiced in the preface form an ironic contrast to the Madman’s insight. To counter this gloomy view of Chinese culture, the story ends with a plea to save the children.

Closely related to the theme of cannibalism is the story “Medicine” ("Yao" 药), in which an executed revolutionary’s blood is used as “medicine” to cure consumption. A blood-soaked bun becomes a symbol of the ignorance and cruelty of the Chinese masses. The revolutionary who sacrificed his life for his countrymen is jeered by them as another madman. The futility of his sacrifice is further revealed when the two bereaved mothers meet in a graveyard—one whose son had taken the “medicine,” the other whose son had provided the “medicine.” The death of the two young men (whose surnames Hua and Xia 夏 stand for an old name for China) indicates Lu Xun’s pessimistic view of the Chinese revolution. The revolutionary’s blood cannot cure his benighted countrymen. The story “My Old Home” (“Guxiang” 故乡), based on a trip that Lu Xun took to his hometown, raises the question of the barriers between intellectuals and peasants. The first-person narrator’s fond memory of the happy and idyllic time that he shared with his childhood playmate Runtu 潦土 forms a sharp contrast to the invisible wall that now separates them. Runtu addresses the narrator as “Master,” and the two old friends face each other in awkward silence. Unable to bridge the social divide between himself and his peasant other, the narrator pins his hope on the future. In a note similar to the Madman’s plea to save the children, he hopes the younger generation will have a new life.

The story “New Year’s Sacrifice” (“Zhufu” 祝福) also features an intellectual first-person narrator and a peasant protagonist. Whereas Runtu’s physical and moral deterioration could be attributed to his hard life as a peasant, the tragedy of the peasant woman Xianglin Sao 祥林嫂 in this story is caused by the ignorance and superstition of the Chinese peasantry. Having lost both of her husbands and her young son, she is regarded as a cursed woman by the villagers and her employer. Her ostracism is so complete that even the harrowing tale of her baby being eaten by a wolf fails to elicit any interest, let alone sympathy, from her audience after her story loses its sensational appeal. Her repeated attempts to verbalize this shocking event in her life make her a laughingstock in the village. In despair, she turns to the narrator for enlightenment on what happens after a person dies. His well-meaning but evasive response fails to ease her torment. The story ends on an ironic note: Xianglin Sao is found dead just as the villagers prepare to celebrate the New Year. The woman they tormented to death symbolically becomes the “sacrifice” they offer to the gods to secure good fortune. The ineffectual intellectuals and suffering peasants portrayed in these two stories represent the two major themes of modern Chinese literature. The use of the mediating first-person narrator in these two stories is also an innovation not found in traditional Chinese fiction.

“The True Story of Ah Q” ("Ah Q zhengzhuan” 阿Q正传) is Lu Xun’s major work of fiction. In this so-called official biography (zhengzhuan) he adopts a mock epic structure to depict the physical needs and misadventures of someone from the lowest stratum of the Chinese society. Ah Q, whose real name Lu Xun professes not to know, is the Chinese Everyman. His ignorance, his cowardice,
his habit of bullying the weak and cowering before the strong, and a long list of other character defects represent the negative traits in the Chinese national character. His self-delusion in turning humiliating defeats into “moral victories” has given rise to the expression “Ah Q spirit”—a spirit that has also infected the Chinese people. Furthermore, his inability to defend himself against the village bullies parallels China’s inability to defend itself against foreign countries. In making this character a symbol of national affliction and national shame, Lu Xun fulfills his mission of exposing Chinese people’s “spiritual illness.”

His Prose Poetry: Self-Examination

In his prose poetry collections Wild Grass (Yecao) Lu Xun turns his critical examination to himself. He once remarked that he dissected himself even more harshly than he dissected others. The twenty-three poems in this collection show more affinity with Western modernism than with classical Chinese poetry in their evocations of the subconscious. Some of the pieces are lyrical, others symbolic and allegorical, and together they reveal a surreal world of eerie dreams and frightening visions. He told his wife that these works expressed the “darkness” and “nothingness” that he felt. In exposing his inner torment to public view, Lu Xun was unique among modern Chinese poets. For him writing was a form of probing the self and society.

His Essays: Social Satire

Besides being a spiritual doctor to the Chinese people, Lu Xun was a cultural warrior. His zawen (critical and satirical essays) were his weapon against his critics and enemies from both the right and the left. Disillusioned by the repressive Chinese Nationalist Party (Guomindang 国民党) regime, Lu Xun in his later years increasingly leaned toward the Communist cause. He was elected to a leadership position in the League of Left-Wing Writers, but he never joined the Communist Party. As a writer, he could not surrender his independence to party doctrines. He believed that good literary works cannot be produced by orders; he was also aware that the League did not produce any good works. Despite his reservations about leftist literature and his falling out with the Communist cadres who ran the League, he was canonized by Mao Zedong as “a great writer, a great thinker and revolutionary” (quoted in Hsia 1971, 29). The proletarian revolutionary literature needed a standard bearer of Lu Xun’s stature. However, Lu Xun’s legacy should rest on his literary achievements, not on the use of him for political purposes.

Lushan Conference
Lúshān Huìyì 庐山会议

The Lushan Conference (Plenum) was held in 1959 to discuss China’s Great Leap Forward, an effort to initiate projects to increase agricultural and industrial production. Although the Leap had some success, Mao Zedong’s policies were criticized, and the withdrawal of Soviet experts and natural disasters led to starvation and near economic paralysis. Despite this, the Leap is considered a catalyst for the Cultural Revolution.

The Lushan Conference refers to the Eighth Plenum of the Eighth Central Committee of the Chinese Communist Party (CCP) held in Lushan (Jiangxi Province) in July–August 1959. The main topic of discussion was the Great Leap Forward, which refers to the first three years of China’s Second Five-Year Plan (1958–63). The Leap was an effort to rapidly modernize and industrialize China by relying on its vast population and human potential. This plan broke with past Soviet industrialization practices under Stalin and contributed to the break between China and the Soviet Union.

The Leap built on the prior three stages of collectivization of Chinese agriculture: mutual aid teams followed by low-level agricultural producers’ cooperatives, and then, in 1955, by high-level agricultural producers’ cooperatives with one hundred to three hundred families. The move to high-level cooperatives, though in many ways voluntary, also produced dissent within party leadership and resistance by many peasants. Mao Zedong (1893–1976), who was both Chairman of the CCP and President of the People’s Republic of China (PRC), was among the strongest advocates of rapid, though voluntary, collectivization. Mao contended that the collectivization of agriculture not only could precede the mechanization of agriculture, but also would provide the conditions and resources necessary for the mechanization of agriculture.

The Leap had some success in creating structures for and initiating industrialization, water conservancy, irrigation projects and educational opportunities in the countryside. It created communes that united up to hundreds of high-level cooperatives and tens of thousands of people. The communes promoted collective labor, virtually egalitarian incomes within work units, as well as nurseries for children and canteens where people could eat their fill—in part to free up women for social labor. The Leap also mobilized millions of peasants to build backyard steel furnaces to produce steel for local needs. Additionally, by pressuring communes to outperform each other, the Leap attempted to increase significantly agricultural production, but overall the efforts described here never achieved their goals and to some degree had serious negative consequences.

As early as February–March 1959, many of the errors of the Leap were becoming apparent. In his speeches in early 1959, Mao supported the overall direction of the Leap while calling for moderation in many aspects, for example: not eliminating wage differentials or equalizing wages at this time; underreporting, rather than over reporting, production to allow some leeway in planning; maintaining ownership at the brigade rather than commune level.
thus pre-empting “leveling” between units; and allowing
more time for analysis before moving forward with
the Leap (Mao ... wansui [1967–69] 1974). But Mao was
subjected to significant criticism, and in April 1959 he re-
signed as president of the PRC, ceding the position to Liu
Shaoqi. Mao maintained his position as chairman of the
party until the position as president was abolished in 1968
with Liu’s disappearance during the Cultural Revolution.
In 1970, shortly prior to his death, Lin Biao advocated
resurrection of that position (for himself).

When the Lushan Plenum began in July 1959, the Leap
was at the head of the nation’s agenda. At the Plenum, Min-
ister of Defense and long-time Communist revolutionary
Peng Dehuai wrote a letter to Mao strongly criticizing the
Leap, Mao, and what Peng called “petit-bourgeois fanati-
cism” (Qui Jin 1999). Mao accepted many criticisms of the
Leap and criticized his own role in contributing to the
errors of the Leap, acknowledging his own responsibil-
ity for the unrealistic goal of producing 10.7 million tons
of steel (and the associated backyard steel furnaces) and
for propagating the communes. Yet he continued to argue
that the Leap was positive; he suggested moderating cer-
tain aspects—such as allowing the weak communes to
fail rather than maintaining them all (as leftists proposed)
or eliminating them all (as rightists proposed)—and en-
couraged more efficient planning. Mao called for others
to take responsibility for their roles in establishing the
goal for steel production, promoting the communes and
helping to undermine state planning. Perhaps more sig-
nificantly and somewhat contradictorily, Mao argued that
Peng’s criticisms were not just errors of judgment by a
comrade, but rather demonstrated that Peng was acting
as an enemy of socialism. But Mao gave no clear crite-
ria for what made these criticisms an attack on socialism.
The lack of criteria subsequently created significant prob-
lems in the Cultural Revolution in that much of the chaos
resulted from the fact that individuals were denounced
based on having “capitalist thoughts” or “opposing Mao”
despite the fact that Mao’s Thought had contradictory
elements and that no clear criteria of what constituted
socialist or communist were ever established.

As a result of Mao’s criticism following the Lushan
Conference, Peng Dehuai was removed from his position
as Defense Minister and replaced by Lin Biao (who be-
came Mao’s closest “comrade-in-arms” during the early
part of the Cultural Revolution until he died in 1971,”
ally fled after leading a coup attempt against
Mao). But many officials who agreed with Peng remained
in high-level positions within the party. In 1962, Liu Sha-
qo tried to reverse the dismissal of Peng, and Peng him-
self wrote an 80,000-character letter requesting a reversal
of the verdict. Several years later, Wu Han, a vice mayor
of Beijing, wrote a play entitled Hai Rui Dismissed from
Office, as an allegory to call for Peng’s reinstatement. The
critique of this play was one of the opening salvos of the
Great Proletarian Cultural Revolution. Peng was jailed
and mistreated in prison, dying without public acknowl-
dgment in November 1974. In 1978 the CCP reversed
the verdict on him.

Despite modifications to the Lushan Conference,
the Leap continued. Many communes exaggerated
their grain output to get recognition as outstanding
supporters of the Leap, the result of which was that the
state collected excessive grain as taxes, leaving inade-
quate amounts of food and seed. By late 1959 and early
1960, the situation in the countryside became quite
dire, which was exacerbated by other factors. The So-
viet Union broke relations with China and in July 1960
withdrew its technical experts, blueprints, and aid. This
was due in part because of disagreements over foreign
policy and in part because of significant differences over
the nature of socialism and communism. In addition,
drought and floods in many parts of China from 1959 to
1962 made the situation even worse. As a result, during
“The Three Bad Years” (1959–1962) it is estimated that
up to thirty million people died of starvation. Mao was
pushed to the sidelines and less radical policies, associ-
ated with President Liu Shaoqi and party general secre-
tary Deng Xiaoping, were implemented. These policies
helped to resuscitate China’s economy to a significant
degree; however, they also allowed increasing inequality
and corruption throughout China. In Mao’s eyes, these
policies increased the gap between the leaders and the
masses and began to sow the seeds of capitalism. This
perception was a key to Mao’s call in the mid 1960s for a
radical remaking of China’s communist revolution and
the overthrow of Liu Shaoqi, Deng Xiaoping and others
as capitalist roaders in the party.

In many ways the Lushan Plenum set the stage for
the Cultural Revolution. Mao’s criticism of Peng was
a harbinger of his argument that class struggle contin-
ues under socialism. Although criticized by many as a

© 2009 by Berkshire Publishing Group LLC
deviation from Marxism and Leninism, the notions of the continuation of class struggle under socialism and the need for continuous revolution were key elements of the Cultural Revolution. The struggle for Peng Dehuai’s rehabilitation, the characterization of the Leap, and the subsequent period under the leadership of Liu Shaoqi and Deng Xiaoping were integral to the Cultural Revolution.

Mǎ Yīnɡ jīǔ 马英九

b. 1950 President of Taiwan (2008– )

Elected president of Taiwan in 2008 after having served as mayor of Taipei, Ma Ying-jeou has become very popular, particularly with young people, for his stands against corruption and for working toward improving the international status of Taiwan as well as economic relations with mainland China.

During Taiwan’s 2008 presidential election campaign, Kuomintang (KMT) candidate—and eventual winner—Ma Ying-jeou was often dubbed “Taiwan’s Obama” by the Taiwanese media because of his ability to mesmerize youthful voters at campaign events. Like Barack Obama, he attended Harvard Law School. Ma, at 58, is young by Chinese political standards; he is tall, physically fit, and photogenic. He also has a reputation as a “clean” politician who had run a popular administration as the elected mayor of Taipei, Taiwan’s capital city. Ma stood out at a time when Taiwan’s national politics were clouded with near-daily accusations of corruption, known as “black gold” politics. Ma is the son of a prominent KMT official from Hunan province in China who had served under Chiang Kai-shek. Ma’s father followed Chiang to Taiwan. Ma himself was born in Hong Kong on 13 July 1950.

A bright student, Ma graduated from the prestigious National Taiwan University in 1972 and then came to the United States to study law, first at New York University, where he received a master of law degree, then at Harvard Law School under the tutelage of Jerome Cohen, the renowned scholar of Chinese law. Ma received his doctorate of juridical science degree from Harvard Law School in 1981. He speaks flawless English.

Because the old KMT had become very corrupt, Ma attempted a major reform as the party’s first elected chairman from 2005 to 2007, focusing on matters such as curtailting bribery. Then, after he decided to run for the presidency, he concentrated on formulating his own campaign. He was elected president by a landslide in March of 2008 for a four-year term ending in 2012. Ma won 54.5 percent of the vote, compared with the Democratic Progressive Party (DPP) rival Frank Hsieh’s 41.6 percent, winning by more than 2.2 million votes. Under Taiwan’s constitution, Ma is permitted to run for a second four-year term should he choose to do so.

President Ma has stated three major policy goals: 1) to improve relations with both China and the United States, 2) to revive Taiwan’s sluggish economy, and 3) to improve Taiwan’s international standing. In respect to his first goal, Ma immediately sent his vice president—elect Vincent Siew to China and negotiated...
Ma Ying-jeou, the current president of Taiwan, is a member of the Kuomintang, Taiwan’s Nationalist party. He is often called “Taiwan’s Obama” by the Taiwanese media.

with Chinese president Hu Jintao at the Boao Forum for Asia held in Hainan, China, 11–13 April 2008. Former U.S. secretary of state Colin Powell, who also attended the Boao Forum, remarked that the Hu–Siew meeting was “very good news for the region,” and that “the two sides now have begun down a new path.” As for revitalizing the economy, Ma specifically stated that he wanted to increase economic ties with the mainland by opening Taiwan to direct tourism and encouraging investment across the Taiwan Strait. He also stressed that he wanted to avoid using war as an instrument of policy. Finally, he has sought to improve Taiwan’s international stature with China’s support rather than following his predecessor’s adversarial approach, which had antagonized China and had only resulted in fewer nations recognizing Taiwan’s government diplomatically. Ma personally received a special senior envoy from China, Chen Yun-lin, Chairman of China’s ARATS (Association for Relations Across the Taiwan Strait) on 6 November 2008, in Taiwan’s official guest house in Taipei amidst massive protests by DPP members.

On 20 December 1999 the former Portuguese-administered territory of Macao (Aomen) reverted to Chinese rule. After Hong Kong, Macao became the second Special Administrative Region of China governed by a Basic Law or mini-constitution. The Macao Basic Law underwrites a high degree of autonomy but differs with its Hong Kong counterpart on details especially relating to local history and culture.
Importantly, Chapter 1 (5) of the Basic Law states that the “previous capitalist system and way of life shall remain unchanged for 50 years” (Basic Law). Although maintaining a high degree of autonomy, the Macao SAR is short of being an independent jurisdiction, especially because Beijing retains control over foreign affairs and defense. Even so, Macao is party to a range of international conventions, organizations, and agreements under the “Macao, China” name with the concurrence of the central government.

Under the Basic Law Macao retains its Portuguese legal system and retains Portuguese as an official language alongside Chinese. The Macao SAR reserves independent judicial power with the right to final adjudication. Freedom of speech, habeas corpus (a writ inquiring into the legality of the restraint of a person who is imprisoned), freedom of conscience, and religious freedom are all upheld. The Basic Law underwrites the interests of people of Portuguese descent, a reference to the Macanese or Eurasian component of Macao society.

Certain economic practices in Macao are also secured, namely the maintenance of the pataca currency, along with free port status. Macao’s casino industry, the major prop of the local economy, is not specifically mentioned in the Basic Law, but Beijing has sanctioned the industry in separate discussions.

Although the presence of the People’s Liberation Army in Macao was not expected to be required, the presence was conceded by Portugal after an outburst of triad-based (Chinese underworld) violent crime, which—mysteriously—abated after the handover.

The Basic Law provides for a Legislative Council term of four years with powers to introduce bills and pass legislation. Currently the council has twelve elected members,

---

_Evidence of Portuguese culture and style is still visible in many areas of Macao._

_PHOTO BY JOAN LEBOLD COHEN._
ten indirectly elected members, and seven appointed members. The method for forming the council can be changed with support from a two-thirds majority with the consent of the chief executive. In turn, the central government reserves the right to appoint or remove the chief executive, currently Edmund Ho Hau-Wah serving out his second five-year term.

Although the Basic Law is silent on the question of full democracy, it remains to be seen whether civil society support for a fully elected legislature will gain momentum as in Hong Kong. Nevertheless, Macao residents have actively canvassed for good governance, especially as the casino-driven economic economy has created income disparities. High-level corruption in Macao has also incurred the displeasure of the central government.

Macao—History

Àomén lishì 澳门历史

520,400 est. 2007 pop.

Macao, one of two special administrative districts in China, began as a Portuguese colony in 1557 and became the center of Sino-European trade. In 1999 Portugal returned Macao to China. Today Macao is one of the most densely populated places in the world and the only place in China where gambling is legal.

Regardless of the reason, the territory became an important base of operations for Portuguese merchants in East Asia. Reporting to authorities in Goa, India, the Portuguese governor in Macao oversaw a vibrant trade with the Ming dynasty (1368–1644) and later the Qing dynasty (1644–1912), and his city was an important headquarters for the Jesuit missionary movement in East Asia.

Other European powers, especially the Dutch, were jealous of Portugal's position in Macao, and several times Macao had to defend itself from attacks by the Dutch East India Company. The colony did shelter the families of English and Dutch merchants who were involved in the China trade at Guangzhou (Canton) 100 kilometers to the north. Regulations there prohibited merchants from residing permanently in the city and family members from accompanying them on trading missions. In 1635, with the expulsion of all foreigners (except for a few Dutch traders) from Japan, Macao became the center of Sino-European trade until the end of the eighteenth century.

After the First Opium War (1839–1842) was fought and four new ports opened to foreign trade, Macao suffered a decline in its importance as a point of commerce on the China coast. However, the Portuguese remained in Macao, although much of the trade with the Qing dynasty moved to Shanghai and Hong Kong. In 1845 João Ferreira do Amaral, governor of Macao, ended the practice of paying the Chinese an annual rent of five hundred silver taels and evicted Chinese customs officials from Macao. In 1887 China and Portugal signed a treaty that recognized Portuguese sovereignty over the colony. Although Macao was now a foreign-controlled possession on the China coast, Macao’s importance continued to decline.

The territory of Macao (Macau or, as it is known in Chinese, Aomen) in southern China was a Portuguese colony for more than four centuries (1557–1999). The territory consists of a narrow peninsula in southern Guangdong Province and the islands of Taipa and Coloane. Its population, combined with the territory’s small area (23.5 square kilometers), makes it one of the most densely populated places in the world.

The Portuguese name Macao possibly was derived from either the Ma Kwok (Cantonese) temple that has stood in the city of Macao since the fourteenth century or the Cantonese term Ama-ngao (Bay of the Goddess A Ma, the patron of sailors and fishermen). The Portuguese settled Macao in 1557 and named the site "Provação do Nome de Deos na China" (Settlement in the Name of God in China). Scholars do not know why Chinese authorities let the Portuguese establish a colony. Possible explanations are that the territory was small and of little value and that the presence of the foreigners would encourage trade or that the Portuguese were being rewarded for their perceived assistance in driving away local pirates.
as Hong Kong’s grew. During World War II in Asia and the War of Resistance against Japan (1937–1945) Macao experienced a short revival as a safe haven because of Portuguese neutrality.

The governments of China and Portugal in 1987 concluded negotiations for the return of Macao to Chinese rule on 20 December 1999. Macao is governed by a Basic Law (miniconstitution), which underwrites a high degree of autonomy. Under the Basic Law Macao retains its Portuguese legal system and retains Portuguese as an official language alongside Chinese.

The return of Macao to the “motherland” was an important occasion for the leadership in Beijing and for many other Chinese. The return of the last of the foreign-controlled territories to Chinese rule—like the earlier return of Hong Kong by England in 1997—ended almost two centuries of unequal treaties that were a source of humiliation for many Chinese. The return also signified that a new, stronger China had at last come of age as an equal player on the world stage. China hopes that successes in the Hong Kong Special Administrative Region and Macao Special Administrative Region under the “one country, two systems” banner will pave the way for the reunification of the People’s Republic of China and Taiwan.

The Macao Special Administrative Region economy features trade, the local fishing industry, and some light manufacturing, but tourism and gambling predominate. Gambling is illegal elsewhere in China but permitted in Macao, where Chinese tourists represent 70–80 percent of Macao’s casino visitors. During the mid-1990s the colony was plagued by violence as Chinese criminal gangs, or triads, from Hong Kong moved into Macao before the return of Hong Kong. These gangs battled for control of the colony’s gambling establishments, drug trade, and prostitution. The Macao Special Administrative Region continues to be a popular holiday destination for residents of Hong Kong, and its economy is being more closely integrated with that of the neighboring Zhuhai Special Economic Zone.

China changes constantly, and the Encyclopedia of China will change and grow, too. Berkshire’s authors and editors welcome questions, comments, and corrections: china.updates@berkshirepublishing.com.
China’s machinery and equipment industry, now one of the world’s largest, has undergone many ups and downs since its beginnings in the 1860s. Several wars and the Cultural Revolution (1966–1976) caused downturns in production, while the onset of Mao Zedong’s Great Leap Forward in 1958 caused a spike in production at the cost of quality. Today it is the second largest industry in the country.

China’s machinery and equipment industry has grown from three government-sponsored military factories established in the 1860s to become the second largest industry in the country. It generated profits of US$22.5 billion in 2004 on total output of US$395 billion, contributing 16.2 percent of the country’s industrial gains. Ranked fourth in the world, the machine-building industry is one of the main locomotives behind China’s impressive economic growth.

History of Development

By 1933, China’s machine industry included 226 machine-building factories, 63 plants for manufacturing electrical equipment, and 34 shipbuilding and locomotive repair plants, all of which accounted for 2 percent of China’s total industrial gross output. Japan, which occupied Manchuria and north China from 1931 to 1945, expanded the industry substantially to support its war effort. By 1940, the number of machine factories had more than tripled to 968.

Interest in mechanical engineering grew during the War of Resistance against Japan (1937–1945, known outside China as the Second Sino-Japanese War). The China Mechanical Engineering Society was established, and engineers began experimenting with materials, internal combustion engines, and substitute fuels in the simple laboratories of the National Bureau of Industrial Research. In the interior areas under the control of China’s nationalist Guomindang government, private industrialists and the state combined efforts to build many machine factories. Unfortunately, only 77 remained in operation by 1947.

Production was disrupted in 1945 when the Soviet army occupied Manchuria and dismantled half the machine factories. From 1946 to 1949 civil war between the Guomindang and the Communists created further disruptions, and by the founding of the People’s Republic of China in 1949, the machinery industry accounted for only 2.7 percent of total gross industrial output, a minimal increase from 1933.

In its early development plans, the Communist government gave the machine-building industry high priority, acknowledging its importance for national defense and technological advancement. By 1952, pushed by the needs of the Korean War (1950–1953) and aided by Soviet technical assistance, the machine industry had recovered to its 1947 level. In its First Five-Year Plan (1953–1957), the state allocated 2.6 percent of total investment in industrial capital (RMB16.9 million) to machine building. Imports
of machinery and transport equipment were encouraged. But the Western policies of isolating China limited it to importing technology from the Soviet Union and Eastern Europe.

In 1956, China ratified the Long-term Program for Science and Technology to encourage the development of precision machines, jet engines, and other high-performance equipment. The Ministry of Mechanical Industry established academies and institutes on its own and in partnership with universities. In 1958, the Soviet Union signed an agreement to aid China in major scientific research projects, including the design and manufacture of large-scale equipment, precision machines, and precision instruments. From 1950 to 1965, China sent more than 16,000 students to the Soviet Union and Eastern Europe for training.

The launch of the Great Leap Forward in 1958 led to a sharp rise in machinery production, but much of it was unusable because quality had been sacrificed in the frenzy to increase domestic output. By 1960, imports of machinery and transportation equipment reached a peak of US$840 million. Nevertheless, the disaster of the Great Leap Forward, coupled with the withdrawal of Soviet assistance after the breakdown of relations in the early 1960s, created a setback from which the industry took years to recover.

With Soviet ties severed and imports at a low of $100 million in 1965, China turned to advancing its science and technology on its own. Engineers focused on developing high-quality equipment and digesting the technology earlier imported from the Soviet Union and Eastern Europe. But progress was slow. During the 1950s, the machinery industry had applied more energy to manufacturing products and equipment than to research and development. This meant that basic technologies and machining techniques remained backward.

Nevertheless, the machine industry continued to grow. The value of its output reached RMB¥9.7 billion in 1965, more than doubling its 1957 value of RMB¥3.5 billion. And in 1966, it contributed 12 percent of total gross industrial output. By the early 1970s, China was producing high-precision machine tools, large equipment such as 30,000-ton hydraulic presses, 300,000-kilowatt hydro-power generators, oil-refining equipment, and fertilizer production equipment.

The outbreak of the Cultural Revolution (1966–1976) brought scientific research to a halt. Government agencies were paralyzed, universities and colleges were shut down, and many scientists and technicians suffered persecution. Imports of advanced technology stopped. But in 1972, with the PRC’s admission to the United Nations and the establishment of diplomatic relations with Japan and a number of Western countries, technical imports from advanced capitalist economies began. In 1973, imports of machinery and transportation equipment from

Heavy machinery plant in Beijing. In the early days of the People’s Republic of China the Communist government gave the machine-building industry high priority. Photo by Joan Lebold Cohen
noncommunist countries reached US$501 million, or 63 percent, surpassing for the first time those from Communist countries (US$296 million).

**Modern Development**

China's technical imports accelerated after economic reforms began in 1978. The industry had focused on the industrial and defense sectors in the past but now paid more attention to the agricultural and consumer goods sectors. Emphasis shifted from importing complete sets of equipment to importing single techniques, and from building new enterprises to updating existing ones. Advanced technologies were imported through joint ventures, wholly foreign-owned enterprises (legal since 1980), and cooperative enterprises. With the increase in advanced imports and joint ventures, China's mechanical products and technology improved. The industry acquired numerical-controlled machine tools and industrial robots. By the late 1980s, 85 percent of China's mechanical products were being produced domestically. By 1996, there were nearly 5,300 officially approved foreign-funded ventures, with a total direct investment of approximately US$5.5 billion.

The industry grew at an average annual rate of 16 percent from 1984 to 1989, and 24 percent from 1990 to 1995. Growth slowed to 10 percent in 1997 and again in 1999. But China's overall economy experienced phenomenal growth in the early twenty-first century. Real gross domestic product rose by 9.5 percent annually from 1990 to 2004. China's expanding industrial sector provided the fuel for much of that growth. And as manufacturing grows, so does the need for machinery. In 2007, the output of China's machinery industry grew by 32 percent to a record high of RMB¥1 trillion (US$146 billion), according to the China Machinery Industry Federation (CMIF). It was the fifth consecutive year that growth surpassed 20 percent. China had succeeded in transforming itself from a net machinery importer to a net exporter.

Considerable technological advancement has been accomplished through imports and indigenization. Advanced manufacturing methods have been widely adopted in areas such as casting, forging, welding, heat treatment, and surface protection, while microelectronic technology has been spreading along with the Computerized Integrated Manufacturing System.

A significant portion of China's growing share of world trade can be attributed to the machinery and equipment industry. In 2004, total imports for the country reached US$561.4 billion, and exports climbed to US$593.4 billion. The machinery sector accounted for 45 percent of this trade. Machinery imports rose 31 percent in 2004 and exports 42.9 percent, according to the Ministry of
Commerce. Overseas trade in machinery and transportation equipment surpassed all other sectors except manufactured goods.

**Strengthening and Innovation**

In 2003, the government recognized the need to reinvigorate China’s traditional industrial “rustbelt” of the northeast. The three northeastern provinces of Liaoning, Jilin and Heilongjiang produced China’s first steel, machine tools, locomotives, and planes after 1949. But many of the state-owned machine factories there became outdated and less competitive after China shifted away from a planned economy. The government responded in 2003 with a plan to open the aging state-owned industries to private investment. The importance of this move to the government could be seen in the proportion of investment. In 2004, US$486.2 billion was invested in the northeast area, according to the National Bureau of Statistics, a far larger sum than the US$182.8 billion spent in the central region or the US$166.1 billion that went to the west.

The importance of strengthening the industry was also reflected in the spending of two of the country’s top machine-tool manufacturers, both located in Liaoning province. Dalian Machine Tool Group invested US$65 million in an upgrade that is expected to bring annual sales of US$1.2 billion in 2010. Shenyang Machine Tool Company spent approximately US$67 million on a new production line and another US$107 million on upgrading its factory to generate sales of nearly $750 million. Moreover, both companies have moved operations into Germany, one of the world’s top machine-building countries, giving them access to highly sophisticated technologies.

Clearly, China is building a significant machine and equipment industry, with its top enterprises making inroads into European and U.S. markets. And the industry is striving for innovation. According to the CMIF, the industry has bolstered its innovative capacity in the agriculture, construction, and power sectors with the development of a number of domestically produced, high-end equipment, such as cranes. Research is also under way on an electricity transmission project that is expected to produce the highest voltage, longest transmission distance, and highest transmission capacity in the world. Creative breakthroughs are also being made in energy-saving pollution-reduction equipment, infrastructure equipment, and high-end digital-control machine tools, the CMIF reported.

In a country with a long history of printing, it is somewhat surprising that magazines in China have been around for only slightly more than a hundred years. The development of magazines was slow during most of the twentieth century. But since the 1980s, magazines, like other mass media in China, have been growing to meet people’s demands.

Newspapers have a long history and deep influence in China. Magazines, on the other hand, are a more recent medium. The publication and distribution of magazines—including consumer publications, trade periodicals, and academic journals—has progressed slowly since the late nineteenth century. Not until the late 1980s had China begun to develop what might be called a magazine industry to complement the overall growth of mass media in the country. Magazines—both print and electronic—written in Chinese languages and published in the People’s Republic of China for Chinese readers are more diverse and popular than ever.

First Titles

The first Chinese-language magazine, in the modern sense of the word, was launched on 15 August 1815 when British missionary William Milne (1785–1822) founded Chinese Monthly Magazine in Malac. The publication ran from 1815 to 1822 and focused mainly on missionary affairs and ethical issues. In Guangzhou in 1833, Karl Friedrich August Gutzlaff (1803–1851), a German missionary, published Eastern Western Monthly Magazine, considered the first Chinese-language magazine published inside China.

Attempts to create magazines by Chinese publishers began in the 1880s. Even then, publishing was a risky business. It was not until the late 1890s, during the so-called Hundred Days Reform—a failed attempt at political, cultural, and educational reform in the Qing dynasty (1644–1912)—that periodicals arose. One of the most influential periodicals of the time was the Contemporary News Journal (Shiwu Bao, 旬刊) founded in Shanghai. Liang Qichao was the chief editor. He is known for his 70,000-word article calling for reforms that ran in twenty-one consecutive issues of the magazine. In 1904 Oriental Magazine was launched by a commercial print company. A general-interest publication, Oriental Magazine had the longest run of any Chinese magazine before the creation of the People’s Republic of China.

Twentieth Century

Politics was the prime subject matter for periodicals in the first half of the twentieth century. The first magazine issued by the Central Committee of Chinese Communist Party was Guidance Weekly, which came out in 1922, only one year after the formation of the party. In the 1930s and 1940s, such titles as the Liberation Weekly, Military and
Politics in No. 8 Route Army, China Youth, China Worker, and the Illustrated Journal in Jin-Cha-Ji Area appeared.

Several cultural journals also appeared during this period, including Life Magazine managed by Zou Taofen (1895–1944), a Chinese correspondent, political commentator, and publisher, and The Observer organized by Chu Anping (1909–1966?), a Chinese scholar, intellectual, and noted liberal journalist. Chu went on in the 1950s to edit the Guangming Daily (Guangming Ribao), a newspaper still being published.

After the founding of the People’s Republic of China in 1949, the publishing industry underwent an overhaul resulting in the creation of many new publications. By 1956 the number of known periodicals had reached 790, most covering political ideology and Chinese culture. Some of the most influential periodicals in the 1950s and early 1960s were the political news magazine Study, the popular mass media magazine China Youth, and the academic journal Philosophy Research.

Magazine publishing—along with many other political, cultural, and educational enterprises—came to a crashing halt during the Cultural Revolution (1966–1976). In 1970 only about twenty-one magazines were still being published.

New Issues

The all-important Third Plenary Session of the Eleventh Central Committee of the Chinese Communist Party in December 1978—a turning point in Chinese history that led to the opening of China—called for not only economic reform but also intellectual and educational reform. The search for truth to support Marxist ideology shifted from pragmatism, such as professors working on farms with the peasants, to a more modern scientific approach. These types of ideas helped the magazine industry to revive, retool, and remain strong up to the present.

By 1978 some 930 magazines were being published; by 1988, more than 6,000. The industry enjoyed a growth spurt in the early 2000s. By 2007 there were 9,468 magazines generating about 17 billion yuan ($2.5 billion) a year. Advertising sales in magazines have continued to grow as well. In 2007 revenues reached 3 billion yuan ($439 million).

Magazine Genres

The types of magazines in China, as in the United States, are quite diverse. And, as in the United States, the number of e-zines is on the rise and taking their place alongside traditional printed periodicals. The Chinese State Press and Publication Administration classifies magazines published in China into seven major categories although there are a number of subcategories as well. In American publishing these are known as consumer, or popular, magazines. Following are the major categories along with some representative titles: general interest (City Weekend), social science (Global Weekly), science and technology (Newton: Science Online), culture and education (EduBridge), art and literature (Sounds of Rain), children’s (Comics World), fashion (Rayli), and pictorial (People’s Photography). These consumer magazines are for the general public, with a few exceptions. They focus on information, entertainment, and readability, and usually include photos or illustrations and advertising. Their circulation is high and their price low.

In addition, China's magazine industry includes three categories of specialty publications. Vocational journals (known as trade publications in the United States), such as Electronic Products China, report on the latest markets, products, and business management practices for a specific industry or profession. Most of their revenue comes from ads and sponsorship. Their circulation and price are comparatively low. Academic journals, such as Progress in Natural Science, are mainly academic papers and research reports. They focus on certain fields and specific readers. They have a small circulation, higher price, and few, if any, ads. Even more specialized are digests and catalogues that offer concise and updated information, literature citations, abstracts, and indexes based on the editing of vast databases. Their subscribers are largely organizations, companies, and libraries. Compared with the other specialty publications, their circulation is small and their price high.

Industry Challenges

Having achieved some success, the magazine industry has become aware of the need for industrial development. The
industry faces a number of challenges if it wants to build and maintain readership.

Most domestic magazines still fail to operate under the principles of a market economy and have not established a modern enterprise system. Some magazines rely heavily on local administrative power, and their circulation is largely limited to the administrative system or grassroots units. Many are more or less institutional organizations without an entrepreneurial approach. They stay far away from the market, thus hindering the development of a competitive market mechanism and depriving themselves of economic returns.

In addition, there is a lack of authoritative statistics concerning circulation and advertising revenue and an inadequate system of archiving and record keeping. It is difficult for a new magazine to obtain serial numbers from regulators, which hinders its development. Furthermore, even though there may be a large number of magazines on the market, material is limited. Magazines of a similar genre cover the same content. And only a few magazines have risen above the others to influence thought, culture, or the market. Finally, a scarcity of knowledgeable publishers and business managers and talented editors and writers prevents the industry from achieving higher status.

Positive Prospects
But in response to the steady development of China’s economy and the rise of disposal income for the average Chinese citizen, the central government has attached great importance to cultural development and prosperity; thus periodicals—print and electronic—have a promising future. The government has established regulations for the periodical market in order to be fully prepared for international challenges. A government-sponsored program gives priority to those influential periodicals enjoying favorable sales and good reputation.

The market for magazines, and all other mass media, in China is expanding. The market is China’s growing numbers of readers and Internet users with time and money who are demanding more illuminating, meaningful, and personalized material from their mass media providers. If the magazine industry adopts a market-driven strategy, it is bound to prosper.

The phenomenon of magnetism was discovered in ancient China. That discovery led to development of the compass in China. By the eleventh century the compass was in use in navigation and would be a tremendous aid to ocean-going vessels.

The discovery of magnetism and the development of the compass were among the greatest Chinese contributions to physics. Although references to magnetism in Chinese sources do not date before the third century BCE, knowledge of the phenomenon clearly was widespread by that time, and experiments were being conducted and documented by the first century CE. Many early lodestone (the mineral magnetite possessing polarity) devices existed, such as the “south-pointing spoon” of the first century CE (which may have been invented a century earlier), and there exist several intriguing references to the use of magnets to make “automatic” chessboards.

However, magnetism seems to have been used mainly in geomancy (divination by means of figures or lines or geographic features) until the tenth century. Geomancy (feng shui) was concerned with configuring human dwellings to harmonize with spiritual forces that inhabit them.

Sculpture depicting an early Chinese invention: the magnetic compass. The spoon-shaped needle is also called a lodestone, made from ferrites (magnetic oxides).
Chess and Magnetism

This excerpt from Thai-Phing Yu Lan, ch. 988 is followed by a discussion by China scholar Joseph Needham explaining that very early uses of magnetism can be found in the game of chess.

Take the blood of a cock and mix it with iron (filings) from the grinding of needles, pounding it will lodestone powder. In the day-time, put the paste on the heads of chess-men (chhi) and let it dry in the sun. Then put them on the board and they will constantly bounce against and repel one another.

Several things are noteworthy in the above. Exactly how it was that the magnetized chess-men were “animated” is not clear; they may have been lodestone balls with iron underneath the board, or some of them may have been lodestone while others were iron. Powdered magnetite would have little attractive power. The connection with needles is interesting, and suggests that the demonstration of polarity using needles may really have been older than we thought. But in any case the important thing is the association of the magnet with the men or pieces used in divinatory proto-chess.

The fact that knowledge of the compass was reserved for imperial magicians greatly limited its spread, and for many centuries the compass apparently served only as a tool for divination. Even after the compass passed into more general use, the primacy of river and canal traffic slowed the spread of the compass to ocean-going vessels. Nevertheless, many improvements and adaptations occurred in the form of compasses, culminating in their use in navigation by the eleventh century.

Two of the most important developments in the evolution of the compass were the use of a needle rather than a lodestone or piece of metal and the discovery of magnetic declination (the deviation between true or geographic north and the direction that a compass needle points). The magnetization of needles was an important step in the evolution of the compass because needles could float or be suspended by a thread and rotate with a great degree of freedom. Also, steel remains magnetized longer than iron, and it was relatively easy at an early date for people to make small needles of steel; compasses with steel needles could be used on long voyages. Steel came to China from India during the fifth century, but the Chinese quickly began to produce their own supplies. Evidence suggests that magnetized needles were used as early as the fourth century CE, and their superiority in the construction of compasses was quickly appreciated.

The discovery of declination also occurred relatively early, sometime between the seventh and tenth centuries. Although the influence of nonscientific divinatory practices was clearly prominent in the development of the compass, much research went into magnetism from the fifth century on.

Manchu

Manzú 满族

The Manchus are the second largest (after the Zhuang) of China’s fifty-five official ethnic minority groups, numbering around 10 million people (2000 estimate). They overthrew the Ming dynasty (1368–1644) to establish China’s last imperial era, the Qing dynasty (1644–1912).

The Manchus (or Man) are a minority people who ruled China as the Qing dynasty (1644–1912). They are concentrated in the northeastern provinces of Liaoning, Jilin, and Heilongjian, as well as Inner Mongolia Autonomous Region. Their estimated 2000 population totalled 10.68 million. The Manchus are descended from peoples of northeastern Asia collectively called the “Tungus.” The Manchus also claim descent from rulers of the Jurchen Jin dynasty (1125–1234).

The Manchu tribes in the late sixteenth century were organized into a collective nation under the rule of their greatest chief, Nurhaci (1559–1626). Nurhaci’s successor, Abahai (1592–1643), changed the name of his people to Manchu in order to remove the historical memory that as Jurchens they had been under Chinese rule. The Manchus continued to increase in military power in the border region northeast of the Great Wall and eventually overthrew the Ming dynasty (1368–1644) to establish China’s last imperial era, the Qing, or Manchu, dynasty. The Manchus remained an important symbolic people in China during the twentieth century, as was shown by their being named in 1912 as one of the five races that constituted the new Republican China (1912–1949).

The Manchu language is a member of the Tungusic branch of the Altaic language family and has some structural similarities to Japanese, Mongolian, and Korean. During the Jurchen Jin dynasty Jurchen official documents were transcribed using a modified form of the Khitan script. In 1599, as part of his nation building, Nurhaci commissioned two scholars to modify the Mongolian

script in order to create a written form of the Manchu language. This form of written Manchu is called the “old Manchu script” because it was further modified in the 1620s by the addition of circles and dots, which removed some of the linguistic ambiguities that had resulted from the first attempt to modify the Mongolian script. This new script remained the standard form of written language throughout the Qing dynasty.

Few native speakers of Manchu remain in China, although volumes of the written script are preserved as official documents of the Qing dynasty in the national archive in Beijing and provincial archives in the northeast.

Manchuria, ancestral homeland of the Qing dynasty, for decades was the target of colonial aspirations by neighboring Japan and Russia. The Japanese invasion of Manchuria sparked war between China and Japan and China’s later involvement in World War II. China’s postwar Communist Party developed the region into an industrial heartland. Today three provinces make up Manchuria: Heilongjiang, Jilin, and Liaoning.

Manchuria is the ancestral homeland of the Qing dynasty (1644–1912). Chinese resistance to Qing rule was in part based on the fact that the Qing, as Manchus, were foreign invaders, although sinicized. Manchuria is also where World War II began for China.

Manchuria is the region of northeastern China comprising Heilongjiang, Jilin, and Liaoning (Fengtian) provinces. Chinese refer to Manchuria as “Dongbei” (Northeast) as part of a larger effort to distance the region’s history from the colonial overtures associated with the term Manchuria, which was partly the creation of Japanese and Russian imperialists who hoped that the term would imply the region’s separateness from the rest of China.

Manchuria, bordered to the southeast by Korea and to the north and northeast by Russia, originally was populated by a number of tribal groups, the largest of whom were Manchus, Mongols, and Tungus. The region is rich in natural resources, including timber and forest products, coal, iron, furs, and ginseng. During the twentieth century foreign occupiers and later Chinese administrators developed Manchuria’s transportation infrastructure and industrial base. Today the region is one of China’s most important industrial heartlands.

The presence of Han Chinese in Manchuria dates back to the Qin dynasty (221–206 BCE), when a prefecture was established on the Liaodong Peninsula at the southernmost point of Liaoning Province. During the reign of Wu Di (reigned 140–87 BCE), the fifth Han emperor, a more important Chinese presence was established in Manchuria when Wu Di encouraged the settlement of Chinese on the Liaodong Peninsula and in an area of what is today western Liaoning in order to strengthen the northern borders against the Xiongnu peoples. For much of China’s imperial past, however, the presence of Chinese in this region beyond the Great Wall was only minimal. The Manchu rulers of the Qing dynasty, after their conquest of China in the mid-seventeenth century, sought to preserve Manchuria as an undeveloped ancestral homeland. The early emperors, including Shunzhi (1638–1661), Kangxi (1654–1722), Yongzheng (1678–1735), and Qianlong (1711–1799), issued decrees, of dubious effectiveness, forbidding Chinese to settle in the region.

Fear of Russian Annexation

The Qing emperors, with the increasing Russian presence in the Far East during the late eighteenth and early nineteenth centuries, grew to fear Russian annexation of
The last of the old no-settlement decrees were repealed, and northern Chinese were encouraged to settle in Manchuria. During the mid-nineteenth century the arrival of French and British warships off the coast of southern Manchuria during the Opium Wars also reminded the Manchus that the region had strategic importance and that its population and fortifications should be developed. But these belated efforts by the Qing rulers were not effective, and by the 1890s they had largely lost Manchuria to foreign imperialists, first Russian and then Japanese.

In 1896, after the First Sino-Japanese War (1894–95), the Qing rulers, now more worried about Japan’s colonial ambitions than Russia’s, allowed czarist Russia to construct the Chinese Eastern Railway across Manchuria as a shortcut and as an alternative route to the Trans-Siberian Railway. Russia secured more concessions from a declining Manchu court in 1898, including a twenty-five-year lease on the southern portion of the Liaodong Peninsula and the right to build an additional southern route of the region’s railway that would bring the added advantage of having a year-round ice-free port as its terminus in the
new leasehold. After the Russo-Japanese War of 1904–05 the new Russian rights in southern Manchuria, together with the region’s railway and harbors at Dalian (“Dairen” in Japanese and “Dalny” in Russian) and Lushun (Port Arthur), were transferred to Japan.

### Japanese Colony

The Japanese governors of southern Manchuria continued to expand on Russia’s original plans, and their new colony boomed during the soybean boom of the late 1910s. But by the late 1920s tension was increasing as Japan’s colonial ambitions in Manchuria no longer could be satisfied by a small leasehold on the Liaodong Peninsula and with attempts by commanders in the local Japanese garrison force, the Guandong (Kwantung) Army, to control the region’s de facto ruler, warlord Zhang Zuolin (Chang Tsolín). The Guandong Army blew up a section of the Southern Manchurian Railway on 18 September 1931 and soon after launched an invasion of Manchuria, an event that triggered the War of Resistance against Japan (1937–1945) and China’s eventual involvement in World War II. In 1932 Japan proclaimed the birth of the “independent” nation of Manchukuo (Country of the Manchus). But in reality Manchukuo was a child of the Japanese military and a puppet state with no real independence. Manchuria remained under Japanese occupation until the end of the war in the Pacific in 1945, contributing raw materials to the home islands and playing an important role in the creation of Japan’s colonial ideology. Many Japanese viewed Manchuria not only as a strategic buffer zone between their empire and the Soviet Union but also as a colonial frontier, even a potential utopia, awaiting the arrival of intrepid Japanese settlers who would develop the region’s vast potential.

The Russians returned to Manchuria after Japan surrendered in 1945. Soviet troops, having resecured rights in the region at the Yalta Conference in February 1945 in return for a promise to enter the war against Japan, invaded Manchuria during the final days of the war in the Pacific. Russia plundered the region during the next couple of years, dismantling factories and sending them in pieces on railcars back to the Soviet Union. Because of Manchuria’s industrial capacity and abundant natural resources, during the Chinese Civil War (1945–1949) between the Communists and the Nationalists the region was a hotly contested territory.

Since the 1950s China has developed Manchuria as its industrial heartland. The Fushun colliery, the steel mills at Anshan, the giant factories in the industrial cities of Shenyang (Mukden) and Changchun, and the commercial port of Dalian played vital roles in the industrialization strategies of the Chinese Communist Party. Industrial Manchuria, with the campaign to create a market economy in China during the late 1980s and early 1990s, began to experience new challenges. Many of the inefficient state-owned enterprises either closed or severely reduced their workforces. This development led to a high level of unemployment in a region that had been prosperous under the state-planned economy. Decades of industrialization have also created environmental problems in Manchuria, including high rates of respiratory diseases among its people and high levels of toxins in waterways. The ancestral homeland of the Manchus is now polluted and home to tens of millions of Han Chinese factory workers.

In an attempt to bring China into a confrontation with Japan over control of Manchuria, Japanese troops used explosives to destroy a segment of the Manchurian railway. This bombing became known as the Manchurian Incident, and the events that followed positioned Japan for its attempt at Asian and Pacific conquest during World War II.

The Manchurian Incident (also called the “Mukden Incident,” the “September 18 Incident,” or the “Liu-tiaoguo [ditch worker] Incident”) occurred on 18 September 1931 when explosives destroyed a section of the South Manchurian railway near the city of Mukden (Shenyang) in Liaoning Province. Japanese troops stationed near the railroad were responsible for the bombing, which was intended to draw China into a confrontation with Japan over control of Manchuria. Although the Chinese government did not respond to the provocation by declaring war, Japan mobilized troops, occupied the region, and established the puppet state of Manchuguo.

Background

The Treaty of Shimonoseki ending the First Sino-Japanese war of 1894–1895 originally ceded Formosa (Taiwan), the Pescadores, and Liaodong Peninsula to Japan. France, Germany, and in particular Russia objected to Japanese control of Liaodong and pressured Japan to return the territory in exchange for an increased indemnity of 30 million taels (currency based on the weight of silver). Almost immediately Russia began construction of a new South Manchurian railway, linking Harbin (a major city on the East Manchurian railway) with Port Arthur (Lushan) on the tip of the Liaodong Peninsula. These two rail lines, bisecting Manchuria and protected by 175,000 czarist troops, effectively brought the region under Russian control. The Japanese considered Russian aggrandizement in Manchuria a direct threat not only to their national security via a possible attack through Korea but also to their own imperialist ambitions in East Asia. The inevitable confrontation between the two began on 8 February 1904 when the Japanese navy launched a surprise attack on the Russian fleet anchored at Port Arthur. Japan’s capture of Port Arthur in January 1905 and the destruction of the Baltic fleet at the Battle of Tsushima in May 1905 forced Russia to sue for peace. The Treaty of Portsmouth (5 September 1905) ending this conflict stipulated that Japan would assume Russian leases on the Liaodong Peninsula as well as control of the South Manchurian Railway. Both nations agreed to withdraw from Manchuria and to recognize China’s sovereignty over the region.

The collapse of the Qing dynasty (1644–1912) led to the rise of warlords in China. By the early 1920s one of the most powerful of these was Zhang Zuolin, who controlled all of Manchuria through his Fengtian Army, a well-equipped fighting force of 100,000 troops. At this time approximately ten thousand Japanese soldiers of the Guandong Army were also stationed in Manchuria.
to protect the railroad. Many young officers in this army were eager to spark a war with China in order to annex Manchuria as Japan had done to Korea in 1910. As Zhang was returning to Shenyang from Beijing on the morning of 4 June 1928, a bomb planted by one of these young officers exploded near his private train, killing him instantly. Chiang Kai-shek, the leader of the newly formed Nationalist government in Nanjing, cautioned against reprisals. Zhang’s son, Zhang Xueliang (known as the “Young Marshall”) took over his father’s position as warlord of Manchuria and agreed to follow Chiang’s directives. War was averted, although the situation remained tense and uncertain.

The Incident

In December 1928 Zhang Xueliang pledged his loyalty to the Nanjing government and much to Tokyo’s disappointment brought the three provinces of Manchuria back under China’s nominal control. He maintained a hard line in negotiations with the Japanese, refusing to approve any new concessions and seeking to recover those already granted. Meanwhile he continued to strengthen his armed forces, which increased to nearly 250,000 troops. Responding to critical economic issues at home, military and civilian officials in Tokyo were preparing to issue directives prohibiting deliberate provocation by Japanese
troops in Manchuria. As the window of opportunity began to close, young Japanese officers again took matters into their own hands. On 18 September 1931 they detonated explosives along the South Manchurian Railway on the outskirts of Mukden near the largest Chinese garrison in the region. Chinese soldiers investigating the explosion were fired upon by Japanese troops, who pursued them back to their barracks and attacked the garrison.

As news spread of the alleged Chinese attack, Tokyo cautioned restraint, but the military responded aggressively. The commander of Japanese forces in Korea dispatched troops across the border into southern Manchuria. The Guandong Army was quickly mobilized, fanning out to occupy Mukden and other major cities. Surprisingly the army met with only sporadic resistance. Under orders from Chiang Kai-shek, Zhang’s troops had been forbidden to engage the Japanese in battle. Moreover, within three months all of Zhang’s forces had been redeployed south of the Great Wall, leaving Manchuria completely in the hands of the Japanese.

Implications

The abandonment of Manchuria sparked massive protests in China. A virulent anti-Japanese boycott spread throughout China, raising fears in Shanghai’s foreign settlements of violent reprisals. In late January Japanese marines who had been landed in the city to protect its businesses and citizens clashed with Chinese troops. In retaliation the Japanese bombed Zhabei, a residential and industrial suburb of Shanghai, and invaded the city. After fierce fighting an armistice was signed in May 1932.

By that time two other major events related to the Manchurian Incident had transpired. In the first event, just days after the first shots were fired, the Japanese had already approached the last Qing emperor, Puyi, about the possibility of his restoration as head of a new Manchu state. In November he left Tianjin for Changchun and in March 1932 was installed as chief executive of the new state of Manchuguo. The second event was China’s appeal to the League of Nations demanding Japan’s withdrawal from Manchuria. In November the league sent a delegation to Manchuria headed by Lord Lytton of Great Britain to investigate the situation. Lytton’s report concluded that the Manchurian Incident was a Japanese fabrication and that Manchuguo was not a sovereign nation but rather a puppet state of the Japanese military. The League of Nations voted to uphold the findings of this report, and Japan responded by withdrawing from the organization.

Now firmly entrenched in Manchuria and isolated from the international community, Japan was poised to embark on its imperialist conquest of Asia and the Pacific during World War II.

Mandarin

Guānhuà 官话
Pǔtōnghuà 普通话
Guóyǔ 国语

Mandarin is a linguistic term with four distinct senses: to early European missionaries Mandarin was the lingua franca of dynastic China; to the modern layman Mandarin refers to the standard language of present-day China; to the dialectologist Mandarin is the largest branch of Northern Chinese; whereas to the historical linguist Mandarin is synonymous with Premodern Chinese.

The term Mandarin is generally believed to be a translation of Chinese guanhua—literally “official talk,” which originated as a common language between speakers of different Chinese dialects. Out of this sense, the term grew to mean also the historical period dominated by this common language and the dialects descended from it. Finally, in the twentieth century, the term came to be equated with Modern Standard Chinese, the official language of the Chinese-speaking world, where it is also known as putonghua 普通话 (commoner’s language) or guoyu 国语 (national language).

Thus linguists view Mandarin in four different ways: (1) as a Chinese lingua franca, (2) as a branch of the northern Chinese dialect family, (3) as Premodern Chinese, and (4) as Modern Standard Chinese, also known as putonghua in mainland China, guoyu in Taiwan, and huayu in Singapore.

Mandarin as a Chinese Lingua Franca

Mandarin is believed to have originated as a common language among speakers of different Chinese dialects, loosely based on some form of northern Chinese. European missionary records suggest this prestige speech variety to be the dialect of Nanjing (Coblin 2000), with the accent of Beijing exerting growing influence towards the end of the nineteenth century. The Jesuit missionary Matteo Ricci wrote in his travel journals (1583–1610) of a spoken language known as Quonhoa, which was used throughout the empire for civil and forensic purposes. He further explained that the Quonhoa dialect was typically used between visitors and natives of the provinces they visited, serving a function similar to that of the modern standard language today.

Mandarin as Modern Standard Chinese

The second sense of Mandarin focuses on the vicinity of Beijing—the Chinese capital for the past five hundred years—whose local speech presumably had a prestige that conflicted with the prestige status of the guanhua. Eventually, the shared language grew more like the everyday speech of Beijing. By the end of the nineteenth century, the two languages were similar. The remnant of the old guanhua became known as the literary stratum of Beijing
Mandarin, and the local vernacular as the colloquial stratum. There are minute pronunciation differences between the literary and colloquial strata. For example, the word to learn, which is pronounced xue in the literary stratum, is rendered xiao in colloquial Beijing. Similarly, the word for night watch, for example, is pronounced geng in literary Beijing, but jing in colloquial Beijing. Differences exist also in vocabulary, with guanhua leaning towards classical Chinese and colloquial Beijing being more abundant in localisms.

From the end of the Qing dynasty (1644–1912) to the early days of the Republican era (1912–1949), the recognition of Beijing Mandarin as a national standard took a more complex route. The uncertainty surrounding the status of Beijing Mandarin at the time is highlighted by a meeting of linguists who gathered in 1913 to decide upon the new official language. The linguists settled on a standard that was not the speech of the capital but an artificial language incorporating elements from major dialects. This decision was seen as a compromise between north and south. But it soon became clear that no one, not even the linguists themselves, could speak this artificial language, and the movement failed miserably.

In 1920 Professor Zhang Shiyi called for replacing the artificial standard with the speech of Beijing locals educated to the level of secondary school. Zhang’s proposal initially met with resistance from the original committee, but as the pieced-together national language crumbled, Beijing Mandarin took over as the national standard. In 1926, when the national language was revised, pronunciations were largely based on the literary readings of Beijing. The new national language, up to this point, had been known as guoyu (national language), to borrow a Japanese usage, and still goes by this name in Taiwan.

On the mainland, however, the national language underwent a second revision in 1955 and switched to the name putonghua (commoners’ language), what is normally translated now as Modern Standard Chinese. Differences between putonghua and guoyu are few, mainly in the adoption of colloquial pronunciations in the case of putonghua, whereas guoyu retains the 1926 literary norms. The 1955 revision successfully defined the nature of the

Modern Standard Chinese, as the official language of the Chinese-speaking world, came to be equated with the term Mandarin in lay usage. national language, which, according to the 1955 National Language Reform Committee, “bases its pronunciation on the speech of Beijing, its lexicon on the core vocabulary of Northern Chinese, and its syntax on the norms of exemplary vernacular literature” (Li 1999, 32). In many ways this was not a revision but a restatement of natural rules that have governed the language since its inception in 1926.

Tone aside, Modern Standard Chinese contains between 398 and 419 syllables, depending on whether we are to include certain Beijing colloquialisms as part of the educated vocabulary. The syllable is traditionally analyzed into an initial consonant and a final, as shown in the tree diagram for the word niao, bird. (See table 1.)

“Final” in Chinese phonology refers to the syllable less the initial consonant (if any); in other words, the “final” is the medial plus the rime portion of the syllable. (See tables 2 and 3.) The possible initials and finals of Modern Standard Chinese are given in both pinyin romanization (in italics) and the International Phonetic Alphabet (in brackets).

Full syllables in Modern Standard Chinese carry one of four tones, which play a role in distinguishing word meaning. (See table 4.)

Tone 3 often rises when it occurs at the end of a sentence or utterance and is sometimes referred to as the dipping tone. In addition to full tones, grammatical particles, suffixes, and unstressed syllables in Mandarin Chinese are often stripped of their tonal value, a condition referred to as being in the neutral tone.

Mandarin, like most other varieties of Chinese, is relatively free of inflection. Nouns generally are not marked for case, number, or gender. Verbs need not agree with the person, number, or gender of the subject or object. As such, much essential information is encoded in the syntax (word order) of a sentence.

There is much controversy over word order in Mandarin. While the simple declarative sentence in Mandarin retains the subject-verb-object (SVO) order of Old Chinese (600 BCE–265 CE), Modern Standard Chinese contains characteristics of languages with the basic word order subject-object-verb (SOV). In the early 1980s, some linguists saw this as evidence that Mandarin Chinese was in the process of transitioning from SVO to SOV, most likely due to influence from the Altaic languages of northern China. But recent scholarship in language acquisition and actual samples of spoken

Chinese have revealed that SOV structures in Mandarin are infrequent, marked forms that are not easily acquired by young children, and that such properties are not unusual in rigid SVO languages such as English and biblical Hebrew. The prevailing view, for now at least, seems to be that Mandarin Chinese, like most other languages of southern and southeastern China, is a typical SVO language.

Mandarin as a Branch of Northern Chinese

Mandarin, or guanhua, refers to a branch of Northern Chinese, which includes dialects used throughout most of northern and southwestern China, the majority of which are descended from or have had extensive contact with the guanhua lingua franca. Mandarin, in this context, refers to an entire dialect family, the largest family in the sinitic branch of Sino–Tibetan, in terms of both geographical distribution and number of speakers.

The Mandarin family is distinguished from other dialects of Chinese by way of five shared innovations: velar palatalization; spirantalization of initial /m/; merger of final /m/ with /n/; loss of initial /ŋ/; and the development of voiced obstruents into voiceless aspirated and unaspirated initials depending on tone.

Within the Mandarin family are three main divisions comprising eight subdialects (after Liu 1995): Southern Mandarin includes the Yangzi (Jianghuai guanhua) and Southwestern (Xinan guanhua) subdialects; Central Mandarin includes the Central Plains (Zhongyuan guanhua) and Northwestern (Lanyin guanhua) varieties; and Northern Mandarin includes Northeastern (Dongbei guanhua), North Central (Jilu guanhua), Peninsular (Jiaoliao guanhua), and Beijing Mandarin (Beijing guanhua).

Mandarin as Premodern Chinese

From the Tang dynasty (618–907) onward, the homeland of the shared northern Chinese language was successively occupied by peoples of Turkic, Mongol, and Tungus–Manchu stock, resulting in the drastic simplification of Middle Chinese (265–1269). The product of this simplification is described by Chinese linguistics also as guanhua, or Mandarin. Thus Mandarin is synonymous with what linguistics call Premodern Chinese and refers to the language of northern China from the Yuan dynasty (1279–1368) to the present day.

Linguists further divide the Mandarin period into three parts. Early Mandarin (1269–1455) is typified by the opera manual Zhongyuan Yinyun (Rhymes of the Central Plains, 1324) by Zhou Deqing (1277–1365). Middle Mandarin (1455–1795) is preserved in Chinese–Korean language primers such as Hongmu Jeongun Yeokhun (Standard Rhymes of the Reign of Hongwu, Annotated and Transcribed, 1455) and Saseong Tonghae (Thorough Investigation of the Four Tones, 1517), as well as the Yunlue Huitong (Summary Compendium of Rhymes, 1642) and other Chinese rhyme...
manuals. Mandarin from the mid-nineteenth century to the present is considered to have changed very little and is referred to as Modern Mandarin or Modern Chinese.

MAO Zedong
Máo Zédōng 毛泽东
1893–1976  Founder of the Chinese Communist Party

Mao Zedong was a founding member of the Chinese Communist Party and the architect of China’s Communist revolution. Some of his socialist policies failed, but his legacy as a firm nationalist leader and the “founding father” of an independent China still inspires post-Mao generations.

Mao Zedong, raised in central Hunan Province by a middle-class peasant family, was the leading architect of China’s twentieth-century Communist revolution. After receiving both a traditional education and a Westernized normal school training and being inspired by the antiforeign revolutionary nationalism of the May Fourth Movement, Mao in 1921 became a founding member of the Chinese Communist Party (CCP).

While cooperating with the Chinese Nationalist Party (Guomindang, GMD) Mao worked on rural issues, serving as principal of the Sixth Session of the Peasant Movement Training Institute in 1926. He wrote one of his most important early works, “Report of an Investigation into the Peasant Movement in Hunan,” just as the Communist alliance with the Nationalists unraveled in 1927. As the Communist Party collapsed in the urban areas, Mao retreated to the countryside. His view that the peasants, as the most oppressed social class, were the most revolutionary clashed with the more
traditional Communist view of other party leaders, who concentrated on China’s rather small industrial-worker class. Mao from 1927 to late 1934 championed the peasant struggle, building with Zhu De (1886–1976) and others the Red Army that used guerrilla tactics against GMD forces. Between late 1927 and late 1934 Mao headed a Communist base area in the Jiangxi region that for a brief time functioned as a Soviet republic but soon became the target of encirclement campaigns launched by Nationalist leader Chiang Kai-shek. Mao and others, forced to flee their bases in southeastern China, led the army to northwestern China on what became known as the “Long March.” Mao became the chairman of the CCP in 1935—a position he retained until his
death—and his views on the importance of the peasants to China’s revolution became dominant.

The takeover of Manchuria by Japan in 1932 and China’s War of Resistance against Japan (1937–1945, known outside China as the Second Sino-Japanese War) caused Mao to shift his attention from internal struggle to the external imperialist threat. While the Communist Party fought anti-Japanese rear-guard actions from 1936 to 1945, Mao formed his views of a socialist revolution in China. He differed from traditional Marxist doctrine in the emphasis he put on peasants, but he retained the concepts of class struggle and the vanguard role of the party. In 1945 his concepts were enshrined in the CCP’s Seventh Congress constitution as “Mao Zedong Thought.”

During the war years nationalist spirit spread support for the CCP. In 1945 halfhearted attempts at a coalition government presaged civil war against the GMD. The Communist Party renamed its military the “People’s Liberation Army” (PLA) and used Mao’s strategy in North China of surrounding cities from the countryside to gain advantages over the GMD. This strategy led to the Communist victory by Mao, who in October 1949 oversaw the founding the People’s Republic of China. However, by the summer of 1950 China was drawn into Cold War struggles in Korea (Mao’s son was killed in U.S. bombing there) and fought U.N. forces to a draw, setting the stage for anti-Americanism triggered by continued U.S. support for the Nationalist government in Taiwan.

“Land to the Tiller”

On the domestic front Mao turned attention to China’s socialist transformation. The first priority was land reform. Vowing to keep the promise of “land to the tiller” made by Nationalist revolutionary Sun Yat-sen (1866–1925), Mao pushed policies that by 1955–56 created the basic collectivization of newly distributed land into agricultural producers’ cooperatives. China, following the Soviet Union’s definition of socialism, also established basic state ownership of industry by the time the Eighth CCP Congress convened in 1957. While other party leaders, especially Deng Xiaoping (1904–1997) and Liu Shaoqi (1898–1969), were ready to consolidate early achievements, Mao, who was worried by the problems of corruption and bureaucracy, first invited and then quashed criticism by intellectuals in the Hundred Flowers initiative and the ensuing anti-Rightist campaigns against those who were deemed reactionary. Mao argued that consolidation could result in a loss of momentum, even reversal, by entrenching a new generation of elites. His campaign to achieve the natural socialist potential of the newly released peasant masses led to his policies of the Great Leap Forward (1958–59), which was aimed at creating a “new socialist man.” Rightist intellectuals and other party critics were to be reformed by physical labor, especially by working at the poorly conceived backyard steel furnaces, which, Mao promised, would allow China to overtake England in steel and iron production. This campaign also was meant to transfer technology to the countryside using the new People’s Communes as the economic, social, and political interface with the center. But famine and failures resulting from the Great Leap Forward created the first serious fissure within the CCP leadership and disillusion with Mao among the general Chinese population just as
he began to form his own cult of personality as the senior leader and, as he envisioned it, heir to Soviet leader Joseph Stalin within the international socialist camp.

Relations with the Soviet Union suffered, however, from Mao's failed policies. Criticism of his deviations from Soviet models led to Soviet withdrawal of technical experts. This withdrawal disrupted major infrastructure projects. Mao struck back by criticizing the Soviet Union for following the “capitalist road.” He defended his policies as the logical next step in the world socialist movement, a posture that worsened the Soviet-Sino split. In China, even as the country recovered from the disasters of the Great Leap Forward, Mao denounced many within the party for “taking the capitalist road” like the Soviets,

This statue of Mao Zedong with upraised hand evokes the pronouncement he made on 1 October 1949, the day the People’s Republic of China was born: “China has stood up.”
and for failing to continue the revolution. In response he launched the Cultural Revolution (1966–1976). Helped by General Lin Biao (1907–1971), who promoted the study of Mao’s ideas among the ranks of the PLA in the ubiquitous, Western-dubbed Little Red Book, Mao began his attack first against noncompliant party intellectuals and then against the central core of the party leadership, again accusing them of being “capitalist roaders.” By mobilizing the masses, especially Red Guard youth, closing schools, and using his own cult image, Mao intended to create a generation of revolutionary successors deserving of the sacrifices of parents’ and grandparents’ generation. But over-exuberant attacks on authority threatened chaos. Many party members were sent to May Seventh Cadre Schools (established after Mao’s 7 May 1966 directive, these rural schools demanded that students perform hard labor when not studying Mao’s philosophies. By the summer of 1968 Mao was sending hordes of students to the countryside to “learn from the peasants.” Mao institutionalized the Cultural Revolution at the Ninth Party Congress in April 1969 by forming Revolutionary Committees in government offices, factories, and communes. Mao also rewarded Lin Biao for his work in building the Mao cult by naming him as his successor.

Mao’s growing suspicion that he had been betrayed by Lin Biao, China’s admission to the United Nations, and continued Sino-Soviet border disputes prompted Mao in 1972 to invite U.S. president Richard Nixon to China, despite U.S. military involvement in Vietnam. From 1972 until Mao’s death in 1976, ideologues, including Mao’s wife, Jiang Qing (1914–1991), attempted to assert power under cover of Mao’s name.

Mao’s death concluded an era of radical ideological leadership in China, but his legacy as a firm nationalist leader and the “founding father” of an independent China still inspires post-Mao generations. Mao’s preserved body continues to lie in state in his mausoleum in Tiananmen Square, whereas the bodies of Stalin and Russian Communist leader Vladimir Lenin have been buried. While their statues have been removed from public places, Mao’s remain on display, and Mao souvenirs are still popular items among both Chinese and foreign tourists.

“People’s War”

In addition to their influence in China, Mao’s concepts of a “people’s war” using guerrilla tactics were adopted by Vietnamese leader Ho Chi Minh even during Mao’s lifetime. His ideas on this subject are also used in Western military training to teach counterinsurgency. In other parts of the world Maoist groups exist, such as the Sendero Luminoso (Shining Path) in Peru, the Naxalite movement in India, and in 2008 the Maoists in Nepal who won a civil war under the leadership of the self-proclaimed Maoist leader Comrade Prachanda. These groups have emphasized Mao’s strategy of a peasant-led anti-imperialist, anti-bourgeoisie struggle to seizing power rather than his economic development model.

Further Reading

The collected works of Mao Zedong, leader of the Chinese Communist Party from the 1930s to his death in 1976, are composed of his writings on political, military, economic, and philosophical affairs. Originally presented as the basis of Mao Zedong Thought, after his death this concept was revised to include the ideas of other CCP revolutionaries prior to 1949.

The collected works of Chinese Communist Party (CCP) leader Mao Zedong and Mao Zedong Thought, now defined as a scientific ideological system developed by early CCP revolutionaries applying Marxism-Leninism in a Chinese context, were an inspiration to revolutionaries around the world in the 1960s and 1970s as well as a linchpin of China’s Cultural Revolution (1966–1976). Since Mao Zedong Thought began to be recognized as a unique and critical component of party ideology in the early 1940s, many collections of his works have been published in China. During the Revolutionary War period prior to 1949, several collections were published in China but, because of limited resources and wartime conditions, not in substantial numbers. The best-known collection is the four-volume Selected Works of Mao Zedong, published between 1952 (Volume 1) and 1960 (Volume 4) (and in English in the 1960s).

The Selected Works consists of carefully chosen and significantly edited pieces written by Mao between 1926—during the First United Front, a period from 1923 to 1927 during which the CCP united with the Nationalist Party (Guomindang) in an attempt to unite China—and September 1949, less than a month before the founding of the People’s Republic of China on 1 October. The pieces contain a wide range of political and political-economic analyses, beginning with “Analysis of the Classes in Chinese Society” (March 1926) and including analyses of domestic and international situations, military writings discussing strategies and tactics from the revolutionary period, and some of his best-known philosophical writings, such as “On Practice” (July 1937) and “On Contradiction” (August 1937). They also include what later became known as the “Three Constantly Read Articles”: “In Memory of Norman Bethune” (December 1930), “Serve the People” (September 1944), and “The Foolish Old Man Who Removed the Mountain” (June 1945), which celebrated the revolutionary spirit of working for the public good and overcoming obstacles regardless of costs.

In the early 1960s additional collections, most famously the Selected Readings from the Works of Mao Zedong, Selected Military Writings of Mao Zedong, and numerous versions of Quotations from Chairman Mao (known in the West as the “Little Red Book”), were published, many under the sponsorship of Mao’s then-designated successor, Defense Minister Lin Biao (who later died allegedly fleeing after an attempted coup against Mao). But the Little Red Book isolated brief quotes from Mao’s work to be memorized and applied universally, thus virtually eliminating any real meaning. While providing an underlying basis for unity, the book allowed the quotes to be reduced
to slogans used in internecine (relating to conflict within a group) struggles. Two lesser-known but more substantial collections entitled *Long Live the Thought of Mao Zedong!* were published by unnamed sources during the Cultural Revolution. They contain Mao’s previously unpublished but significant works and speeches.

After Mao’s death the fifth volume of the *Selected Works*, including selected works through 1957, was published in 1977 in part as an unsuccessful effort by Mao’s successor, Hua Guofeng, to strengthen his own position. Finally, between 1993 and 1999 an additional eight-volume *Mao Zedong Works* was published, including over eight hundred works not included in the *Selected Works* but specifically excluding works associated with the Cultural Revolution, which the Chinese Communist Party in 1981 had labeled a mistake initiated by Mao.

Evaluation of China’s revolutionary founder, Chairman Mao, began in 1981 when Deng Xiaoping presided over an official resolution declaring Mao Zedong “chiefly responsible” for the disastrous Cultural Revolution. The resolution set in stone a political formula defining Mao as 70 percent good and 30 percent bad. Outside of China, however, more comprehensive literature presents Mao in a less positive light.

On 27 June 1981 China’s Communist Party formally adopted a posthumous evaluation of Chairman Mao Zedong that included some stark admissions about Mao’s responsibility for the Cultural Revolution (1966–1976), a ten-year-long social upheaval, and other grave errors. This official evaluation performed a delicate balancing act. It dimmed the luster of Mao by exposing his fallibility, and yet it preserved him on a pedestal as China’s most important revolutionary leader. Later the party’s official evaluation of Mao as mostly positive would come to be identified with the ratio 70 percent good, 30 percent bad.

Albeit a crude oversimplification, this 70:30 ratio reflected the bottom line of a hard-won consensus: China’s revolutionary founder was not to be debased, only demystified. The evaluation defined Mao’s “ultra-left excesses” as “errors” rather than “crimes.” His contribution to China’s revolutionary history, especially prior to 1956, was still assessed as glorious and indispensable. To underline the finality of this official evaluation, Communist Party leader Deng Xiaoping informed a foreign journalist that Mao’s portrait would continue to occupy its customary place of honor in Tiananmen Square.

In issuing this partial rebuke of the deceased chairman, the post-Mao leadership indicated that it would not go so far as the Soviet Union had in renouncing its paramount leader. In 1956 Soviet leader Nikita Khrushchev’s so-called Secret Speech criticized Russian leader Joseph Stalin unspARINGLY as a crude and callous dictator. Only Russian Communist leader Vladimir Lenin was left standing as the untarnished pillar of party legitimacy. To dramatize Stalin’s ejection from the revolutionary canon, the Soviet leadership removed Stalin’s corpse from its initial resting place in the Lenin Mausoleum in 1961. In China, however, Mao was both the accomplisher of the revolution and the guiding force of state socialism post-1949. Mao loomed so large in China’s Communist Revolution that he was the equivalent of Lenin and Stalin combined. To displace Mao from the mausoleum or to remove his portrait from Tiananmen Square would mean leaving Communist China without a founding father. Even characterizing Mao as equally good and bad (50:50) might fatally wound the legitimacy of China’s Communist Party. Thus the party’s official evaluation was a stop-gap measure to forestall a more complete, open-ended assessment endangering the party’s hold on power. Mao’s towering personality pervaded party history like a colossal Buddha carved into a mountain. To destroy the icon threatened the integrity of the revolution itself.

The “Resolution on Certain Questions in the History of Mao Zedong, Evaluation of Píngjià Máo Zédōng 评价毛泽东
of Our Party since the Founding of the People’s Republic of China” was adopted at the convening of the Sixth Plenum in June 1981 on the eve of the sixtieth anniversary of the Communist Party’s founding. This watershed document ratified by the eleventh Central Committee announced the party’s intention to shed the unwanted skin of radical Maoism. Henceforth China would become a postrevolutionary society under the pragmatic leadership of Deng Xiaoping. The government would avoid disorder at all costs. The painful experience of the Cultural Revolution had thoroughly discredited Mao’s advocacy of class struggle and revolutionary upheaval. The resolution sought to bury extremist thinking associated with Mao and to establish the theoretical foundation for China’s so-called Second Revolution. The resolution’s unanimous ratification consolidated Deng’s rise to power as a paramount leader just as an earlier resolution on party history in 1945 had signaled Mao Zedong’s triumph as a guiding theorist. Deng’s status as commander-in-chief was further consolidated by his election to the powerful position of chairman of the Military Commission of the Central Committee during the same session in which the 1981 resolution was adopted. Deng’s protégé, Hu Yaobang, was voted into the post of chairman of the Central Committee.

Deng Xiaoping used the resolution as a tool not only to deflate the residual influence of Mao’s policies but also to dislodge Mao’s chosen successor, Hua Guofeng, from his post as chairman. Hua Guofeng resigned as chairman just as an earlier resolution on party history in 1945 had signaled Mao Zedong’s triumph as a guiding theorist. Deng’s status as commander-in-chief was further consolidated by his election to the powerful position of chairman of the Military Commission of the Central Committee during the same session in which the 1981 resolution was adopted. Deng’s protégé, Hu Yaobang, was voted into the post of chairman of the Central Committee.

Eroding Credibility

Even before his complicity in purging Deng was publicized, Hua Guofeng’s credibility as Mao’s successor had been rapidly eroding. Hua found himself consistently upstaged by his skilled rival, who was both well respected by the military and a veteran party administrator. By 1981 Deng’s rise to paramount status was a foregone conclusion. The resolution’s portrayal of Mao as decrepit in his final years helped to explain why it was necessary for Hua to exit his leadership post. Hua had positioned himself as Mao’s double, even modeling his physical appearance so that he closely resembled Mao.

The resolution positioned Deng Xiaoping and his allies favorably as sponsors of political reform. It conceded the party’s own errors in succumbing to ultraleftism and promised to adopt a middle course in the future and to return to regularized procedures and collective decision making within the party. The resolution also broke with Hua Guofeng’s previous strategy of blaming the rash excesses of the Cultural Revolution entirely on Mao’s henchmen, the so-called Gang of Four. The resolution made the bold assertion that Mao was “chiefly responsible” for instigating the “catastrophe.” Furthermore, the resolution placed the Cultural Revolution in quotation marks whenever it appeared in the text. This deliberate editorial strategy conveyed a subtle message controversial at the time. It suggested that Mao’s vaunted movement to revolutionize culture, the Cultural Revolution, was not merely a good thing spun out of control but a bad idea from start to finish.

As a twice-purged victim of the Cultural Revolution himself, Deng Xiaoping was able to persuasively differentiate himself from those who had spearheaded Cultural Revolution policies. He could use his affinity with those who had suffered as a political asset in his struggle to retire the remaining Maoists on the one hand and to quell rising social discontent on the other. The resolution proved popular with the Chinese public at a time when inhibitions were dissolving and anger at the party was mounting. The trial of the Gang of Four in 1980 had publicized atrocities committed during the Cultural Revolution and opened the floodgates to political criticism. A Democracy
Wall movement was gaining momentum in the nation’s capital. Deng Xiaoping made use of conspicuous public restlessness to press for bold reforms to regularize and institutionalize decision making within the party. Deng instigated new safeguards to prevent the egregious concentration of power at the top that Mao Zedong had proven able to accrue. However, Deng was determined to keep the groundswell of public opinion from threatening the party’s overall hold on power. The democracy movement was politically useful for him in his struggle against ideological conservatives, but he feared that spontaneous protest might snowball beyond the government’s control, as it had in Poland and other countries within the socialist bloc. The resolution was part of an official effort to define for the awakening public how much scrutiny of the past and criticism of the present would be tolerated.

Deng Xiaoping’s protégé, Hu Yaobang, chaired the committee charged with drafting the resolution, and Deng Xiaoping himself intervened repeatedly over the fifteen-month drafting of the document to shape its language and tone. The end product was kinder to Mao than originally conceived, softened as the drafting committee encountered opposition from entrenched Maoists in the party and military. Deng himself had served Mao as a loyal lieutenant for most of his career and would be inclined to take a mostly positive view out of deference for his predecessor’s indispensable role in spearheading the 1949 revolution. Deng also was aware of the destabilization caused by Khrushchev’s sweeping denunciation of Stalin in 1956.

**Diplomatic Protest**

Mao had reacted in anger to Khrushchev’s surprise assault on his predecessor’s memory because the pointed
A 1976 newspaper headline about the death of Mao, who lived to be eighty-two.
critique of Stalin as one who fostered a cult perverting party principles could be leveled at Mao himself. Mao considered Khrushchev’s treatment of his predecessor’s memory unbalanced, and he lodged a diplomatic protest suggesting that a 70 percent positive evaluation was more appropriate. With regard to his own record, Mao had requested that Deng as acting premier institute a similar retrospective evaluation of the Cultural Revolution (70 percent good, 30 percent bad), but Deng had demurred. These precedents may have swayed Deng’s decision to take a similar 70:30 approach to Mao’s own evaluation. Deng also recognized that even a deceased and diminished Mao continued to possess considerable charismatic appeal. For the Chinese people Mao’s personality was inseparable from the soul of the new nation. Deng could not extinguish residual love for Mao even if he had aspired to, so he might as well make use of it. But Mao’s popularity represented a double-edged sword for Deng and his allies because parts of Mao’s theoretical legacy were clearly at odds with the reformers’ plans for economic modernization. Indeed, Deng was pressing forward with the very market-based reforms, the notorious capitalist road, that Mao had famously denounced as “revisionist” during the Cultural Revolution.

Deng’s solution to this quandary was to downplay the significance of ideology altogether. He scaled back the pervasiveness of revolutionary politics in Chinese life in general so that economic modernization and education could come to the fore. To justify this move ideologically, Deng elevated Mao’s early slogans “Seek Truth from Facts” and “Practice Is the Sole Criterion of Truth” to positions of prominence. The resolution celebrated Mao’s most pragmatic sayings and used the authority of Mao’s own words to make a critique of radical Maoism. Thus the aging Mao was said to have departed from the transcendent, uncorrupted body of thought called Mao Zedong Thought. This set of guiding principles was not merely the product of one man but rather “the crystallization of the collective wisdom of the Chinese Communist Party” (Resolution 1981, 29). The content of Mao Zedong Thought was defined vaguely as the “summary of the experiences that have been confirmed in the practice of the Chinese revolution” (Resolution 1981, 29). Thus Mao Zedong Thought was reconfigured to become something abiding but fluid, a spiritual resource for energizing society in whatever direction the current leadership felt was necessary. Deng and his allies attempted to transfer the charisma associated with Mao onto a streamlined set of Mao’s principles. Indeed, what the post-Mao leadership called Mao Zedong Thought was so narrowly construed that it should be distinguished from the more complete repertoire of what Mao said and did during his lifetime, a subject typically called “Maoism” or “Mao Studies” outside of China. The resolution’s redefinition of Mao Zedong Thought so negated Maoism’s radical core that some might say that the Deng regime performed a lobotomy on Mao’s ideological legacy. The critic of bureaucracy who called on the masses to rise up against the party during the Cultural Revolution had become something close to his opposite. Now Mao was a benign ancestor who presided over social order and safeguarded the Communist bureaucracy.

After decades of international isolation and political turmoil under Mao’s rule, the Chinese people in 1981 were understandably exhausted by revolutionary upheaval and yearned for a stable and prosperous society. Deng Xiaoping’s pragmatic outlook on politics and his restoration of education and economic development as priorities for society promised a better future for China. The relatively candid nature of the resolution was applauded by many inside and outside of China as a welcome step toward more effective governance and greater public accountability. Indeed, the resolution was a more serious and forthright critical evaluation of party history than the Soviet Union had undertaken prior to the era of Soviet leader Mikhail Gorbachev. Nevertheless, it must be recognized that the resolution of 1981 was governed by the political necessities of Deng Xiaoping’s consolidation of power and should not be accepted as the final word on Mao’s legacy. While it confronted the Cultural Revolution tragedy fairly candidly, it did not remove all the troubling skeletons from the closet. For example, it tiptoed past two catastrophic failings with which Mao was closely associated—the Anti-Rightist Campaign, a devastating purge that sent an estimated 700,000 intellectuals to perform hard labor in the countryside, and the Great Leap Forward, Mao’s ill-conceived campaign to overwhelmingly increase economic productivity by reorganizing Chinese agriculture. It gently described the arbitrary and ruinous Anti-Rightist Campaign as “entirely correct” but “too broad in scope.”
“Serious Difficulties”

With regard to Mao’s Great Leap Forward policies, retrospectively calculated to have caused 30 million deaths, the resolution merely refers obliquely to “serious difficulties” with the economy during the period from 1959 to 1961 and attributes much of the blame to “natural calamities and perfidious scrapping of contracts by the Soviet government” (Resolution 1981, 19). As suggested by these examples, the resolution’s evaluation of Mao contains many omissions and insufficiencies.

A more penetrating and complete evaluation of Mao and his legacy can be found in the large body of uncensored archival materials and critical literature devoted to Mao Studies outside of China. Recent scholarship based on party records and memoirs by those who had extensive contact with Mao, such as his private physician, Dr. Li, have knocked Mao further off his pedestal. Evaluations of Mao outside China are typically less favorable than the 70 percent good, 30 percent bad benchmark established by the 1981 resolution. Mao is now reckoned by some analysts to have brought about the deaths of more of his own people than any other leader in history. Stalin’s gulag claimed 15 million lives; Hitler’s extermination camps destroyed roughly half that number. But Mao’s repeated persecution campaigns to weed out bad social elements exceeded both in number, estimated to have caused as many as 70 million deaths. Khrushchev said of Mao that the Chinese leader treated people like “pieces of furniture.” Mao’s defenders would say that he was married to an ideal vision and that he steeled himself to defend revolution regardless of the human cost. Although his policies are controversial, Mao’s intellectual contributions continue to be admired, particularly among leftist thinkers. His main innovations to Marxist-Leninist theory and practice include his insistence on “study and investigation,” the need for frequent consultations between the leaders and the masses, and his flexibility in adapting theory to China’s specific local conditions, including his insight that farmers could be the agents of the Communist Revolution in China.

One Great Man

Most Chinese raised in the People’s Republic of China still reflexively view Mao as a hero and would not think it appropriate to compare their nation’s founder with so brutal a dictator as Stalin. (Ironically, Mao himself evaluated Stalin favorably as a firm and decisive leader.) The typical Chinese holds stubbornly to the memory of what Mao was in his heyday, a charismatic and unifying leader, rather than the detached and reckless instigator of destruction he became near the end of his life. Over time historical investigation may reveal that many of the contributions for which he is commonly credited were the work of others. Certainly Mao did not accomplish the rise of China completely on his own, as is sometimes implied. His ideas would have gone nowhere without the highly skilled implementation of administrators such as Zhou Enlai, Liu Shaoqi, and Deng Xiaoping or the strong work ethic and resilience of the Chinese people. Yet, Mao’s familiar countenance remains ubiquitous in China’s capital city today, conspicuously heralded as the One Great Man of New China on money, T-shirts, and key chains. Critical discussion of Mao remains politically sensitive and subject to censorship.

Momentous and Tragic

Like the first emperor, Qin Shi Huang Di, whose vast tomb was discovered in 1974 and whose iron-fisted, autocratic approach Mao came to admire, Mao’s impact on China was both momentous and tragic. Like Czar Peter the Great of Russia, Mao sought to drive a backward nation forward in the space of a single generation. He achieved rapid industrialization of China in several decades and fought two wars to defend neighboring countries from the military action of the United States (the Korean War and indirectly, the Vietnam War). While his actions resulted in some benefits to the Chinese state, what progress he made was clearly at the expense of China’s natural environment. His policies imposed a massive burden on the people of his generation. Mao’s ideological goals were just as ambitious as his modernization efforts. He sought to instill revolutionary consciousness in every person through systematic and repeated ideological education. Unlike Lenin, who emphasized the importance of party organization and the authority of an elite corps of professional revolutionaries to steer the masses, Mao charged entire social groups (whether peasants or student youth) to stage revolution for themselves and to derive
energy and insight from the revolutionary experience itself. Mao pursued a foreign policy independent of the Soviet Union after 1960 and aspired to make China the exemplary model of state socialism within the international socialist bloc during the Cultural Revolution. His idea to make revolution participatory inspired fanatical devotion and gave him a godlike status to rule as he wished. Thus the personality and policies of Mao Zedong left a deep imprint on the political culture of modern China, one that is both difficult to appraise and impossible to erase.

Further Reading

Marriage in China is essentially universal; divorce is rare. The traditional family system is based on male kinship. Since the 1970s China’s family-planning policy has required couples who want a child to apply for permission.

For twenty-five hundred years, through relatively secure and stable times and through stormy and catastrophic times, China’s family system has provided continuity in the social structure. Clans based on male kinship, in keeping with the precepts of the philosopher Confucius (551–479 BCE), coordinated village life under the autocratic rule of dynasties and subordinate elites. Even today, after a century of drastic changes and social development, China’s family system remains remarkably similar to that of its historical pattern.

Historically the patriarchal system was perpetuated by marriages arranged between the family of the groom and a family, usually from another village, whose daughter was a suitable bride. So nearly universal was marriage that the vast majority of Chinese found their social place in this family structure. As the twenty-first century begins, the preceding century of modernization and liberation of women has not deeply shaken China’s patrilocal...
marriage (brides living with the groom’s family) and family system in the rural areas.

Ideal and Reality

Traditionally the ideal Confucian family was an extended family that consisted of three or four generations who lived under the same or nearby roofs. The highest-ranking male was supposed to make family decisions, perhaps in consultation with other male kin. All others in the rigid family hierarchy under him were to obey these decisions. Theoretically the result was family harmony. Land, tools, houses, animals, furniture, and other belongings were to be held by the extended family unit. When the patriarch of the family unit died or was unable to govern, his sons became the heads of their extended families, with family land and other possessions being distributed among them. The practice of ancestor worship supported this system as reverence for ancestors was extended to reverence for the living older generation, especially the patriarch. Sons were needed to preside at some of the ceremonies; daughters were not qualified.

Almost every male outranked almost every female, except that young boys had to obey grown women in the family. Females were considered to be perpetual outsiders because the marriage system brought a bride from an outside family and village into her husband’s family and village. Even daughters who were born into the extended family were regarded as low-status, temporary sojourners because they were destined to marry out.

Indeed, the reality bore some resemblance to this ideal because females and subordinate males were economically dependent on the patriarchal family and risked social isolation and even destitution or starvation if they rebelled against the system of patriarchal control. But people were not necessarily as compliant and submissive as portrayed in this harmonious ideal. Their different personalities, preferences, and perspectives naturally clashed with some of the expectations of the system. Poverty also mandated adjustments that were at odds with the prescribed scenario. Besides, most of the time demographic realities prevented achievement of the extended family ideal. Illness was common, and the death rate was high. Data from 1929 to 1931 indicate that females and males in rural farm families had life expectancies of only twenty-four and twenty-five years, respectively. The low life expectancy was caused in part by high infant and young child mortality rates (three-fifths of children died before age five). But even those children who survived to age five could expect to live only to age thirty-eight on average. It was notable when both parents in a nuclear family lived long enough to raise their children to adulthood. Families of three generations tended to last only a short time because death claimed the older generation and many in the younger generations. Families of four generations were very rare.

Twentieth-Century Changes

China entered the twentieth century with the Qing dynasty (1644–1912) in near collapse and imperialist and colonial powers encroaching on China from all sides. Qing government leaders and revolutionary leaders alike searched in desperation for a way to save China from disintegration and foreign incursion. They considered importing foreign ideas and systems, such as foreign-style military and industrial production, a new form of government (a republic or a democracy), and modern educational systems. Leading thinkers also noted that China’s autocratic and patriarchal marriage and family system was a powerful force that prevented or slowed necessary change. They therefore adopted ideologies that would overhaul the traditional family system. In particular, Chinese Nationalist Party (Guomindang) leaders and Communist leaders opposed the practice of arranged marriage and supported equality between men and women. The Communists and the Nationalists also opposed the practice of female foot binding.

Marriage Law of 1950

China’s Communist government from the beginning was determined to overturn patriarchal family and marriage customs. In fact, the first major law passed by the People’s Republic of China (PRC) was the Marriage Law of 1950, which outlawed arranged marriage, prostitution, polygamy, child marriage, and concubinage; it allowed divorce and free choice of marriage partners and set a minimum marriage age of eighteen for women.
and twenty for men. The government promoted male-female equality and weakened the economic power of the family, especially by collectivizing agriculture under the commune system.

The system of marriage underwent a slow transformation under the government’s leadership during the second half of the twentieth century. The average ages at marriage rose slowly during the early PRC decades and rose rapidly during the 1970s. The average age at first marriage from 1929 to 1931 had been 17.5 years for women and 21.3 years for men. By the late 1990s the average age at first marriage had risen to twenty-two for women and twenty-four for men. Some marriages are still arranged by the families, but law requires that marriages be registered and that the bride and groom tell the registration official that the marriage is voluntary. Today some marriages are love marriages, freely chosen by two young people, but most marriages are contracted through a system of introductions in which family, friends, or colleagues bring the man and woman and their families together. After a number of meetings, if the man and woman and their parents agree, the marriage is contracted.

Marriage remains essentially universal: In 2005, 99.3 percent of women ages thirty-five through thirty-nine had married, as had 95.2 percent of men in that age bracket. The remaining single men could not marry because of China’s shortage of women caused by earlier female infanticide and maltreatment of girls.

**Positions of Men and Women**

Traditionally males were so important and females so unimportant that many family genealogies recorded only males, generation after generation, ignoring the female half of the family. The birth of a male was cause to rejoice; from birth sons were groomed for eventual dominance. If food or money for medical treatment were scarce, these commodities were directed toward the boys and men. As China’s economy has industrialized, most of the nonagricultural jobs have gone to men, and men are still regarded as a family’s economic core.

Since coming to power the Chinese Communist Party has worked against this formidable belief system and with significant positive results. But even today most families, particularly rural families, believe that they must have a son. Objective reasons exist, such as the lack of an old-age security system in rural China. Parents feel that they need a son to care for them when they grow old; a daughter will marry out of the family, but a son will bring in a daughter-in-law to help care for them. And yet even if such practical needs can be met in other ways, the emotional preference for a son remains.

**Infanticide**

During imperial times female infanticide was common at all economic levels. Selective neglect of daughters also meant that they died throughout childhood. During the Communist period the killing of infants was outlawed; female infanticide and maltreatment of girls declined
gradually. The lowest point of female losses occurred during the 1960s and 1970s, when excess female child mortality (mortality beyond the expected rates) killed about 2 percent of girls in each birth cohort. But after introduction of the one-child family-planning policy in 1978 and 1979, excess deaths of girls rose suddenly to 3 percent of each birth cohort. Since the 1980s technology that can be used for sex-selective abortion of female fetuses has led to major losses of females in utero. Since 1999 China has had at least 120 boys per 100 girls at ages 0–4, one of the world’s worst gender imbalances. Analysis of data from successive Chinese censuses indicates that life-threatening discrimination against females is now confined mostly to the prenatal period and the first couple of years of life. Girls still experience discrimination after that, but the most recent data indicate that it seldom leads to death after the first two years of life.

One Child per Couple

During the 1950s and 1960s women in China averaged six births each. After the famine of the Great Leap Forward the government began to take seriously the need to slow population growth. Cities conducted a rigorous campaign to persuade or require couples to have fewer children. By 1966 urban fertility decreased to three births per woman. Then, during the early 1970s, the government conducted an increasingly compulsory campaign in the rural areas, demanding that couples cease childbearing at three births, then two births. During the late 1970s, based on population projections, the government determined that the only way to stop population growth soon was to require all couples to stop childbearing after one child. Financial incentives were given to couples who pledged to have only one child, with special education and health benefits given to that one child. Couples who resisted the one-child limit were penalized with fines, the required use of an intrauterine device (IUD) after one birth, forced abortion, and required sterilization (usually of the mother) after two or more births. Rural fertility dropped from 6.4 births per woman in 1970 to 3.1 in 1977; urban fertility dropped further to 1.6 births per woman. The nation’s population growth rate was reduced from almost 3 percent per year during the late 1960s (for a population doubling time of about twenty-five years) to 1.5 percent during the 1980s (for a doubling time of just under fifty years).

The most intense campaign of involuntary family planning was conducted in 1983 as medical teams went to villages to carry out forced sterilizations, abortions, and IUD insertions. This campaign led to a popular backlash, and the government temporarily lessened the coercion. Meanwhile, an associated increase in female infanticide worried the government. The demand for a son among rural families was so great that most provinces changed their rural family-planning policies to allow couples who had a firstborn daughter to have a second child but adhered to the one-child limit if the first child was a son.

Since the 1970s China’s family-planning policy has required couples who want a child to apply for permission...
to become pregnant and give birth. If authorities give couples a "birth quota," couples may proceed to have a child; otherwise they face potentially serious political and economic consequences. Insertion of an IUD is required after one birth for most women, and sterilization is required after a second birth whether the birth was allowed or not. These "passive" techniques of birth control will stop pregnancy even if the couple actually wants a child, which is why the government usually insists on these techniques. Of couples who use contraception, 40 percent choose to have one partner sterilized, and 51 percent use an IUD. Since the early 1990s the nation's fertility level has been below replacement-level fertility at about 1.6–1.8 births per woman. Since 1998 the population growth rate has been 0.5–1 percent per year, which is very low for a developing country.

Some international funding organizations and some governments have condemned this compulsory and often coercive family-planning program. In response China is conducting a pilot program in selected locations to implement a more client-friendly family-planning program. The program allows couples more choices of birth-control techniques, but couples still are not allowed to have more children than permitted before. China is the only country that has a compulsory family-planning program.

China's low death and birth rates, however, have had mainly positive effects. Today most Chinese people live to advanced years. Therefore educational and health and other financial investments in children and adults pay off because the recipients live relatively long lives and thus can contribute longer to society. Small numbers of births, combined with rising incomes, mean that each child can receive more food, health care, clothing, education, and attention than was the case with larger families in the past. Low fertility reduces female deaths from pregnancy and childbirth and frees women to pursue careers and opportunities beyond childrearing. Nonetheless, in many ways compulsory family planning is harmful to families, couples, and women. Those couples who love children and want another are usually prevented from having more than their quota. Family-planning clinics use either X-ray or ultrasound to inspect the abdomens of women every few months to confirm that their IUDs are still in place; frequent use of X-rays may harm the women's health. Forced abortions are often performed during the second and third trimesters, which is dangerous for the health of the mothers. Even putting aside such health issues, compulsory abdominal X-ray or ultrasound inspections, IUD insertions, sterilizations, and abortions are violations of women's bodies and of their rights.

As in the past, almost everyone in China now marries, and almost every couple has at least one child. This fact means that the family structure is very much intact despite low fertility. People currently mostly live as part of an extended family, a "stem" family (three generations living together but with just one son and his wife and child or children in the household), or a nuclear family (parents and children only). Often the families of the older parents—the sons and their spouses and children and sometimes the married daughters in urban areas—continue to have frequent contact even if they live in separate dwellings.

Low fertility and mortality, however, mean that China's population is aging. The proportion of elderly will rapidly increase in future decades; there is concern that the smaller numbers of children and grandchildren will be unable to cope with or financially support their elderly family members; and there is serious doubt about the government's ability to step into the breach.

Family and Economic Reform
Since the death of Chinese Communist Party leader Mao Zedong (1976) and the implementation of economic reforms (1978–79), the proportion of the population living in urban areas has increased from 18 percent to 45 percent. Urban life has weakened the patriarchal nature of the family (partly because access to agricultural land is not a factor), raised the status of women, decreased illiteracy, and raised educational levels.

Urban living, with all of its modern and Western influences, has also begun to affect China's two-parent, one-child family structure: Divorce rates are rising in China's larger cities, thus making the patrilineal nature of the family even more vulnerable for a fast-growing section of the population. But compared to the United States, where roughly one-third of all first marriages end in divorce—and despite the "sanctioning" of divorce by the CCP in the reformed Marriage Laws of 1950—the divorce rate in China overall remains extremely low: 1.2 percent of men and 0.8 percent of women. (The unbalanced statistics reflect the trend for ex-wives to remarry more often after the break-ups of their marriages than ex-husbands.)
Economic reforms have renewed the power of the family in rural China because the rights to use agricultural land, to make decisions about its use, and to sell the products for profit have reverted to the family unit from the communal production team. Wealth and income again belong to the patriarchal family unit, although the gradual shift from agriculture gives some decision-making power to the men and women who earn outside income. Rural marriage is still usually patrilocal and patrilineal. Limits on permanent migration out of the village continue to reinforce the rural family’s control over its members. Although temporary migration from a village is allowed, most migrants must assume that they cannot permanently leave the rural areas.

China’s strengthened rural family today is, from an economic standpoint, a flexible and positive force in the midst of rapid economic change. The rural family keeps its tiny pieces of arable land and farms them but also frees up its surplus laborers to work in rural industry or services or to migrate for work. The family diversifies its sources of income and spreads its risks across different economic sectors and into different places. It pools its resources for goals of the family. It supports its dependents—children, elderly, the underemployed and unemployed, the sick and disabled. This support is important because barely any social safety net exists in China’s vast rural areas.

**Source of Stability**

Today China’s rural families are robust in the face of considerable uncertainty. The transition from agriculture to nonagricultural sectors of the economy in rural China is occurring inside the family, as it has for the last century in rural families of the United States. The strong family is also helping urban China survive the destabilizing storms of massive layoffs of workers in state-owned industries and widespread loss of medical insurance benefits.

China’s traditional marriage and family systems have been buffeted by political attacks, communal farming, economic development, legal changes, the rising status of women, and foreign ideas and influences. Some changes, such as the decline of arranged marriage, have been deep and real. Within today’s families decision making is less hierarchical and more shared and consultative than it was in the past. No longer is ancestor worship a strong belief system.

Despite the real changes, China’s patrilocal and patrilineal family remains strong. It has survived and has enjoyed renewal because it works. As China moves toward a market economy, millions of people have to change what they do to earn a living. Millions are displaced or sidelined during the transition, and the dislocation and confusion are profound. China’s people need their families to fall back on, and people are doing what they can to keep their families intact. Marriage and family are surprisingly strong in China today, and they show few signs of weakening.

Marriage, Imperial

Fēngjiān dìguó shìdài de hūnyīn
封建帝国时代的婚姻

In imperial China (211 BCE–1912 CE), the institution of marriage—which influenced succession and property rights—followed laws and customs based in both Chinese tradition and Confucian principles.

In Confucian China, as in most of the world, the family was the heart of society. Not surprisingly, many provisions in the legal codes of the successive dynasties dealt with the family. But customs and extralegal institutions including clans, guilds, and religious and professional associations also played important roles in the resolution of problems associated with disputes involving marriages, families, and property.

Among the five key human relationships in Confucian China, three pertained to the family: They were between parents and children, husband and wife, and elder and younger siblings. Reciprocal obligations governed the conduct of each person in a relationship, and in each case one party was superior to the other. For example, the parent, husband, and elder sibling were superior to the child, wife, and younger sibling respectively, assumed more responsibilities, and were accorded greater respect. The remaining two relationships were between ruler and subject, which paralleled that between parents and children, and between friends, a relationship essentially between equals. Confucian philosophy also taught that there were the Three Bonds that were fundamental in human society: They were between the ruler and subject, parents and children, and husband and wife. The fact that two of these three pertain to the family further bolsters the importance of that institution.

Marriage

The Chinese family was patrilineal, that is the main line was traced through the male, and patrilocal, meaning that a woman left her natal family to live with her husband’s family. She was subordinate to both her husband and his parents, but her status in her new family rose with age and the bearing of children, especially sons. Marriages were arranged by family elders, often through go-betweens; many among them were female professionals and were paid for their services. A betrothal involved presents from the groom’s family to the prospective bride, and there was sometimes a written contract. The breaking of a betrothal was a serious matter that could result in litigation. A bride entered marriage with a dowry, usually consisting of jewelry, clothing, and furnishings. Rarely did she receive landed property from her parents, because farm land and real estate usually went to male children. Although a married woman retained her own surname, her children took the surname of their father. If the bride had no brothers, a marriage contract could stipulate that the groom take up residence with his wife’s family and that their children assume her surname and inherit her property. Technically the husband controlled the money assets that a wife brought to a marriage.

The governments of successive dynasties strongly encouraged the institution of marriage and the raising of families, sometimes by drastically raising the poll tax on
unmarried adults. Most marriages were monogamous, although wealthy men sometimes took concubines. Although multigenerational extended families were exalted, in practice most ordinary people lived in nuclear families or three-generation families.

Divorces were permitted and could be initiated by either party, but were rare because a divorce involved not just two individuals but also their families. A husband could divorce his wife more easily than she could divorce him, and such issues as unfilial behavior towards his parents, barrenness, and incurable disease were legitimate reasons. Barrenness was seldom a cause for divorce, however, because often a husband would take a secondary wife or concubine, whose son would be “adopted” by his wife as their heir; alternately a boy who belonged to the same lineage as a husband would be adopted as an heir. But the legal codes of dynastic China protected a woman in marriage by prohibiting her husband from divorcing her under three circumstances: if she had observed mourning for either of her parents-in-law, if her husband’s family had risen in wealth and position since their marriage, or if she had no family of her own to return to. A wife could obtain a divorce with the intervention of a magistrate and for causes such as abuse or abandonment. Divorces were also permitted by mutual consent.

Women, especially those from middle- or upper-class families, were discouraged from remarriage upon widowhood. Many communities in premodern China erected tablets and arches to commemorate the lives and actions of chaste widows. Men, however, were under no such restrictions, and young widowers usually remarried. Although men clearly enjoyed rights superior to those enjoyed by women, Chinese society and families also practiced a division of labor where the wife and mother controlled the household. Sons, daughters, and daughters-in-law also owed obedience to both parents.

Succession and Property

Feudalism, where children inherited the status and rank of their fathers, had declined during the later centuries

One of the wedding traditions of wealthy families in imperial China was to transport the bride to her in-law’s house in a sedan chair.
of the Zhou dynasty (1045–256 BCE) and ended with the Qin unification of China in 221 BCE; it was only briefly and partially reinstated during the Han dynasty (206 BCE–220 CE). Therefore succession by sons to a father’s position involved only the ruling families and a small number of nobles. Even among the royalty and nobility a man had only one wife, although his rank and the need to ensure the succession allowed him to have secondary consorts or concubines. Primogeniture prevailed: that is, the eldest son of the wife was heir, and if she had no son, the sons of the secondary consorts would succeed according to age and sometimes the rank of the mother. Occasionally the sons of a high-ranking official were entitled to hold a junior office without qualifying for it through the civil service exams.

Since traditional China was mainly an agricultural state, land was the main source of wealth. Daughters rarely received a portion of their parents’ landed property; usually this happened only if she had no brothers. The daughter’s inheritance was generally her dowry. All sons, including sons born by concubines, usually received equal shares of the parents’ landed property, with the eldest son sometimes receiving somewhat more because he usually assumed additional responsibilities in caring for aged parents and in conducting rites of ancestor worship. A widow received her deceased husband’s share as guardian for her minor sons. She would forfeit that right if she remarried. As a result of the custom that divided landed property among male heirs, huge landed estates were rare in imperial China.

Both legal statutes and customs played key roles in governing the lives of men and women. Most laws upheld customs and the moral consensus. As in other spheres of activity, men and women in imperial China tended to settle their disputes through arbitration and informal means, going to the courts only as a last resort. Finally, the fundamental principles that governed interpersonal relationships were based on Confucian ethics and predicated on hierarchy and reciprocity with the goal of achieving social harmony.

Martial Arts (Wushu)

Movements originating in fighting systems developed throughout China’s history have been stylized into routines touted for individual physical fitness and psychological well-being as well as contact sports and competitive exhibitions. China’s martial arts influenced those of other countries and have inspired literature and movies.

Wushu is a Chinese term usually translated as martial arts. Wu is associated with military and warfare; shu with the skill, way, or methods of doing an activity. Wushu describes Chinese martial traditions from their origins in early stone-age cultures to a wide variety of martially-inspired practices seen today. (The term gongfu, or kung-fu, often used in the West to refer to Chinese martial arts, is composed of two Chinese characters referring to the time and effort required to accomplish a task. The term can be applied to any human activity and is applied to martial arts only because of the time and effort required to become skilled in these arts.) Wushu, although primarily focused on fighting arts, has also long been associated with physical conditioning, dance, drama, meditative exercise, and competitive exhibition. The sophisticated repertoire of techniques coupled with philosophies of self-cultivation make wushu a vital aspect of China’s culture. Wushu has influenced the martial traditions of neighboring countries and eventually the rest of the world.

Origins and Development

The technological and social changes that have occurred during China’s long history are mirrored by the evolution of Chinese martial traditions. Fighting arts required a variety of defensive and offensive specializations, from basic hand-to-hand combat to complex techniques of large-scale warfare. An overview of the development of Chinese wushu helps clarify the significance of today’s martial arts.

Originating in the need for protection against other people and dangerous animals, Chinese martial systems naturally grew more complex as Chinese society grew more complex. The first fighting methods were designed for hand-to-hand combat: techniques were developed that used the hands, feet, elbows, knees, and head. These early skills were refined and supplemented by the use of hunting and farming tools made of wood and stone, including the club, spear, and knife. As metals came into use and basic technology developed, a variety of weaponry became available. Chinese society came to place more and more emphasis on warfare, and the martial arts became a specialized profession for many. With the advent of modern firearms in China, traditional martial arts were more commonly practiced as forms of exercise and sport.

Rudimentary forms of Chinese martial arts developed in the early Neolithic period. Basic fighting methods served to protect individuals, families, and clans. They also provided entertainment, as in games of “head buttting” in which contestants donned animal horns. By the Zhou dynasty (1045–256 BCE), wushu had already reached
A man practices martial arts in the morning on the grounds of the Temple of Heaven in Beijing. Photo by Tom Christensen.

...
But all too often the imperial political–military structure crumbled, leaving the commoners to fend for themselves. Other groups developed their own highly effective fighting systems. These groups often organized themselves around a common social bond, be it linguistic, social, or philosophic.

Because specially gifted individuals are credited with the creation of specific martial systems, their own families often retained hold of the tradition by passing on their knowledge from generation to generation. Their concerns were primarily for the security of family and clan. Their limited resources kept their focus on developing skills an individual fighter could employ, including weapons such as sword, spear, or knife. The conflicts they encountered were often with individuals or with small groups, so open-hand boxing skills were also of great importance.

Martial art styles were usually named for the people, places, or philosophic ideas associated with them. There are a few hundred known Chinese styles, but many more styles and substiles remain to be categorized. For simplicity, martial art styles are sometimes placed into general categories, such as Northern/Southern, Internal/External, or Daoist/Buddhist, and sometimes they are categorized according to their place of origin. The modern nanquan style of martial arts is derived from techniques developed in southern China.

Some Chinese martial arts developed in association with religious centers. Temples were often places of refuge during times of turmoil. They attracted a variety of people from all segments of Chinese society, including martial experts who came from near and far to live together, often discussing and comparing their knowledge. Some temples, such as the Buddhist temple of Shaolin in Henan Province, became universities where leading experts contributed to the preservation and evolution of the martial arts. The modern changquan style of martial arts is derived from techniques developed in southern China.

The modern changquan style of martial arts is derived from techniques developed in southern China.

China exemplified refined culture to surrounding Asian countries for many centuries. This holds true for Chinese martial traditions as well. The martial arts in Japan, Korea, and Indonesia, for example, were influenced by encounters with Chinese people, such as those occurring during trade, immigration, or war. Okinawan karate derived from China’s Fujian Province; the founder of Korean tae kwon do studied wushu while serving in the military in Manchuria.

Some martial traditions have become extinct due to the rise of modern weaponry. Nonetheless, in China many martial arts remain intact. The continued popularity of these arts is due, in part, to their pervasive presence in Chinese culture. Their historical importance has been the subject of many literary endeavors, including a separate martial arts genre. As moving art forms, the martial arts are valued living expressions of their developers’ creativity and genius. Martial art forms are also cherished for their therapeutic benefits, and in China the majority of people practicing a martial art do so primarily for this reason. However, the martial arts can be found in theatrical productions, self-defense classes, military training programs, entertainment industries, meditative practices, and sporting events. Knowledge of Asian martial arts likewise spread to the rest of the world, the movie industry being the most significant popularizer.

Modern Competitive Sport

Martial art exhibitions are a long-standing tradition in China. Competitions were held regularly in provinces, and now national and international competitions are held. Routines standardized by government regulations are taught in specialized martial art schools and in colleges having departments dedicated to wushu. Martial arts training is still held at Shaolin Temple.

Competitive martial art exhibitions have transformed traditional solo routines by selectively adapting elements from traditional systems and by incorporating gymnastic elements for greater visual effects. Matches between individuals, usually judged on a point system, place limitations on the type of techniques used. Taolu (forms) comprise basic movements (stances, kicks, punches, balances, jumps, sweeps, and throws). Competitions often highlight two major categories: changquan (long fist) and nanquan (southern fist). Changquan, the style associated with Shaolin monks, involves whirling, running, leaping, and acrobatics. Nanquan style, based on styles developed in southern China, is typically less acrobatic than changquan and features low stances and intricate hand movements. Taijiquan style is famous for its slow movements. Routines of any style may include stylized use of a “weapon.” For example, qiangshu is a changquan style using the qiang, or spear.
Sanchu (sparring) is another wushu event. This sport was influenced by Chinese boxing and Chinese wrestling. Both men and women compete.

The 2008 Beijing Olympic Games Wushu Tournament, although not an official Olympic event, was sanctioned by the International Olympic Committee. Wang Xiaolin, secretary general of the International Wushu Federation and president of Chinese Wushu Association, described this tournament not only as a showcase but as a way to promote world understanding of Chinese culture. Taolu events for men and women (ten gold medals) included all three categories of forms. There were Sanchu events in three weight classes for men and in two weight classes for women, awarding a total of five gold medals. China led all countries in the number of medals won at this tournament, with eight of the fifteen gold medals. (Russia was second in medal count with two gold and three silver medals.)

Outlook

The martial arts are practiced for a variety of reasons in all parts of the world today. Some are either attracted to wushu or seek to suppress its practice because of its perceived violence. Martial sports competitions draw enthusiastic crowds. Such sporting events range from full-contact bouts with no rules, to no-contact tournaments with rules to prevent injuries and to ensure fairness in judging. The Beijing Olympic Games Wushu Tournament drew contestants from forty-three countries, a testimony to wushu’s international popularity; there is a need, however, for a single internationally recognized system for teaching, ranking, and judging. Still others desire to learn martial arts for the many potential physical and psychological benefits offered. Taijiquan, with its slow movements, is especially suited for the elderly. Martial arts studios for children promote the confidence-building aspects of the discipline. More than ever, individuals are attracted to the study of wushu not simply as a physical activity, but as a way of self-discovery.

William Alexander Parsons Martin was a Presbyterian missionary and a pioneer in modern Chinese state education. Through his translations and his work as an educator, Martin contributed to China’s growing global engagement during the late nineteenth century.

William Alexander Parsons Martin was born in Livonia, Indiana, into a family with strong ties to the missionary movement. He arrived in China in 1850 and worked until 1860 as a missionary in Ningbo, where he wrote his famous *Tiandao suyuan* (*Evidences of Christianity*). During these years he believed that the Taiping Rebellion was a means of creating a Christian China. In 1863 Martin founded the Presbyterian mission in Beijing soon after the city was opened to foreign residents. His work as an interpreter for the Sino-American Treaty of 1858, and his friendship with Robert Hart, an Irish-born diplomat who served in China, and the U.S. minister to China, Anson Burlingame (1820–1870), provided him with contacts to the Zongli Yamen, the new ministry responsible for foreign affairs. Under its tutelage Martin completed a translation of Henry Wheaton’s *Elements of International Law* (1836) into Chinese in April 1865. From 1869 to 1895 Martin served as president of the Tongwenguan, a school established in 1862 to help prepare Manchu and Chinese students for a career in the diplomatic service. During the 100-Day Reforms in the summer of 1898 Sun Jianai (1827–1909), president of the recently founded Imperial University (later Beijing University), asked Martin to serve as head of faculty.

When Boxer militias, obviously supported by the Chinese government, laid siege to the legation quarters in Beijing in June 1900, Martin was among hundreds of foreigners and Chinese Christians who had barricaded
themselves for weeks in the British legation. This experience briefly altered Martin’s usually optimistic stance on China. In his eyewitness account, Siege in Peking, and several newspaper articles he demanded punishment for China’s violations of international law. Martin, however, soon reversed his gloomy outlook, fully applauding the Chinese government’s post-Boxer reforms. From 1902 to 1905 Martin acted as head of the reformer Zhang Zhidong’s new university in Wuchang. From 1906 to his death in 1916 Martin served as an honorary missionary for the Presbyterian mission in Beijing.

In his sixty-six years in China Martin played an important role as a crosscultural communicator. His Chinese publications on law and modern science were meant to disperse what he considered to be Chinese superstitions and to demonstrate Western civilization as a harmonious interplay of the sciences and Christianity. His English publications, frequent articles in the New York Times, and several well-received books and research papers introduced Chinese civilization in a comparatively positive light. As a missionary, Martin played the role of a well-known maverick. His acceptance of Darwinism and his view of both Buddhism and Confucianism as meaningful predecessors to Christianity were not generally shared. His willingness to accept Chinese ancestral rites as generally compatible with Christianity and to bow in front of an image of the philosopher Confucius (551–479 BCE) during school ceremonies repeatedly scandalized the missionary community in China.

Throughout China’s long history massage has often been used by Chinese as a conservative treatment for many ailments such as sprained joints and impaired circulation. Developed around the ancient Chinese principles of yin and yang and the concept of qi, or life force, therapeutic massage remains a popular medical technique today.

Archaeological studies have shown that as early as 2700 BCE the Chinese in the Huang (Yellow) River Valley were using massage for healing purposes. During the period of Warring States (475–221 BCE), Bian Que, a legendary physician, was said to have used massage and acupuncture successfully to treat a patient suffering from shock. Today massage therapy is widely used as an alternative to surgical procedures and chemical treatment for a number of ailments and medical conditions.

The principles of massage developed alongside the basic principles of traditional Chinese medicine. The first principle is the theory of yin and yang. Simply stated, the concept of yin and yang in medicine accepts that the organs of the body are interrelated and that illness is caused by an imbalance in yin and yang, opposite yet complementary influences. The second basic principle is the belief in the flow of qi (vital energy, or life force) through certain channels of the body and through the collaterals, small blood vessels that the body develops and which can bypass a blockage in a larger blood vessel. In accord with
these beliefs, massage is thought to not only heal an injury at one particular location but also influence the entire body or parts of the body through encouraging energy to flow through the channels and collaterals that regulate the balance of yin and yang. Massage, then, is used to stimulate circulation, heal injuries, and treat disease.

Techniques in Chinese massage include rubbing, stroking, kneading, and tapping with the hands as well as with the healer’s arm and elbow on the patient’s body and extremities. The effect of manipulation through massage is directly related to the technique used—mild or powerful manipulations, vigorous or soft performance, quick or slow frequency—thus directing the flow of qi.

Therapeutic massage is used in China as a conservative treatment for orthopedic disorders such as tight shoulder muscles, lumbago, protrusion of a spinal disc, and joint sprains. Chinese orthopedic surgeons do not consider therapeutic massage and surgical treatment as opposites, but as complementary treatments. Therapeutic massage, using only the doctor’s hands, relieves the patient’s pain and avoids the side effects of chemical agents, such as repeated local injections of steroids. It can also frequently eliminate the side effects of unnecessary surgical procedures. In most Chinese hospitals today, a section of massage treatment is often affiliated with the department of physical therapy.

Sun Yat-sen died in 1925, and four years later his mausoleum was completed in Nanjing City. The mausoleum has become a sacred place for Chinese separated by the Taiwan Strait. Magnificently designed, from the steps to the tomb itself, meanings are embedded in the architecture honoring the founding father and his comrades who fell in the fight against Qing rule.

Sun Yat-sen, forerunner of the revolution against the Qing dynasty (1644–1912) and founder of the Republic of China, died of liver cancer in Beijing on 12 March 1925. Before his death he expressed the desire that his body be buried on Mount Zijin (Purple Mountain), also known as Mount Zhong (Bell Mountains), in Nanjing, capital of the Republic of China. His body was temporarily kept in the Biyun Temple (Temple of Azure Clouds) on the Xiangshan Mountain (Mount Fragrance) in Beijing until his official burial in Nanjing.

Building of the Mausoleum
On 5 May 1925, an advertisement was made to invite architects from home and abroad to design a mausoleum for Sun. Lu Yanzhi (1894–1929), a graduate of Cornell University and a renowned architect of modern China, was selected. Construction of the mausoleum began in June 1926 and was completed in the spring of 1929. The train that carried Sun’s body left Beijing on 26 May and arrived in Nanjing two days later. The body was then moved along a boulevard built specifically for that purpose, named Zhongshan Lu (Sun Yat-sen Road,) to the mausoleum site. A public memorial service was held for three days before Sun was laid to rest on 1 June 1929 in what is officially known as the Mausoleum of Dr. Sun Yat-sen.

Architecture of the Mausoleum
The mausoleum was built inside a cemetery park that occupies an area of about 7,413 hectares (18,317 acres) and extends north from the entrance toward the foot of Mount Zijin, against which the mausoleum structure rests. Seen from an aerial perspective the park evokes the shape of an alarm bell, representative of Sun’s call to action in behalf of the Chinese people. Along the axis of the symmetrically designed site is a string of buildings approached from an open paved space in the shape of a half-moon, the curved bottom of the bell. From there, in order, are a gateway, a gatehouse, a stele pavilion, a mourning hall, and lastly the mausoleum.

From the half-moon open space a three-lane, 392-step path of more than 480 meters (1,575 feet) leads upward toward the tomb, and is flanked by rows of trees. The concrete middle lane is 12 meters (39 feet) wide, and each of the asphalt side lanes is 4.2 meters (13.7 feet) wide. At the start of the tomb path towers a granite paifang (a memorial gateway in the Japanese torii style) with three arches.
Written on the transom of the middle arch is Dr. Sun’s motto: *bo’ai* (universal love). Next is the gatehouse, which is 16.5 meters (about 54 feet) high and 27 meters (about 88 feet) wide and has three archways. A path leads to a three-arch tomb gate, serving as the entrance of the mausoleum. Above the middle arch is a slab inscribed with Dr. Sun’s maxim: *Tianxia wei gong* (All under the sun is for the welfare of the public). Not far behind the gatehouse stands the granite pavilion housing a stele that is 9 meters (about 29 feet) tall and 4 meters (about 13 feet) wide. An inscription on the stele reads: “The Nationalist Party of China has buried Mr. President Sun Yat-sen here on the first day of the sixth month in the eighteenth year of the Republic of China.” The Nationalists did not eulogize Sun at length, as tradition dictated, arguing that no words could praise him enough.

After the stele pavilion the tomb path, with 290 steps left, becomes steeper, punctuated with eight platforms. On the fifth platform sit two large copper ding (tripod caldrons), donated by the then Shanghai municipal government. Two holes are visible in one of them, created by the shrapnel of the Japanese army sacking Nanjing in 1937. A pair of stone lions rests on the seventh platform.

At the end of the tomb path is the Mourning Hall, 30 meters (98.4 feet) long, 25 meters (82 feet) wide, and 29 meters (95 feet) high. Combining Chinese and Western styles, the Mourning Hall has a double-eave saddle roof and three archways decorated with copper latticework on the top. Above the archways is engraved the creed of the Kuomintang (Taiwan’s Nationalist Party)—“Nationalism, Democracy, and People’s Livelihood”—which are the Three Principles of People put forward by Sun Yat-sen. Hanging between the eaves is a board bearing Dr. Sun’s handwriting that reads: *Tiandi zhengqi* (Uprightness between Heaven and Earth). Outside the hall a pair of 12.6-meter-tall (about 41 feet) huabiao (ornamental columns) guards it on either side. Inside, twelve marble columns hold up the hall. Ceramic tiles cover the floor and ceiling. The ceiling tiles form a mosaic.

---

The Sun Yat-sen Mausoleum, located in Nanjing, painted by Fu Pao-Shih (1904–1965), head of the Kiangsu Academy. The mausoleum was under construction for three years before its completion in 1929.
depicting the Kuomintang’s flag, a white sun in a sky-blue field. The upper half of the walls is decorated with artificial marble; the lower half, with black marble. A 4.6-meter-tall (15 feet) statue of Sun Yat-sen sits in the center of the hall. It was carved by the famous French sculptor Paul Arinsky from Italian white marble. Looking forward in his long gown, Sun holds an open book on his lap, signifying his wisdom. Around the foot of the statue, six relief sculptures represent some of his revolutionary activities. The Outline for National Reconstruction, drawn and penned by Sun, is inscribed on the walls on either side of the statue.

Behind the statue on the back wall of the Mourning Hall, a doorway opens to the tomb itself. Inscribed on a board above the two-leaved copper door in the front is, “Their noble spirits live forever,” which Sun had dedicated to those who died in the fight against the Qing army. On the single-leaved copper door behind are etched the characters, “The tomb of Mr. Sun Yat-sen.” The well-lit hemispherical burial chamber, forming the top of the bell seen in bird’s eye view, is 18 meters (59 feet) in diameter and 11 meters (36 feet) high. Its three-layered walls are fortified with granite, armored concrete, and artificial marble. A circular marble pit 4.3 meters (14 feet) in diameter and 1.6 meters (about 5.2 feet) deep is at the center of the chamber. It is surrounded with railings and floored with white ceramic tiles. A sarcophagus with a marble statue of Sun Yat-sen lying on top of it is situated in the pit. The statue was carved by a Czech sculptor known as Gorch. Some 5 meters (16.4 feet) beneath the sarcophagus, Sun’s body rests in an American-made copper coffin, 2.24 meters (about 7.35 feet) long, 0.8 meter (2.6 feet) wide, and 0.65 meter (2.1 feet) tall.

There are many auxiliary memorial buildings in the cemetery, including the Cottage of Eternal Admiration, the Burial Museum, the Buddhist Scripture Pavilion, a bandstand, and several other structures.

Recent Activities at the Mausoleum

Since the completion of the mausoleum, Chinese people have come to visit it every day. On 27 April 2005, Lien Chan, chairman of the Kuomintang, made his party’s first visit to the site since 1949. A week after the Kuomintang won the election and came into power again in Taiwan on 20 May 2008, Chairman Wu Poh-hsiung and his entourage came to the mausoleum to visit Sun. Surprised by the structure’s excellent condition, Wu was profoundly thankful to the Nanjing people for taking good care of it in the past decades.

China changes constantly, and the Encyclopedia of China will change and grow, too. Berkshire’s authors and editors welcome questions, comments, and corrections: china.updates@berkshirepublishing.com.
Located at Lintong in Shaanxi Province, the mausoleum of the first emperor, Shi Huangdi of the Qin clan (reigned 246–210 BCE), is the site of one of greatest archaeological finds, in terms of physical content and historic importance. Most famous is 8,000-troop army of life-size terracotta figures—cavalry soldiers and infantrymen, horses and chariots—all positioned in proper military order.

The gigantic earth mound marking the underground burial chamber is 350 meters long on each side. The height of the mound is about 52 meters. A passage in the historian Sima Qian’s Shiji (Records of the Historian) recorded the grandeur of the burial chamber, noting that the chamber contained waterways filled with mercury, terrestrial topography, and depictions of heavenly constellations illuminated by candles made of whale oil so they could burn forever.

Sima Qian’s description has fascinated readers for more than two thousand years. Archaeological surveys and remote sensing technology in 2002 provided us with more tangible details of the lavishly constructed mausoleum. A massive sloped wall some 30 meters high, constructed with the pounded-earth technique, was detected above the burial chamber, which measures about 170 meters from east to west and 145 meters from north to south. Discoveries of fragments of ceramic tiles near the wall further indicate the existence of a large-scale underground palace beneath the mound.

Since the discovery in 1974 of the underground terracotta army located east of the burial mound outside the wall, Chinese archaeologists have uncovered more remains beyond those enclosed within the wall, suggesting that the first emperor’s mortuary precinct was far grander than previously believed. One hundred eighty-one pits (chambers) designated for different purposes have been found so far in an area of 56 square kilometers in and out of the mortuary precinct of the mausoleum.

To the west of the outer wall are cemeteries of workers and prisoners and sacrificial tombs. Sacrificial and animal tombs are located to the north. To the east are the famous terracotta army pits, including pits 1, 2, and 3, one unfinished pit, and other sacrificial tombs, including nearly one hundred chambers containing terracotta grooms and sacrifices of horses. Inscriptions on objects from those pits suggest the horses were part of the imperial stable.
In the western area between the inner and outer walls, from north to south, an administrative building site, administrative sites of mess officers, an accompanying cemetery, sacrificial animal pits, and stable pits have been identified. In the southeastern corner between the inner and outer walls are three pits: K9902, K9801 (pit of stone armor and helmets), and K9901, containing a bronze ding (three-legged cauldron) and terracotta acrobats.

Remains of a side hall and an accompanying cemetery were found to the north within the inner wall. The mausoleum in the central south is surrounded by a retiring hall in which the soul of the emperor could rest, more sacrificial pits, a bronze chariot pit, and a terracotta figure pit (K006). Archaeological surveys have found many other remains whose structure and function have not been fully identified yet.

**Bronze Chariot Models**

Two painted bronze chariot models, half the size of real chariots, were found in 1980 west of the burial mound within the inner wall. Each chariot, driven by a charioteer and pulled by a group of four horses, was intended to be the transport of the first emperor in the afterlife. Both chariots were primarily decorated with cloud motifs and geometric designs such as diamonds and squares and mainly painted with blue, green, and white colors, creating a dazzling effect. These two bronze chariots exemplify the excellent workmanship of that time. Each consists of 3,400 bronze parts, but one chariot is furnished with an additional 1,720 gold and silver ornaments.

Pit K006, south of the burial mound, was discovered in 2000. It contains twelve life-size standing terracotta figures, four bronze yue axes, a wooden chariot, and twenty horse sacrifices. Among those twelve figures, eight represent Qin government civil officials (identified by the ceramic knife hanging on their waist). More sacrificial pits, remains of architecture, and accompanying burials have been located north of the burial mound within the inner wall.

Pit K007 was discovered in 2001 between the inner and outer wall at the northwestern corner. An interesting discovery from this pit is forty-six vividly depicted bronze swans, geese, and a crane, all of which were displayed on each side of an artificial river. Fifteen additional terracotta figures in kneeling and sitting poses were uncovered from the same pit, suggesting they were hunters. The bronze crane, originally painted and carefully rendered in detail with feathers, stands elegantly on a cloud, indicated by two separate bronze bases attached to its feet. Its naturalistic depiction makes it a masterpiece of Qin dynasty art.

Historical records show that 720,000 laborers were conscripted from all over the Qin dynasty to build the mausoleum. The most impressive and best-known discovery in the underground complex is an 8,000-troop terracotta army. Photo by Yixuan Shuke.
The artist captured the moment that the crane plucked a worm from the water.

Representations of acrobats in different motions were found in pit K9901 southeast of the burial mound between the inner and outer wall. Each of the eleven painted, life-size terracotta figures is dressed in a tunic, with a robust body and a naked torso. A large bronze ding of 212 kilograms, likely used by the acrobats for a weightlifting performance, was found in the same pit. Another large pit, K9801, north of pit 9901, has yielded 150 suits of stone armor, 50 stone helmets, and a set of horse body armor. The suits of armor, composed of small pieces of stone plaques, were carefully sewn together with bronze wires.

Terracotta Army

The most impressive and best-known discovery in the mausoleum complex is the massive underground terracotta army from three pits 1.5 kilometers east of the burial mound. The incredible scale and grandness of the army have earned the army the title “eighth wonder of the world.” A museum has been built on site to protect this great cultural heritage and to allow tourists to visit.

The three pits are tunnel-like structures with brick floors separated by partitions constructed with pounded earth and covered by logs and lined with mats. Pit 1 is the largest, containing about six thousand terracotta figures, chariots, and horses all arranged in battle array in eleven trenches. They are identified as the replicas of the right imperial army, including cavalrymen and foot soldiers. Pit 2, in an irregular “L” shape, is about 20 meters north of pit 1. It was furnished with 1,400 figures arranged in four sections. In the eastern section are archers in standing and kneeling poses; in the southern section are war chariots each drawn by four horses; in the central part of the pit is a mixture of chariots, foot soldiers, and mounted soldiers; in the northern section are cavalrymen. They are the left imperial army. Pit 3, northwest of pit 1, covers an area of 524 square meters and contains sixty-eight soldiers, one chariot, and four horses. It is identified as the headquarters of the whole army. Unfurnished pit 4 was meant to contain the replicas of the central army. Some forty thousand bronze weapons were unearthed from three pits, giving us a comprehensive view of the armaments of the Qin dynasty.

Thousands Conscripted

The magnitude and diverse physiognomy of the terracotta warriors amaze many people. Manufacturing an army of eight thousand figures must have been a large-scale production supervised by the Qin central administration. Historical records show that 720,000 laborers were conscripted from all over the Qin dynasty to build the mausoleum. The project took thirty-seven years. The mobilization of resources and laborers for this project was unprecedented in Chinese history. Some eighty names were inscribed on the terracotta warriors, giving us some clues about the craftsmen who created them. Some artists came from the workshop at the Qin court; some were recruited from the area of the Qin capital Xianyang; artists from municipal and community workshops were also involved.

Although some body parts of the figures, such as the torsos, heads, and hands, were molded, headgear, attire, and facial features were carefully rendered in detail to show the rank and function of the individual soldiers. Bright colors such as red, blue, green, purple, and orange were applied originally on different parts of the sculptures to distinguish the armor and robe worn by the particular rank of the soldiers. Scholars have suggested that the color was applied in several steps: First a layer of lacquer was applied, followed by a white layer of coating; on top of that colors were brushed on.

Terracotta horses from the mausoleum of Qin Shi huang. PHOTO BY PAUL AND BERNICE NOLL.
The first emperor’s underground kingdom is not just the reflection of his religious belief and his quest for immortality during the Qin dynasty but also an extravagant display of his ambition to rule China forever.

Mawangdui Han Tombs

Three tombs of the Western Han dynasty (206 BCE–220 CE) have been discovered at Mawangdui in the eastern suburb of Changsha in Hunan Province. They belonged to the marquis of Dai, Li Cang, his consort, Lady Dai, and their son. These tombs have thousands of artifacts including bamboo objects, lacquerwares, musical instruments, ceramic vessels, wooden figures, silk paintings, garments and manuscripts.

The three Han dynasty (206 BCE–220 CE) tombs at Mawangdui in the eastern suburb of Changsha in Hunan Province belonged to the marquis of Dai, Li Cang (tomb 2, d. 193 BCE), his consort, Lady Dai (tomb 1, d. after 168 BCE), whose name was Xin Zhui; and their son (tomb 3, d. 168 BCE). These burials, excavated from 1972 to 1974, were rectangular earthen pits with a ramp in the north and by two huge earthen mounds on the top, each about 40 meters in diameter and 16 meters in height.

The tomb of Lady Dai was the largest of the three, measuring 19.5 meters from north to south and 17.8 meters from east to west. The burial chamber was filled with 10,000 kilograms of charcoal and sealed with white (gaoling) clay 1–1.3 meters thick, a practice aimed at creating an environment with a stable temperature and humidity so the body of the deceased and accompanying burial goods could be well preserved. Astonishingly, the body of Lady Dai has survived more than two thousand years. In the four compartments of the outer coffin (guo) were fourteen hundred burial goods, including bamboo objects and strips, lacquerware, musical instruments, ceramic vessels, silks, and wooden figures. Among the burial goods was a plain silk garment described in the archeological report as “as thin as a cicada wing” and “as light as the mist.” It weighs only 49 grams, a marvelous example of advanced silk-making technology in early Han China.

The body of Lady Dai, dressed in two garments and wrapped in eighteen layers of shroud, was laid in four layers of painted coffins. The outermost coffin was painted with black lacquer, the second with more than 110 scenes showing mythical animals and figures traveling in clouds against a black background, and the third with auspicious motifs, including dragons, tigers, vermilion birds, and mythical figures in a vermilion ground. The innermost coffin was decorated with brocade and tied with six to seven layers of silk ribbons. A T-shaped silk painting about 2 meters long was draped over the innermost coffin. It is identified as feiyi (a flying garment) by some scholars based on the inventory list of the burial goods recorded on the bamboo strips. The painting was likely a funerary banner that depicted the soul of Lady Dai traveling from the underground to the world of the living and ascending to heaven. The underground world depicted in the lower section of the painting includes water creatures and a robust man holding the Earth; the middle section of the painting framed by two intertwined dragons in a bi (disk) represents the world of the living, showing family members mourning the death of Lady Dai and a portrait...
of her; on the top is the representation of heaven inhabited by dragons in swirling clouds and deer-like creatures ridden by mythical figures. A mythical figure shown entwined by a snake and identified as Fu Xi (male) or Nu Wa (female), the progenitor of the Chinese, stands in the center of heaven flanked by the sun with a raven and the moon; a toad appears at each corner.

The tomb of the marquis of Dai, tomb 2, has been severely looted. A major discovery from tomb 3 is twenty-eight individual manuscripts written on silk (boshu). Those manuscripts include different editions of ancient classics, such as the Zhouyi and Laozi, covering politics, warfare, astronomy, medicine, nutrition, physiognomy (the art of discovering temperament and character from outward appearance), and divination. Many of these editions had been thought to be irretrievably lost.

In addition, five hundred lacquerware items, including food and wine containers as well as furniture, were discovered in tombs 1 and 3. Many of them were manufactured at the official workshops at Chengdu, a major center of lacquer production in the Han dynasty.

May First Labor Festival

Wǔ Yī Guójì Láodòngjié

The International Labor Day, known in China as the May First Labor Festival, or simply May First, is celebrated in previous and present Communist countries, although it originated in the United States.

International Labor Day is celebrated in China and many other countries on 1 May. The Chinese customarily call it Wuyi Lao dong ji e (May First Labor Festival) or simply Wuyi (May First). Ironically, the United States, where this international festival originated, celebrates its own Labor Day on the first Monday of September.

In the nineteenth century, working conditions in the industrial West were miserable. Workers labored from ten to sixteen hours a day. They struggled constantly to get their employers to sanction an eight-hour workday. In 1884 the Federation of Organized Trades and Labor Unions, which later became the American Federation of Labor, resolved that from 1 May 1886 eight hours would constitute a legal day’s labor. That day more than 300,000 workers across the United States went on strike. On 3 May violence broke out at the McCormick Reaper Works, in Chicago, resulting in the death of six strikers at the hands of the police. The next day, while a protest against police brutality was going on at the Haymarket Square, a bomb exploded and killed a police sergeant. In response the police fired back, and a conflict between the two sides left seven policemen and four workers dead. Later four strike leaders were tried and hanged for the incident.

In 1886 the Geneva Congress of the First International, led by Communist leaders in Europe, proposed that eight hours be the legal limit of a workday. In 1889 the restructured International, later known as the Second International, decided in Paris to set aside 1 May as a day when workers of the world gathered to fight for the eight-hour workday. In countries such as China, Vietnam, Cuba, North Korea, and those in the former Soviet Bloc, 1 May has since become an official holiday.

In the 1950s China celebrated the May First Labor Festival by staging an annual parade in Beijing and other major cities. Model workers were sometimes given the honor of standing among national leaders on the Tiananmen rostrum in recognition of their exemplary performance. This tradition of publicly awarding model workers as a part of the Labor Festival remains, though ceremonies vary as time changes. Today it usually takes the form of a meeting broadcast from the Great Hall of the People in Beijing, where national leaders present plaques of awards to the best model workers selected from throughout the country.

In 1960 economic difficulties forced the government to give up expensive celebrations, such as the parade. During the early years of the Cultural Revolution (1966–1976), each May First became an occasion for Mao Zedong to inspect his Red Guards gathered in Tiananmen Square. The celebration usually culminated with a show of fireworks. In the late 1970s and 1980s, however, organized and spontaneous recreational activities were held, mostly in parks, to celebrate the Labor Festival.

In 1999 China created three week-long holidays, known as the Gold Weeks, to encourage tourism with the purpose of boosting the economy. They were the May First Labor Festival, National Day, and the Chinese New Year.
While significantly adding to the national coffers, these Gold Weeks also strained transportation, caused damage to the natural environment, and created painful inconveniences for the crowding tourists. On 16 December 2007, China’s State Council called off the Gold Weeks of May and October, restoring them to one-day holidays.

International Labor Day had its roots in America during the 1800s, when unsafe conditions and 10 to 16 hour workdays for factory workers lead to the formation of labor unions and factory strikes.
May Fourth Movement
Wǔ Sì Yùndòng 五四运动

The May Fourth Movement is the name given to the collective effort made by intellectuals in China between 1915 and 1923 to cast off traditional Confucian values and undergo a cultural rejuvenation. A milestone of the era occurred on 4 May 1919 when demonstrators protested the treaty that ended World War I. The treaty recognized Japan’s claims to territory taken from China.

China during the 1910s and early 1920s suffered the twin plagues of imperialism and warlordism. Military commanders had seized control of various sections of the country, leading to incessant fighting. Numerous foreign powers, taking advantage of this situation, carved out spheres of influence along China’s coast. Despite this unsettled environment, this time—known either as the “May Fourth era” or the “New Culture era”—was a vibrant time for Chinese intellectuals. People called for cultural rejuvenation and a more modern worldview, arguing that without such changes China could not liberate itself from the oppressive forces of imperialism or warlordism or both. Advocates of “new culture” from various groups criticized many of China’s philosophical, literary, and social traditions between 1915 and 1923.

Genesis of May Fourth Era
Many historians suggest that the May Fourth era began with the publication of the journal Xin qingnian (New Youth) in 1915. The first issue, edited by Chen Duxiu (1879–1942), called on its readers to be cosmopolitan, progressive, utilitarian, and scientific. Chen, in short, asked China’s youth to cast off the old elements of society and to bring about a national reawakening. A frequent target of the journal was Confucianism, the preferred symbol of Chinese traditionalism. Confucianism, with its emphasis on filial piety, hierarchy, ritualism, and orthodoxy, was condemned as antimodern and regressive. Xin qingnian within a few months became an influential publication among China’s student population.

Center of Liberalism
After Chen was made dean of the School of Letters at Peking (Beijing) University in 1917 the university quickly became the locus of what was to become the May Fourth Movement. University president Cai Yuanpei (1867–1940) was committed to making the university a center of intellectual liberalism and academic freedom. Peking University by the late 1910s was a hotbed of intellectual debate among students, faculty members, and independent writers.

Cai also brought Hu Shi (1891–1962), a young literature professor, to the university. Hu, educated in the United States, believed that literature was at the heart of China’s cultural problems. China’s classical written language, with its emphasis on specialized norms, obscure vocabulary, and terse diction, was inaccessible to all but the most educated people. Hu suggested that the solution was to write in the vernacular, allowing people with
a more rudimentary education to participate in China’s world of letters. Hu argued in the pages of Xin qingnian that writers should discard stale literary phrases, avoid classical allusions, and stop imitating the ancients. Hu suggested that writers instead be true to their own feelings. Only then, he said, would they produce something with substance and meaning. This focus on vernacular literature (baihua) led to a greater democratization of China’s literary world.

Although Hu was a proponent of baihua, its greatest practitioner was Lu Xun (1881–1936), a frequent contributor to Xin qingnian. Lu Xun wrote short stories designed to jolt readers out of their cultural complacency. In “Kuanggren riji” (“Diary of a Madman”), one of his better-known stories from this period, the protagonist repeatedly sees the words “eat people” written in the margins of classical Confucian texts. The protagonist, convinced that he is living in a cannibalistic society, goes mad with suspicion. Lu Xun satirically demonstrated by the end of the story that the Confucian social order was based, figuratively if not literally, on cannibalism. Lu Xun, by shocking his readers with such imagery, hoped to awaken them to the need for cultural renewal.

Intellectuals of the era also called for democratization in the political arena. Chen argued in Xin qingnian that democracy and science formed the foundation of modern society. He claimed that many of China’s backward practices could be reformed or even eliminated with the assistance of Sai Xiansheng (Mr. Science) and De Xiansheng (Mr. Democracy). By 1919 these and other catchphrases circulated around Peking University and, by way of Xin qingnian, throughout China’s intellectual communities.

1919 Demonstrations

Although pinpointing the beginning of the May Fourth era is difficult, pinpointing its chronological focal point is less difficult. The term May Fourth Movement refers to the demonstrations of 4 May 1919. On that day angry students, educators, and urban workers gathered in Beijing’s Tiananmen Square to protest the Paris Peace Conference, which ended World War I. In August 1914 Japan had declared war on Germany and had occupied all German-held territories in China. Because China also had participated in the war against Germany, many people believed that China would regain control over the territories after the war. The Chinese delegates attending the conference, bolstered by their faith in self-determination as championed by U.S. president Woodrow Wilson, were confident that the European powers would recognize the validity of their claims. But Japan’s delegates instead unveiled treaties signed by France, Britain, and Italy recognizing Japan’s demands in China.

In China public reaction to news of the treaties was quick and powerful. Upset citizens from throughout the Beijing area, led by students of Peking University, congregated to denounce Japan’s aggressive and underhanded maneuvering and to demand that China’s representatives reject the resulting treaty. The demonstrators, who eventually numbered in the thousands, marched through the streets until government troops restored order. Although the demonstration on 4 May lasted only a few hours, historians consider this event important in the development of modern Chinese nationalism.

In spite of the demonstration in Beijing, the peace conference ended, and Japan retained control of the Chinese territory (although the Chinese delegates refused to sign the treaty). But the demonstration was far from insignificant. Similar demonstrations erupted throughout China in the days after 4 May. In addition, many intellectuals increased their demands for “national salvation” through cultural reform. The May Fourth demonstrations in many ways symbolized the concerns of the new culture advocates. As a result, the intellectual movement that swept through China between 1915 and 1923 is often referred to as the “May Fourth Movement.”

Aftermath and the Rise of Communism

The May Fourth Movement became increasingly ideological in the years after 1919. Advocates of socialism, anarchism, syndicalism (a revolutionary doctrine by which workers seize control of the economy and the government by direct means), and even pragmatism competed in the marketplace of ideas. During this time the Chinese Communist Party was formed in Shanghai in the summer of 1921. The party endorsed the antiestablishment ideals of the May Fourth Movement. Since then official Communist histories have depicted the May Fourth era as an era...
of great patriotic fervor, the transition between an old, bourgeois democracy and a new, proletarian democracy. Not surprisingly, 4 May continues to be a national holiday, and May Fourth intellectuals such as Lu Xun are celebrated as patriotic heroes.

China’s intellectual debates had become more political and less cultural by the mid-1920s as the iconoclasm of the earlier years was replaced by new orthodoxies and as political organizations expected their members to toe the party line. For this reason, most historians feel that 1923 was the approximate end of the May Fourth era. Other historians, however, feel that the advocates of the movement continued to be active well after 1923. Regardless, the May Fourth Movement, with its emphasis on science, democracy, and antitraditionalism, has cast a long shadow over modern Chinese history.

Women and the May Fourth Movement

Many years after the May Fourth Movement of 1915–1923, Deng Yingchao recounted her experiences as a young woman and student at Tianjin Women’s Normal College during that unstable time in Chinese history.

What we did know intuitively was that alone we students did not have enough strength to save China from foreign powers. To awaken our compatriots we organized many speakers’ committees to spread propaganda among the people. I became the head of the speakers’ group in the Tianjin Women’s Patriotic Society and in the Tianjin Student Union. Frequently we gave speeches off campus. At first, we women did not dare give speeches on the street due to the feudal attitudes that then existed in China. So the female students went instead to places where people had gathered for an exhibition or a show, while the male students gave speeches in the street to passersby. There were always a lot of listeners. We told them why we should be united to save our country; that traitors in the government must be punished; and that people should have the right to freedom of assembly and association. We talked about the suffering of the Korean people after their country was conquered; and we publicly lodged our protests against the Northern warlord government that persecutes progressive students. Usually tears streamed down our cheeks when we gave our speeches and our listeners were often visibly moved.

Traditional Chinese medicine focuses on the body as a whole, and involves six main principles: the theory of yin–yang, the five elements, viscera, qi (life force), blood and body fluids, and the theory of the channels and collaterals. The principles of traditional Chinese medicine, though often intertwined with Western medicine, are still taught and practiced throughout China today.

The practice of medicine has a long unbroken history in China. Texts on traditional Chinese medicine (TCM) more than two thousand years old are still consulted by practitioners today. The most important ancient medical treatise is *Huangdi Nei Jing* (Yellow Emperor’s Canon of Medicine), also called the *Canon of Acupuncture*. It represents a monumental break from previous magical or supernatural healing systems in the East, much the same way the works of Hippocrates do in the West. This classic is the foundation for traditional Chinese medicine and continues to help the world’s largest health care system, which serves nearly 25 percent of the world’s population.

**Yin–Yang**

The concept of yin–yang rose from Confucian and Daoist philosophies. Yin–yang describes how opposing forces—such as motion/stillness, hot/cold, dark/light, male/female—are intertwined, interdependent, opposite yet equal. Yin–yang represents all the opposite principles in the universe. Each of these opposites produces the other. One cannot exist without the other. The doctrine of yin–yang influences every aspect of TCM’s theoretical system. It helps to explain the anatomy, physiology, and pathology of the human body. Yin–yang theory directs clinical diagnosis and treatment.

The common treatment with medicinal herbs is based on yin–yang theory. The properties, tastes, and functions of medicinal herbs are carefully considered before being mixed. This is one reason why yin–yang theory is still taught in the colleges of traditional medicine. Without an understanding of yin–yang theory, practitioners cannot learn how to use Chinese medicinal herbs for proper treatment.

**Basic Principles of TCM**

The basic principles of TCM are the theory of yin–yang, the five elements, viscera, qi (life force), blood and body fluids, and the theory of the channels and collaterals.
THE FIVE ELEMENTS

More than 2,000 years ago the Chinese Naturalist School identified wood, fire, earth, metal, and water as five dynamic processes—not five types of inactive matter—that were basic to understanding the natural world. Later they developed principles of mutual creation, mutual closeness, and mutual destruction to explain relationships in the natural world. In addition to representing the natural world, the theory of the five elements provides guidance for physiology, pathology, diagnosis, and treatment in TCM. All the tissues and organs of the human body, as well as the emotions, can be classified according to the theory of the five elements. For example, the liver and gallbladder are associated with wood; the heart and small intestines, with fire; the spleen and stomach, with earth; the lungs and large intestines, with metal; and the kidneys and bladder, with water. When applied to medicine, the theory of five elements stresses the interrelationships among the internal organs, not their individual functioning.

THE VISCERA AND BOWELS

In TCM the internal organs of the human body are divided into three groups: the viscera, the extraordinary organs, and the bowels. The five viscera are the heart, liver, spleen, lungs, and kidneys. These yin organs preserve the body’s vital substances. The extraordinary organs are the brain, bones and bone marrow, blood vessels, uterus, and gallbladder, which is both an extraordinary organ and a bowel. The extraordinary organs are also called bowels, but their functions are different from those of the six bowels. The six bowels, which are yang organs, are the gallbladder, stomach, large intestine, small intestine, bladder, and the triple warmer (sanjiao). They work together to move and process food and water.

Triple warmer (also called triple heater or triple burner) appears only in TCM. It is a term for the concept of an organ that transfers energy. It also is involved with metabolism. The triple warmer is conceptualized as a large bowel containing all the internal organs. It is used to anatomically locate the body parts. The triple warmer has three parts. The upper warmer is the section of the body cavity above the diaphragm that contains the heart and lungs. The middle warmer is the section between the diaphragm and the navel that houses the spleen and stomach. The lower warmer is the section below the navel that houses the liver, kidneys, bladder, intestines, and uterus. The triple warmer controls the flow of qi through the body.

QI, BLOOD, AND BODY FLUIDS

TCM holds that qi, blood, and body fluids are the basic components of the body and help to maintain the body’s normal functions. Qi is especially important because it supplies the vital energy needed by all the organs and tissues of the body. Qi refers both to the vital substance, or life force, of the body and to the physiological functions

A medical worker at a neighborhood clinic applies acupuncture to the leg of a local resident. PHOTO BY JOAN LEBOLD COHEN.
of the viscera, bowels, and channels and collaterals. In accordance with yin–yang theory, qi is yang and blood is yin; blood is the physical representation of qi.

**CHANNELS AND COLLATERALS**

Qi flows through the channels (jing), the main pathways running lengthwise through the body. Collaterals (luo) are branches of a channel in the system. The channels and collaterals circulate throughout the entire body, link with each other, and connect all the sections of the body to create an organic whole.

**Development of TCM**

The legendary ruler Shen Nung, who lived some 5,000 years ago, is considered the father of agriculture and herbal therapy. Huangdi, the mythical Yellow Emperor, born in 2704 BCE, according to legend, is considered the creator of ritual and of medicine and the compiler of the Nei Jing (Canon of Medicine). During the Warring States period (475–221 BCE), doctors (yi) formed the first medical organization independent of priests and magicians (wu). This organization’s first known representative was said to have been Bian Que (430–350 BCE, but thought by some to be legendary), who used the pulse rate as a basis for diagnosis and prognosis. He has been credited with writing the Nanjing (The Classic of Difficulties).

Zhang Zhongjing (b. 158 BCE, in Nanyang, Henan Province), the Chinese Hippocrates, systematized the study of symptoms and the treatment of disease using drugs. Zhang’s masterwork is titled Shanghan Lun (Treatise on Fevers), the oldest clinical textbook in the world. While the Canon of Medicine listed only twelve prescriptions and five forms of drugs (pills, powders, pellets, tinctures, and teas), Zhang’s work listed 370 prescriptions and a greater number of drug forms, including emulsions. His prescriptions for treating dysentery, encephalitis B, pneumonia, and hepatitis are still appropriate today.

Hua Tuo (d. 208 CE) was the preeminent surgeon of the Three Kingdoms period (220–265 CE). He contributed to the use of anesthetics, surgery involving opening the stomach area, and the practice of hydrotherapy. The Daoist alchemist and pathologist Ge Hong (284–364 CE) wrote a comprehensive medical handbook that covered such diverse ailments as infectious and parasitic diseases and neurological disorders. The first known monograph on surgery was a collection of procedures by Gong Qingxuan (d. 208 CE). Early surgery focused on the treatment of boils and ulcers, ailments of the upper classes.

The first state-sponsored medical schools in China opened in around 443. In 581, during the Sui dynasty (581–618 CE), the government opened the Imperial Medical Academy. Officials of the Tang dynasty (618–907 CE) expanded the academy in 624.

More medical classics appeared during the late Sui and early Tang eras. In 610 Chao Yuanfang and others compiled the medical classic Zhou Bing Yuan Ho Lun (General

Treatise on the Causes and Symptom of Diseases), the earliest surviving work in China on the origins of diseases. Its fifty volumes are divided into seventy-six classifications listing some seventeen hundred disorders. Included in the book are details on pathology, descriptions of symptoms of many known diseases, and essays on internal medicine, surgery, gynecology, and pediatrics.

Sun Simiao (581–682), one of the giants of traditional Chinese medicine, wrote two books that updated earlier medical knowledge: Ji Bei Qian Jing Tao Fang (Prescriptions Worth a Thousand Gold Pieces for Emergencies) and Qian Jing Yao Fang (A Supplement to the Essential Prescriptions Worth a Thousand Gold Pieces). Sun believed in diet over drugs. His books deal with diet therapy, preventative

care, health preservation, acupuncture, and moxibustion (the burning of herbal leaves near the skin).

During the Song dynasty (960–1279), the Imperial Medical Bureau was established and the education of doctors in the principles of TCM became more important. Students were offered such courses as Plain Questions Classic on Medical Problems and Treatise on Febrile Diseases. In 1026 Instructor Wang Weiyi designed two life-sized bronze figures to use in his teaching of acupuncture and moxibustion. When used for testing, the figures were filled with water and coated with beeswax. When a student punctured the correct acupuncture point, water would issue from it.

Four famous medical schools opened during the Jurchen Jin dynasty (1125–1234) and the Yuan dynasty (1279–1368). Each school specialized in the diagnosis and treatment of certain diseases. They were the School of Cold and Cool, represented by Liu Wansu (1120–1200); the School of Attacking or Purging, headed by Zhang Congzheng (1156–1228); the School of Injuries of the Spleen and Stomach, headed by Li Dongyuan (1180–1251); and the school of Nourishing the Earth, founded by Zhu Zhenheng (1281–1358).

The 

*Bencao gangmu* (*Compendium of Materia Medica*) of Li Shizhen (1518–1593) appeared during the Ming dynasty (1368–1644). It is perhaps the last great medical work written in China not influenced by Western scientific thought. *Compendium of Materia Medica* listed 1,892 medicines and more than 10,000 prescriptions. In addition to medical information, the work contained chapters on natural history, including a classification of mineral, vegetable, and animal products; chemical and industrial technology; geography; history; diet and nutrition; and other information. Li spent twenty-seven years compiling his encyclopedia. It is considered a major contribution to the development of pharmacology both in China and throughout the world and has been translated into all the languages of East Asia and the principal languages of the West.

Chinese doctors continued to correct ancient texts and develop new theories and procedures up through the Qing dynasty (1644–1912). Wang Qinren (1768–1831) wrote *Corrections on the Errors of Medical Works*. Wang corrected the errors in autopsy procedures in ancient medical books, reemphasized the value of autopsy, and developed the theory that pooling or stagnation of blood would result in pain and disease.

To put these developments into a Western historical context, William Harvey published his seminal work on the circulation of blood in 1682. His work built upon the work of other earlier European scientists who had read the Arab studies of al-Nafis (1228). Metabolism, hormone disorders and therapy, and circadian rhythms were discussed in second-century BCE Chinese texts, 2,200 years before their acceptance in the West. Chinese doctors were ahead of their European counterparts by nearly a thousand years in attempting to identify and control diabetes (although they never connected the disease with the pancreas). Studies of the body’s immune system developed in China in the tenth century CE, which led to a vaccine to prevent smallpox, among other advances. European doctors did not develop a smallpox vaccine until the eighteenth century.

Around 1911 or 1912, in the early years of Republican China, the emphasis officially switched to Western medicine. President Sun Yat-sen (1866–1925) was a Western-trained physician who steered his country toward Western medicine. Nevertheless, most Chinese people continued to go to TCM practitioners.

The status of TCM was officially reinstated following the establishment of the People’s Republic of China in 1949. By the 1950s experienced TCM practitioners were again producing texts with government support. By the time of the Cultural Revolution (1966–1976), the official emphasis in general health care had shifted back to TCM from Western medicine. By then the body of written knowledge was sufficient to train the so-called barefoot doctors and provide them with a manual describing traditional treatments.

**Contemporary Development of TCM**

Since the early years of the twentieth century, with the popularization of Western medicine in China, Western medicine and traditional Chinese medicine have developed side by side. Chinese medical professionals have realized that TCM and Western medicine each has its own advantages. In the Chinese way of adapting ideas from outside to serve Chinese needs, efforts have been made to combine the knowledge and practices of the two schools. Much of this effort has come since the end of
the Cultural Revolution, when many Western-trained medical specialists returned from labor in the countryside and were assigned to TCM institutions. They have been conducting basic and clinical research, using modern rigorous methods, to determine the effectiveness of TCM treatments.

Traditional Chinese medicine is now widely practiced in China. New technologies, such as laser technology, are used to augment 2,000-year-old methods. The State Council has created the State Administration of Traditional Chinese Medicine of People's Republic of China, which is responsible for the regulation of the TCM industry. There is now an estimated 340,000 TCM practitioners; 1,500 TCM hospitals with some 100,000 beds; and 26 colleges and 30 academies of TCM in China.

MEI Lanfang

Méi Lánfāng 梅兰芳

1894–1961 Theatrical performer

Mei Lanfang was a famous theatrical performer who, like many male actors of his period, played women’s roles. He introduced Beijing (Peking) Opera to foreign audiences when he toured Japan, the United States, and the Soviet Union.

Mei Lanfang was a theatrical performer born in Taizhou, Jiangsu Province, who achieved international recognition for his portrayals of women during an era in which women’s roles were traditionally assigned to men. Born to a family of noted opera singers, Mei began studying at the Beijing (Peking) Opera when he was eight years old, making his stage debut at twelve. At the age of fourteen he joined the Xiliancheng Opera Company and gained a national reputation after a series of performances in Shanghai and elsewhere in China. Mei introduced Beijing Opera to foreign audiences when he toured Japan in 1919 and 1924, the United States in 1930, and the Soviet Union in 1932 and 1935. In 1937 he ceased performing and moved to Hong Kong after the outbreak of the War of Resistance against Japan (1937–1945) in protest of the Japanese invasion. He later returned to China and performed in films and on stage from 1946 until his death. He played more than one hundred characters, one of the most famous being the Flower-Shattering Diva. His distinctive style of dance became known as the “Mei Lanfang school.” A charismatic and modest person, he is remembered as one of the greatest performers in Chinese history.

The philosopher Mencius was a follower of Confucius who advocated benevolent government based on the natural moral goodness of people. East Asian culture was greatly influenced by the teachings of Confucius and Mencius.

Mencius (385–303/302 BCE) was a third-generation follower of the Chinese philosopher Confucius (551–479 BCE). He wanted to reform his era by advocating a system of benevolent government based on the natural moral goodness of humans.

The influence of Mencius in defining ancient Confucianism is second only to that of Confucius himself. Sima Qian’s Records of the Historian (Shiji) of the second century BCE tells us that Meng Ke (Mencius) was from the state of Zou, which neighbored the state of Lu. He studied with a disciple of Confucius’s grandson, Zisi (492–431 BCE). Like Confucius, Mencius traveled to various states looking for a worthy ruler. He held a minor post without any authority as guest minister or teacher under King Xuan of Qi (319–301 BCE). Unable to influence the political climate, he retired with Wan Zhang (flourished fourth century BCE) and other disciples to write the book of philosophy known as the Mencius.

Book of Mencius

The Book of Mencius is one of the Four Books of Confucianism. After the Tang dynasty (618–907 CE), the Mencius eclipsed the Xunzi. Unlike the Analects (Lunyu) of Confucius, the Mencius contains developed prose essays and detailed arguments. In keeping with most ancient Chinese texts, the Mencius employs arguments based on an appeal to the authority of the sage rulers of antiquity. It also makes regular use of argument by analogy.

Mencius believed that a person’s moral integrity is a matter of the heart-mind (xin). The emphasis on the inner quality of a person’s moral life marked a change from Confucius, who clearly delineated the inner from the outer. Person-to-person care or humanity (ren) remained the core value, the innermost quality of the heart-mind, and first among the four cardinal virtues. For Confucius, ren meant everything noble in the well-bred person, disinterested concern for others, and other subtle qualities. For Mencius, ren meant simply benevolence. According to Mencius, the other virtues such as rightness (yi), ritual action (li), and moral wisdom (zhi) are also qualities of the heart-mind. In contrast to Confucius’s general and vague teachings, Mencius’s design for humane rulership is practical and effective. Mencius advocated abating punishments, reducing taxes, improving crop yields, and ensuring that the people are trained in moral cultivation. Although his political agenda was more practical than Confucius’s, Mencius continued to advocate Confucius’s idea that the ruler has to be virtuous to properly order society and to maintain the throne. When the ruler sets the moral example and the common people follow that example, then there will be fewer crimes and less need for punishment. Mencius accepted the ancient teaching that heaven’s decree or mandate (tianming) sanctioned the ruler’s position on the throne. Hence, the moral cultivation
and development of the ruler were of the utmost importance. Mencius expanded the concept of the Mandate of Heaven, which had been traditionally limited to natural disasters, to include peasant rebellion as a sign that the ruler had lost the mandate to rule. Sanctioning peasant rebellion as a reason to call for a ruler’s downfall naturally affected subsequent history. For Mencius the most important aspect of the state is the common people. The people take priority over the national symbols, the altars to the gods of grain and soil, and the ruler. The ideal for Mencius is a kind and moral government.

Human Nature

Mencius explicated the notion that human character is basically good, an idea that is only implied in the Analects. One of the theories of human nature popular during Mencius’s time was the view that human nature is nothing more than the biological drives and desires. In a debate with Mencius, Gaozi argued that human nature is the desire for food and sex. Mencius argued that people are basically or originally morally good. In this manner he could justify linking the Mandate of Heaven and rebellion. The natural world has built-in moral values, such as the Mandate of Heaven, and humans as part of the natural world also have innate or natural moral values. If naturally good peasants are forced to rebel, then there must be something wrong with the ruler’s virtue. The moral values are part of the human heart-mind, which is sometimes referred to as the “original heart-mind” or the “true heart-mind.” The moral values emanate from the heart-mind. The heart-mind of compassion is the starting point of benevolence (ren). The heart-mind of shame gives a person a sense of duty (yi). The heart-mind of courtesy and modesty inspires ritual observances (li). The heart-mind of right and wrong is the beginning of moral wisdom (zhi).

Mencius was rediscovered in the Song dynasty (960–1279) by the neo-Confucians, especially Zhu Xi (1130–1200). Zhu Xi codified the Book of Mencius as one of the Four Books, which served as a major part of the curriculum for the civil service examinations. As neo-Confucianism spread across East Asia, the Koreans and Japanese were reintroduced to Mencius’s teachings. Emphasis on the inner quality of the heart-mind, the four cardinal virtues, use of education to develop a person’s inner nature, and the practice of humane government are characteristics of Chinese, Korean, and Japanese neo-Confucianism that were originally derived from the ideas of Mencius. It is not an exaggeration to say that East Asian culture was shaped by the Kong-Meng (Confucius and Mencius) teachings.

Further Reading

Mencius on Human Nature

Mencius, a very influential third-generation follower of Confucius, believed in the natural moral goodness of humanity. From “On Human Nature”:

Everyone has a heart that is sensitive to the sufferings of others. The great kings of the past had this sort of sensitive heart and thus adopted compassionate policies. Bringing order to the realm is as easy as moving an object in your palm when you have a sensitive heart and put into practice compassionate policies. Let me give an example of what I mean when I say that everyone has a heart that is sensitive to the sufferings of others. Anyone today who suddenly saw a baby about to fall into a well would feel alarmed and concerned. It would not be because he wanted to improve his relations with the child’s parents, nor because he wanted a good reputation among his friends and neighbors, nor because he disliked hearing the child cry. From this it follows that anyone who lacks feelings of commiseration, shame, and courtesy or a sense of right and wrong is not a human being. From the feeling of commiseration benevolence grows; from the feeling of shame righteousness grows; from the feeling of courtesy ritual grows; from a sense of right and wrong wisdom grows.

Mi Fu, nicknamed “Madman Mi” lived an extraordinary life in his time. The Song artist and critic left behind great calligraphy pieces, poetry and books on painting. Mi’s artistic works carry heavy impact on Chinese art even today.

Mi Fu (also known as “Mi Yuanzhang”) was born in Zhenjiang, Jiangsu Province, during the Northern Song dynasty (960–1126 CE). Mi’s ancestors were the Hu minorities from Turkish tribes in northern China, from where they migrated to Xiangyang, Hebei Province, about five generations before Mi Fu was born. Mi had a strong tie with the imperial family because his mother served as the wet nurse to Madam Cao, the wife of the future Emperor Yingzong (reigned 1063–1067). Mi grew up in the palace compounds and began his career as the reviser of records of books and professor of painting and calligraphy. Later he served as secretary to the Board of Rites and then as military governor of Huaizhang. However, Mi’s real passion was in poetry, painting, calligraphy, artistic criticism, and connoisseurship. Mi, along with Huang Tingjian (1045–1105 CE), Su Shi (1036–1101), and Cai Xiang (1012–1067), was known as one of “the four great calligraphers of the Song dynasty.”

Mi was eccentric and peculiar in his behavior and appearance. Wherever he went, his outlandish clothing would attract a crowd. Legend tells that Mi always had water with him in order to clean his hands, especially when he was about to handle his art works, which he allowed no one to touch. He was seen bowing to a stone and addressing it as his brother because it was a collector’s item. In his time he was known as “Madman Mi.”

A sample of the calligraphy of Mi Fu (1051–1107), an artist, art critic, and calligrapher of the Northern Song dynasty.
As a painter, Mi was especially adept in nature scenery. Critics credited Mi as being the first Chinese artist who made use of dots (Mi dian) with lots of moisture on the brush tip to depict misty rivers and hills. Mi used brushes, paper sticks, dried sugarcane, and the calyx of a lotus plant to paint. *Spring Mountain and Pine Trees* and *Tower of the Rising Clouds* are two of his extant works.

However, Mi Fu is best known in Chinese history as a master calligrapher whose works exhibit creativity, freedom of expression, and a sense of spontaneity. After imitating past masters such as Wang Xizhi (303–379 CE), Wang Xianzhi (344–388 CE), Yan Zhenqing (709–785 CE), and Chu Suiliang (596–658 CE), Mi found that he was being confined within the rules and theories of old masters rather than expressing his own feelings. In his critical essays Mi wrote that to follow one's nature and sentiments at the time of composition is more important than to imitate the prescribed strokes of old masters. To Mi, art was about creativity and the expression of sentiments, not about styles or prestige. In terms of technique, Mi was also the first calligrapher who experimented with various brushstrokes using the front tip, side tip, and central tip, which allowed him to create more forms and styles. “Three Letters,” dated 1093, and “Poems Written at Huangzhou on the Cold Food Festival,” dated 1082, are examples of his fine calligraphy. His style is sometimes referred to as the kuangcao or mad cursive.

As a critic, Mi wrote books and essays, such as *Shu Shi* (History of Calligraphy), *Hua Shi* (History of Painting), and *Haiyue Mingyan* (Famous Words of Haiyue). He saw spontaneity and sentiments as integral components of art. Mi died at the age of fifty-six, survived by two sons and eight daughters. Only Mi Youren continued his father’s artistic legacy. About a dozen of Mi Fu’s original works are available today in museums in China, United States, and Europe.

As one of the fifty-five officially recognized ethnic minority groups in China, the Miao have a long and rich history. They have demonstrated the highest level of ethnic adherence and tenacity despite migration and adaptation to new environments. In recent decades, because of wars and economic necessity, the Miao have established themselves in communities around the world.

The Miao, an ethnic group that originated in China, is the fifth-largest ethnic group in the country, numbering 8.94 million in 2000 (according to the Fifth National Census). (The Hmong, a branch of the Miao, make up about a third of the Miao population—there is no name for them in Chinese, however—and many Hmong as well have migrated to Southeast Asia and abroad.) The Miao inhabit the southern provinces of Guizhou, Hunan, Yunnan, Sichuan, Guangdong, and Hubei, as well as the Guangxi Zhuang Autonomous Region.

Miao Groups
During their long history, the Miao have acquired distinct visible ethnic traditions, such as the color of design of their women’s costumes, to differentiate one subgroup of the Miao from another. Miao in western Hunan are called Red Miao; those in southeastern Guizhou, Black Miao; and those in northwestern Guizhou and northeastern Yunnan, Big Flowery Miao. Other well-known group names include White Miao, Green Miao, Blue Miao, and Small Flowery Miao. As a result of the Ethnic Identification Project of the 1950s, all the subgroups living in different areas of China were given the unified name Miao and designated one of the fifty-five officially recognized ethnic groups in mainland China (fifty-six including the majority Han).

Through most of China’s history, all ethnic minorities were regarded as barbarians by Chinese speakers. The term *Miao* was often used with *man*, a generic term for “southern barbarians.” In some southern Chinese subdialects, *miao* was used as an adjective to describe a person as fierce or stubborn. The name Miao in itself is by no means derogatory in China. In Chinese the word means “young plant” or “offspring.” It has long existed as the name of an ethnic group and as a surname among the Han, the dominant ethnic group of China.

Miao Language and Writing
The Miao language belongs to the Miao-Yao subfamily of the Sino-Tibetan language family. Because of a long history of migration and scattered settlements in isolated mountain regions, the language has developed into scores of dialects, many of them mutually unintelligible. Based on their linguistic characteristics, locations, and extent of intelligibility, these dialects have been identified in three dialect areas: the Western Hunan (or Eastern), Eastern Guizhou (or Central), and Sichuan–Guizhou–Yunnan (or Western).
The Miao language was once only a spoken language. Linguists, working with native speakers, created a writing system in 1956. Four of the Miao dialects now use a romanized alphabetic writing system.

**Miao Culture**

The Miao have an extremely rich oral tradition, complete with mythologies, legends, histories, poems, dramas, operas, and songs. In Chinese historical literature, the recorded history of the Miao is as long as that of any other group in China. Chinese records contain information on Miao ethnic origin, migration, customs, social structure, economic activities, technical achievements, and relations with other ethnic groups and the state. Throughout their history, the Miao have demonstrated the highest level of ethnic adherence and tenacity.

The Miao follow a patrilineal descent system (descent through the father’s line) and a patronymic linkage...
system (a practice in which part of the son’s personal name comes from that of his father). Most young people are free to marry whom they please, but arranged marriage is also practiced in some areas. In western Hunan and Guizhou, cross-cousin marriage is practiced. This practice requires that one should marry one’s cross-cousin—mother’s brother’s child or father’s sister’s child—if such a person is available. Levirate, the custom whereby a man marries the widow of his deceased brother, is also practiced in many areas. Sororate, the custom whereby, when a man’s wife dies or is unable to bear children, her unmarried sister is given to him as a wife, is sometimes practiced among the Miao in Yunnan. Delayed-transfer marriage, the custom in which the bride does not live with her husband until two or three years after the wedding day, is a common practice among the Miao in Guizhou. Beyond the household grouping, relations are organized into lineages, subclans, and clans. One’s position in the kinship network and role in the ritual system of ancestral worship are important ways of defining the social status of a Miao person.

In addition to ancestral worship, the Miao practice animism (endowing inanimate objects and natural forces with life) and a type of shamanism. Christianity has been practiced by some Miao in Guizhou, Yunnan, and Sichuan since the nineteenth century.

Agriculture has long been the traditional means of subsistence for the Miao, supplemented at times with fishing, hunting, and handcrafting; dyed batik cloth, a tourist favorite, has been produced by the Miao for over one thousand years. As in other regions of China and with other ethnic groups in recent decades, education has been developing rapidly in the Miao areas. Inside and outside of China, the Miao have their own teachers, lawyers, medical doctors, scientists, and engineers.

A Chinese holiday celebrated during the autumn season, Zhong Qiu celebrates family togetherness, which is symbolized by the roundness of the completely full moon. Though the true origin of this festival is unknown, and many of the traditions associated with it are derived from a range of tribes and countries, it is considered one of the most important festivals for the Chinese.

Zhong Qiu, also known as the “Mid-Autumn Festival” and the “Moon Festival,” is held on the fifteenth day of the eighth month of the lunar calendar and is the third-most important family reunion day for Chinese throughout the world (after the lunar Chinese New Year, which falls between late January and late February, and the tomb-sweeping Qing Ming Festival on 5 April). On the day of the Mid-Autumn Festival family members gather for the evening meal and afterward move outdoors to enjoy the full moon. The perfectly round and bright moon (yueyuan) signifies the complete togetherness (tuanyuan) of the family. Those who are away from their families during the festival feel sad for missing such an opportunity.

Two foods, the moon cake and the pomelo, are closely associated with the festival. The moon cake is baked with a flour-based shell surrounding a sweet bean-paste stuffing. A pomelo (or pummelo, *Citrus maxima*, *Citrus grandis*) is a citrus fruit that ripens in southern China around mid-autumn. Both foods are round, like the moon, and further strengthen the importance of family unification.

No consensus exists among sinologists as to when or where the Moon Festival originated. The scholar Wolfram Eberhard believed that it began rather late in Chinese history, perhaps in the post-Han dynasty (206 BCE – 220 CE) era, and had one of two possible origins. The first was with the Yao tribe, who once had wide distribution in China’s southern provinces of Fujian, Hunan, and Guangdong.
The Yao people follow a lunar calendar, and the fifteenth day of the eighth month is actually the beginning of their New Year, which they celebrate by worshipping the Moon Goddess at night. The second possibility is that the festival originated in north China and Korea, where peasants harvested their crops of millet or sorghum by mid- to late September. (It should be noted as well that eating moon cake to celebrate the full moon was a practice of the Thai, another minority group that was once widespread in southwest China’s Yunnan, Guizhou, and Guangxi provinces.) Whatever the origin, the homogenizing process of unifying and standardizing local customs throughout Chinese dynastic history gradually blended these elements to become one major festival.

Folklore holds that Emperor Zhu Yuanzhang, founder of the Ming dynasty (1368–1644), originated the now-abandoned practice of inserting a piece of paper inscribed with secret messages into a moon cake. According to legend, Zhu sent secret messages to encourage the Han Chinese to revolt against the occupying Mongols on the fifteenth day of the eighth month and succeeded in bringing down the Yuan dynasty (1279–1368).

**Mid-Autumn Moon Cake**

These dense cakes are sold in elaborate packaging across Asia in the autumn and often contain salted boiled eggs inside the sweet paste filling. This recipe is just a basic version; many variations can be found in cookbooks and online.

**Makes 2 dozen**

**Filling**
1 can (17½ ounces) lotus seed paste  
½ cup finely chopped walnuts

**Dough**
4 cups all-purpose flour  
½ teaspoon salt  
½-cup non-fat dried milk powder  
1 cup sugar  
3 eggs  
3 teaspoons baking powder  
½ cup solid shortening, melted and cooled

1 Mix lotus seed paste and walnuts together in a bowl; set aside.

2 Sift flour, milk powder, baking powder, and salt together into a bowl. In large bowl of electric mixer, beat eggs until uniform. Add sugar; beat for 10 minutes or until mixture falls in a thick ribbon. Add melted shortening; mix, and fold in flour mixture. Turn dough out on a lightly floured board; until smooth and satiny. Divide dough into 24 equal pieces.

3 To shape each moon cake, roll a piece of dough into a ball. Roll into 4-inch circle about ⅛-inch thick. Place 1 tablespoon of lotus seed paste mixture in center of dough circle, and seal with the edges of the dough. Lightly flour inside of moon cake press with 2-1/2 inch diameter cups. Place moon cake, seam side up, in mold; flatten dough slightly. Remove from mold, and place on ungreased baking sheet. Brush tops with egg yolk.

4 Bake in a preheated 375 degree F. oven for 30 minutes or until golden brown. Let cool.

Migrant workers are individuals who move from one location to another for work; they are sometimes referred to as labor migrants. The migrant population in China is unique, with a two track migration system that includes both permanent and temporary migrants. Migrant workers are an important factor in China’s industrialization and rapid transformation into a global economic power.

Population mobility in China was slow prior to the 1980s but has accelerated since then due largely to economic opportunities in cities. The hukou (household registration) regulations, a hierarchical system based on a person’s urban or rural residency, have sustained a two-track migration system, comprising elite permanent migrants and poor, unskilled, and exploited temporary migrants from the countryside. The second-generation rural migrant workers are more ready to establish roots in cities, which are also increasingly attracting skilled workers from overseas.

Population Movements
Prior to the 1980s

Historically, population mobility in China has been low. This reflects partly the agrarian nature of the economy, which bound people to the land. During the first decade of the People’s Republic of China (PRC), mobility increased as rural Chinese flocked to the city to escape collectivization, crop failures, and poverty and to search for work and economic opportunities. During the 1950s, in order to maintain stability, the Chinese state ratified various regulations on urban residence, which culminated with the hukou (household registration) regulations of 1958. These regulations assigned to rural and urban Chinese different institutional statuses and means of survival. Urban Chinese were allocated food, jobs, and state-subsidized welfare—resources denied to rural Chinese, who instead were expected to rely on farming for their livelihood. This system severely limited rural people’s ability to survive in urban areas, and as a result, rural-urban migration declined sharply during the 1960s.

At the same time, the Chinese state’s development plans, driven in large measure by political and ideological considerations, resulted in forced population movements. The Third Front program (1965–1971) moved factories and industrial workers from the eastern coastal region, which was considered vulnerable to outside attack, inland to remote and mountainous areas. And, during the Cultural Revolution (1966–1976), the rustication movement sent millions of urban Chinese and cadres into the countryside to farm and work. In addition, Han Chinese were sent to minority regions such as Tibet and Xinjiang to consolidate Communist rule there.

Mobility in Post-Mao China

The economic reforms that began in 1978–79 paved the way for hukou reforms and relaxation of migration...
control, which in conjunction with marketization of food and other necessities have made it easier for rural Chinese to work in urban areas and have enabled overall mobility to rise. The Chinese censuses have documented that between the 1985 to 1990 and 1995 to 2000 periods, interprovincial migration flows surged from 11.5 million to 32.3 million, and intercounty migration flows increased from 35.3 million to 79.1 million. China’s intercounty migration rate of 7 percent for years 1995 to 2000 is still significantly lower than the United States’ 18-percent rate, but China is no longer an immobile society. Floating population, a stock measure of the total number of people not living at their place of hukou registration, increased from 22.6 million (2 percent of the population) in 1990 to 78.8 million (6 percent of the population) in 2000. When intracounty counts are included, then the floating population in 2000 was 144.4 million, or 12 percent of the nation’s population. Estimated to be 150 million in 2005, the floating population is projected to reach 200 million by 2015 and 250 million by 2025.

*Hukou* gave rise to a unique, two-track migration system in China. Permanent migrants are migrants who are registered at their destination; temporary migrants—the floating population—are those who are registered elsewhere. Permanent migrants comprise mainly employees sponsored by the state, educated and skilled workers, and students in higher-education institutes. The vast majority of temporary migrants are poorly educated, unskilled, rural people who seek work in urban areas but are denied *hukou* there. Between the 1985 to 1990 and 1995 to 2000 periods, the proportion of temporary migrants among all migrants rose from 46 percent to 74 percent, a clear indication that population movements in China are increasingly defined by market-driven, rural-urban labor migration. At the same time, state-planned migration continues to exist, especially due to massive construction projects such as the Three Gorges Dam and the Olympic facilities.

### Migrant Work as a Way of Life

Most rural-urban migrant workers in China are between their late teens and late twenties in age. Men constitute the majority of these migrants, but women’s representation has increased over time. Rural men and women, upon finishing elementary or junior secondary education, are motivated to find work in urban areas because in the countryside arable land is limited, the agricultural labor surplus is large, and farming and other rural activities are simply unable to lift them out of poverty. Many leave home for towns and cities in the same province, while others travel from poor, inland provinces such as Sichuan.
Hunan, and Anhui to coastal areas such as Beijing, Shanghai, and Guangdong’s Pearl River delta to work. Unlike the li tu bu li xiang (leaving the land but not the countryside) model, in which one does off-farm work but stays in the home village, with the li tu you li xiang model (leaving the land and the countryside), millions of Chinese leave their villages to work and return home infrequently, mostly during the Chinese New Year (or Spring Festival, usually in late January or early February). The winter snowstorms of 2008, however, prevented many people from returning home for the Spring Festival.

In the city, rural migrant workers tend to have “3D” jobs—jobs that are dirty, dangerous, and demanding—in such sectors as construction, domestic work, and manufacturing. Their labor is the key to China’s urbanization and industrialization, but they are exploited, discriminated against, and segregated from the rest of the urban society. While thriving migrant communities exist, such as the Zhejiang Village in Beijing, most rural migrant workers in cities lead a marginalized and vulnerable life.

Nonetheless, remittances from migrant work account for at least 20 percent and up to 40 percent of the annual income of the migrants’ households, funding large projects, such as house building or renovation and weddings, and improving the countryside’s standard of living. Throughout China’s countryside, migrant work has firmly established itself as a way of life and a necessary, desirable source of livelihood. The economic benefits of urban work are so attractive that rural migrants are willing to tolerate dividing their households, leaving behind their wives or the elderly to raise children and farm. A split-household arrangement has negative effects on spousal and parent-children relationships, but the high cost of housing, education, and health care in cities discourages migrants from bringing family with them. Circular migration, spending time working in the cities, returning home for some time, and then leaving for urban work again, can occur repeatedly.

China’s New Migrant Workers

The first generation of rural migrant workers—those who entered the workforce in the 1980s and 1990s—are now past their peak years for migrant work, and some have returned permanently to the countryside. Many rural youths, some having never engaged in agriculture, are repeating their parents’ path of circular migration. However, there is also evidence that young, rural Chinese as a whole are attaining higher levels of education, and more of them now hope to find permanent, more prestigious work in urban areas and leave the countryside for good.

China’s rapid economic growth has, at the same time, attracted migrant workers from outside. Many foreigners and overseas Chinese hold high-rank management and technical positions and constitute the so-called golden-collar elites in Chinese cities. High-end commercial housing, such as Taiwan Village in Shanghai, caters to these migrants. In addition, mainland Chinese students who have earned advanced degrees overseas are increasingly motivated to return, thanks to the rising demand for skilled, professional workers and the promise of more speedy social and economic mobility than they would find in non-Chinese, Western societies. At both ends of the socioeconomic spectrum, therefore, Chinese migrant workers are pursuing economic opportunities by moving to places where they hope to find not only jobs but also a niche.

The effects of the global financial crisis that began in 2008 are, no doubt, felt by China’s rural migrants. In February 2009, China’s Ministry of Agriculture reported that 20 million migrant workers recently lost their jobs, increasing the risk of social unrest. As one after another Chinese manufacturer goes out of business, migrant workers are the first to suffer. For a quarter of a century, rural migrants have provided the labor for China’s rapid industrialization and economic growth. Now, they must face the difficult dilemma between returning home to poverty and risking unemployment in the city.

Accurate Chinese migration statistics are notoriously hard to come by. United Nations researchers once called the Chinese floating population—the largest migrant group inside China—“statistically invisible.” While reforms to statistical reporting systems have begun to emerge, the concept of interregional migration in China remains difficult to record.

Any meaningful analysis of Chinese migration must begin with an understanding of the hukou (household registration) system and its relationship with migration. In China, migration was an area of heavy state control in the past and active state regulation exists at present. People wanting to change residence permanently are required to get approval from one or more authorities. A change in residence is deemed legal only when it is formally approved and registered with the public security authorities. For urban dwellers, changing residence within the same city or town (to move to a new apartment, for instance) and residential changes caused by marriage are generally permitted.

Similar freedom is also given to rural residents moving within their rural area because of marriage or other family reasons. But formal (permanent) moves crossing city, town, or township boundaries are heavily regulated and require the possession of a migration permit issued by the public security authorities. The permit is granted only sparingly when there are extraordinary reasons and when it is seen as serving (or at least is not at odds with) the central or local state interests defined in various policies, such as controlling the growth of large cities. Hence, to an ordinary person without state connections, getting a migration permit for moves from rural to urban areas or from smaller cities to larger cities is still very hard, if not totally impossible. The hukou system in the prereform era functioned as a de facto internal passport mechanism; today it still serves many similar functions, although peasants can now travel to many places to take up jobs or stay with relatives temporarily. The catch is that temporary migrants are ineligible for many of the benefits and rights of permanent local residents.

Massive rural labor outflows (workers in search of employment) have been the most important aspect of China’s geographic mobility in the last quarter century. “Rural migrant labor” is defined as a working population (from the countryside) that moves to a destination without a local hukou. (See table 1.) By inference, it is a subset of the “floating population.” Most rural migrant labor is unskilled labor; only a small percentage are skilled craftsmen and traders, and these are often self-employed. A portion is seasonal, operating in synchronization with farm work schedules (the outflow is larger in winter when there is not much work on the farm). Numerous large-scale national surveys of rural migrant labor have been conducted, especially since the early 1990s, when this group started to increase quite rapidly. Many surveys of this kind are one-time studies and are not strictly
comparable; the national rural migrant labor estimates are usually derived from the percentages generated from these sample surveys.

Migration Trends since the Early 1980s

Some general migration trends are identifiable in the past twenty-five years. Despite the general surge in migration, the annual volume of hukou migrants has remained quite stable, at between 17 and 20 million. The rate has actually declined slightly, relative to the size of the Chinese population. An analysis of the figures from the Ministry of Public Security from 1993 through 2005 shows that between 80 and 90 percent of all hukou migrants were recorded in urban areas. The stability reflects strong government intervention in this area.

On the other hand, the size of the non-hukou migrant population has clearly been rising since the early 1980s. The “floating population” started to grow rapidly in the mid-1980s to about 70 million in 1988, then dropped somewhat from 1989 to 1991 due to an economic austerity program; it then regained momentum around 1992 through probably 1997, reaching 100 million at that point. The current figure is about 150 million. Similarly, between 1992 and 2006, the number of rural migrant laborers has more than doubled, from 53 million to 115 million.

The trend among the “temporary population” subset of the non-hukou migrants is much less consistent: two data points, 2000 and 2005, are far larger than the other years’ figures. The 2000 and 2005 figures are more supposedly accurate than the figures in other years because they are from a full census (in the case of the 2000 figures) or a 1 percent sample (in the case of the 2005 figures), while the data in other years draw from a 1-per-1,000 sample. Earlier research suggests that the 2000 census figure is, however, likely to be overcounted; it is also likely that the 1-per-1,000 samples may have undercounted the migrant population. If this same logic can be applied to the figures in 2005 and 2006, then it is reasonable to believe that the temporary population, defined as such, was between 130 and 150 million from 2005 to 2006.

Another careful examination of the data will show that there was a slowing down of migration from 1996 to 1999. For example, the temporary population in those years only inched up slightly; the average growth rate of rural migrant laborers also dwindled to 4.8 percent per year in the years between 1995 and 1998, compared with 7.3 percent per year from 1992 to 1995. It is believed that this slowdown in rural outflow was related to the sluggish performance of the urban economy, job competition from laid-off workers of urban state-owned enterprises (SOEs), increasingly protectionist policies used by local governments against recruitment of outsiders, and improvement in the rural economy, at least between 1996 and 1999.

The Geography of Migration

Significant disparities in wages between the urban and rural sectors and among regions underlie a great portion of labor migratory flows in China. The bulk of migratory flows in the last twenty-five years involves predominantly those who are not changing their hukou location (non-hukou migration), mainly rural migrant labor. The root cause is lack of sufficient gainful employment in the countryside in many agricultural provinces. Because of serious institutional barriers—mainly the hukou system—the rural and urban population segments and the labor markets operate as two largely separate circuits or strata. The choice for rural migrant labor is mainly between a farm job (or no job) at home and a low-end job in a city. Rural migrant labor moves across different geographic regions to benefit financially, which can be broadly considered in terms of the balance of the wage differentials and living cost differentials between the origin and the destination. Most rural migrants go to nearby towns outside the villages, but others cross thousands of miles to big cities on the coast. Two major sources of available data of a different nature allow us to examine the national geographic patterns of migration in the 1990s and beyond.

Population Data: Migration Importers and Exporters

The first source is the population data derived from full censuses (1990 and 2000) and the 1 percent national population surveys in 1987, 1995, and 2005. In the data covering migration flow, “migrant” is defined as a resident (staying
more than six months or one year in an administrative unit) who lived in a different administrative unit five years earlier. Those data, plus data from the 1982 census, also provide information on the size of the non-hukou population (migrant stock), based on roughly similar but not exactly the same criteria. The 1995 survey reports a total of 33.23 million migrants crossing county-level boundaries in the preceding five-year period. Seventy-two percent of the intercounty migration was within provinces; the remaining 28 percent (9.2 million) was interprovincial migration (IPM).

From 1995 to 2000 the volume of migration increased substantially. With the caveat that the 2000 census probably overcounted migrants, it appears that intercounty migration doubled between 1995 and 2000. Using information from a 1 percent microdata, one can also classify and estimate the flows by origin and destination. The predominant flow was from rural to urban areas (50.32 million), followed by urban to urban flows (45.70 million).

Total IPM volume has increased significantly since 1990, from only 9.2 million between 1990 and 1995 to 38 million between 2000 and 2005. The different definitions and procedures used for collecting the data obviously account for a small part of the increase; the remaining increase can be assumed to be real. IPM also accounts for an increasingly greater share of all intercounty migration in the 1990s, for example, from only 28 percent between 1990 and 1995 to 44 percent between 1995 and 2000. It is very likely that the same is also true in the first half of the decade. The high concentration in the coastal provinces continued to be maintained between 2000 and 2005 (55 percent). In the 1990s there was also significant convergence into one single province (Guangdong), which received 34 percent of all IPM between 1995 and 2000, compared with only 20 percent in the earlier period. The pattern was slightly altered from 2000 to 2005 by Zhejiang’s rapid rise to become the second net importer of labor, with a net intake of 11 percent. Guangdong dropped slightly to 27 percent in this period.

On the net exporter side, Sichuan, the largest exporter province, was the single dominant net exporter between 1990 and 1995 with −14 percent, far exceeding the second-place net exporter (Anhui, whose net IPM was −7 percent). Sichuan’s dominance was slightly eroded between 1995 and 2000 (net IPM −12 percent), partly because of the split of Chongqing from the province. More importantly, the second-, third-, and fourth-largest net exporters (Hunan, Anhui, and Jiangxi) all had net IPM values much closer to those of Sichuan between 1995 and 2000 (−7.6 to −9.0 percent), and that trend continues between 2000 and 2005; the four largest net exporters have about the same net IPM values (−7.4 to −8.4 percent). In other words, in those fifteen years, while there was a convergence of the IPM flows into one or two provinces, sources became more diverse. These changes seem to be related to the intensification of the regional industrial restructuring beginning in the late 1980s, whereby inland provinces lost proportionally more manufacturing jobs to the coastal provinces in the second half of the 1990s, giving rise, in particular, to the emergence of Guangdong as the industrial leader, indeed the “world’s factory.” The pattern appears to be consistent with the diffusionist paradigm of migration in which migration has been adopted as a labor strategy by an increasing number of households in a greater number of provinces in the noncoastal provinces.

Certain provinces experienced some interesting ups and downs during these three periods. Most striking is Zhejiang. For a time, migrants from this province went almost everywhere in the country (and to many parts of Europe too). But the province has gone from being a major net exporter of migrants (the seventh-largest net exporter between 1990 and 1995) to a top net importer of
migrants (the third-largest between 1995 and 2000 and second between 2000 and 2005). This shift is related to the economic success and industrial job growth of the province. On the other hand, the position of Xinjiang Uygur Autonomous Region has slipped in the ranking in the years since 1990. Its net IPM percentage dropped from about 5 percent between 1990 and 1995 to only 1 percent between 2000 and 2005.

The fact that the poorest and relatively populous provinces like Guizhou are not among the lowest in migration rank shows that it is not simply abject poverty that drives long-distance migration. While most provinces are predominantly either importers or exporters, there are some notable exceptions, such as Jiangsu, Fujian, Shandong, Hubei, Hebei, and Zhejiang between 1990 and 1995; Jiangsu between 1995 and 2000, and Shandong and Hebei in both periods from 1995 to 2000 and 2000 and 2005. The fewer number of provinces in the more balanced in- and out-migration category is consistent with the greater regional economic specialization or polarization that took place in the 1990s. It is also interesting to note that Guangdong also registered a significant out-migration (1.7 million) in the latest period (2000–2005). A detailed examination of the 2005 data suggests that the out-migration was largely to the provinces from which in-migrants had originally come (such as Hunan and Jiangxi). The out-migration from Guangdong is likely a return migration rather than a diversion of migrant labor from Guangdong to other coastal provinces.

**Rural Labor Data and Surveys**

The second major set of migration data draws from national surveys of rural households done by the National Bureau of Statistics and rural migrant labor surveys undertaken by other agencies or research institutions. The data provide some direct and useful information about this special group. Because rural migrant labor, defined on the basis of migrants’ hukou status, is a rather unique Chinese phenomenon, some of the migration statistics compiled are less standard. The national estimates are all derived from large sample surveys that were conducted at different times, often using only broadly the same definition of rural migrant labor. As mentioned earlier, this kind of rural labor migration study covers only labor migration from the countryside, regardless of a migrant’s length of stay at the destination. Therefore, these surveys capture more comprehensively all labor migrants, in contrast to the census data, which exclude migrants staying in the destination less than six months or a year.

Available geographic data from three separate major national sample surveys undertaken in late 1993 (and early 1994), 1998, and 2004 are particularly useful. According to the 1993 study, the stock of rural migrant labor (those who participated in work outside their village, including seasonal labor) at the end of 1993 and early 1994 reached 51 million, accounting for about one-eighth (12.5 percent) of the country’s rural labor force. The flows were predominantly toward urban areas (77.9 percent). China’s central region was the largest source of rural migrant labor, having the highest labor out-migration rate (15.9 percent) and volume (22.8 million), followed by the western region (13.5 percent and 15.4 million). The eastern region had the lowest rate (8.5 percent) and the smallest volume. This pattern is broadly consistent with the findings of other studies of the early and mid-1990s. Because of the large size of the labor force in central provinces, this region accounted for 44 percent of the estimated total outflows. The low rate of out-migration in the eastern region is attributed to the high level of development of rural nonfarm enterprises in many villages and townships, which absorbed local and nearby rural labor. This is not the case for the central or western regions.

Nationally, a great portion of the movement was within counties (36 percent) and even more within migrants’ own provinces (71 percent) in 1994. A decade later, the overall labor out-migration rate almost doubled the rate in 1994 (from 12.5 to 23.8 percent). Among the three regions, the eastern region has gained a significant share of the migrant labor over time. Rural migrant labor was found almost entirely in cities and towns (94.3 percent), with a large percentage in large cities (62.4 percent).

A comparison of the 1993 data with another broadly similar national rural migrant labor survey from 1998 to 1999 reveals some interesting trends. Both of them report a stock of rural migrant labor of about 50 million. While the size and percentage of within-county migration remains quite stable (17–18 million, or 34–36 percent), there is a significant increase in the migration to other provinces, mostly to another region, between 1993 and 1998. This
means that rural migrants moved to farther destinations over time. This is consistent with what has been shown earlier based on 2000 census and 2005 mini-census data. Drastic increases in the number of migrants crossing both provincial and regional boundaries are obvious. In 1998, this group accounted for 31 percent of the migrant stock, whereas it accounted for only 18 percent in 1993.

Another regional comparison of the data in 1993 and 1998 in shows that the central region further consolidated its role as the largest source of rural migrant labor crossing provincial boundaries (55 percent in 1998 compared with 46 percent in 1993), and the eastern region is the destination of the vast majority of interprovincial rural migrant labor (increasing from 70 percent to 83 percent). Interprovincial rural migrant labor generated in and from the western region has witnessed the most rapid growth, with its share rising from about one-quarter to one-third in those five years. The share of out-of-province rural migrant labor in the eastern region, however, dwindled from about 30 percent to only about 11 percent of total interprovincial rural migrant labor in the same period.

Most of the interprovincial rural migrant labor in the eastern region stayed within the region (71–72 percent) throughout the 1990s. A large, and increasing, majority of the interprovincial rural migrant laborers from the central and western regions moved to the eastern region (87 percent from the central region and 79 percent from the western region). In terms of the regional outflow pattern, migrants from the western region followed the footsteps of migrants from the central region. Five years earlier, a large portion of out-of-province rural migrant labor (38 percent) from the western region moved within the same region. In the late 1990s, a much smaller percentage still did (14 percent), while almost three quarters of them moved to the eastern region. It has been argued that such moves placed migrants in the best position to benefit from the largest geographic wage disparities possible, and one would also expect that migration would narrow the spatial disparities.

Another comparison between 1998 and 2004 shows that the eastern region has further concentrated rural migrant labor, accounting for 70 percent of all migrants, as compared with only 38 percent in 1998. The two net exporting regions (central and western) show a similar trend; in terms of the destination distribution of all rural migrant labor, the central region still had a much higher percentage in the eastern region than the western region did (because the central region had a higher rate of out-of-province migration).

Guangdong and Sichuan, which are the two provinces with the largest net migration change (in-migration and out-migration, respectively) between 1995 and 2000, are also the provinces with the lowest and highest per capita GDP growth rates, respectively, in the same period. If we add the remittances migrants sent back to their hometowns to our calculus, the overall economic gains of migration to the sending provinces would be even greater. This postulate is consistent with the general pattern of higher rural income growth rates in locales associated with higher rates of out-migration (after controlling for other factors) in China.

Considering the Future

Although previous works have shown that China’s rising migration went hand-in-hand with an increase in regional disparities, one may argue that interregional migration actually helped to narrow spatial economic disparities. From a human capital perspective the Chinese government must continue to promote education and migration as a way to narrow the gaps between the coastal and inland provinces.

More importantly, migration is also closely tied to the reforms of the hukou system. Despite a good deal of official rhetoric about abolishing the hukou institution, the reality is quite different. Almost all the changes to the hukou system and new initiatives have had only marginal impact on weakening the foundation of the system—that is, the separation of two segments of population and discrimination based on that separation. The hukou system, directly and indirectly, continues to be a major barrier that prevents China’s rural population from settling in the city, maintaining the rural–urban “apartheid.” This problem has become more acute as rural migrant labor has become more and more permanent (rather than seasonal) with an increasing proportion of women and children. Increasingly, the problem migrants face is not just employment, but also education (for their children), health, and social security. Despite the good intentions of
the central government, local governments do not seem ready to implement any fundamental change to the hukou system.

Further Reading

China’s intentions in modernizing its military are largely unclear to the outside world, but many experts believe that China wants to build forces that are superior to those of its regional peers, that create the option for quick action against Taiwan if necessary, and that are ultimately capable of defeating U.S. forces in a regional conflict.

China’s military modernization must be placed in the context of changes in the nature of warfare. Three related developments shape the current military environment. The first is the development of a high-tech, information-intensive style of combat, pioneered by the United States in the first Persian Gulf war. The second is the reaction of the United States’ potential opponents—such as China—to the conventional military superiority that this style of combat has given the United States. The third is the development of new kinds of weapons and new modes of attack. The conventional strength that the United States’ high-tech, information-intensive style of combat gives it means that potential opponents are likely to seek asymmetric advantage: They will avoid conflict where the United States is strong and attack where it is weak, and they will rely on unconventional weapons and tactics to do this.

In this context, certain conclusions about military modernization can be made by observing the kinds of military capabilities that China is acquiring, the military doctrine it is developing, and the nature of the exercises and training its forces undertake. But care must be taken in making these deductions about intent because China’s modernization could reflect military ambitions, a desire for improved defense, a wish to demonstrate prestige and status, or a combination of all of these.

Although an asymmetric approach explains some of what China is doing in its military modernization efforts, it is not the full explanation. China appears to be deeply concerned with prestige, with gaining international recognition and reclaiming its place among the great nations of the world. China would also like to be recognized as the paramount power in the Asia-Pacific region. Some of its military activities and acquisitions are made in the interests of prestige and influence, and China’s rivals for supremacy in Asia include not only the United States but also China’s powerful neighbors—India, Russia, and Japan.

Modernization

A decade ago, in terms of the sophistication of its arsenal, China’s military lagged behind not only large regional powers such as India but also behind smaller countries such as Korea and Singapore. China’s determination to develop a high-tech economy has always had a military component: It has always desired to close the gap between its military and the militaries of its neighbors and other great powers.

The notion of catching up with or even leapfrogging over Western nations has also been a theme for many decades in Chinese policy. The notion that China will be able to make rapid technological advances that allows it to
surpass other nations remains attractive in China, despite its many failed leapfrogging efforts, and the concept of leapfrogging reinforces Chinese thinking about the need to gain asymmetric advantage.

In fact, China could pursue two modernization strategies simultaneously; a long term strategy to build advanced defense industrial capabilities and powerful conventional forces (including a blue-water navy with an aircraft carrier and advanced submarines) and a near term strategy of acquiring asymmetric capabilities that may provide advantage over U.S. forces. The combination of advanced conventional forces and asymmetric capabilities will provide the basis for a modern military force.

China’s likely goals for its military modernization, however—regional primacy and local superiority over U.S. forces—will not be easy to attain. India, Russia, Japan, and even Korea all have formidable military forces, and the capabilities of U.S. forces far surpass those of these nations. Although the war in Iraq has seriously eroded U.S. ground force capabilities, U.S. air and naval forces remain superior to those of China or any other nation. The goal of regional supremacy is probably unattainable for China, absent major changes in the capabilities of the U.S. and other nations, but that does not mean China will stop pursuing it.

**Asymmetric Warfare**

U.S. experts view China’s military not as a peer to that of the United States but rather as an astute challenger. The challenge comes from a combination of increased conventional capabilities and from the pursuit of asymmetric advantage—using new weapons and tactics to attack an opponent in areas where it is weak or vulnerable. Seeking asymmetric advantage is not new, nor is China the only

---

PHOTO BY JOAN LEBOLD COHEN.
country to seek it. Potential U.S. opponents, including China, currently plan to gain asymmetric advantage to counter U.S. force-projection capabilities (the ability of the United States to rapidly deploy ships, aircraft, and troops to any region of the world, including northeast Asia); they are looking as well for ways to erode the U.S. military advantage by attacking information and communications assets, including satellites and networks.

China’s military is developing weapons and tactics programs to achieve these goals. The most dangerous of these programs are those targeting U.S. aircraft carriers. China has acquired many of the technologies that the Soviet Union developed to attack U.S. carriers, and China is refining those technologies and the tactics needed to use them. China is also developing sophisticated antisatellite capabilities as part of a larger strategy for information operations, but although it has expended considerable effort on both those fronts, neither has reached the stage where they pose much risk to U.S. military superiority.

Antisatellite Weapons

China’s antisatellite test in January 2007 received much attention in the West, but the test should not have been a surprise. The Chinese have been working on antisatellite weapons for at least a decade. The particular weapon China used in the test—a kinetic intercept of a low-Earth-orbit satellite—is the least sophisticated mode of antisatellite attack; the Soviets and the United States developed, tested, and abandoned that mode decades ago.

Public reports in the West speculate that China is also working on ground-based lasers and perhaps attack satellites. Other tactics that the Chinese might use against U.S. satellites include cyberattacks against the ground facilities and networks that control U.S. space assets or jamming of signals from satellites, in particular from the Global Positioning System (GPS).

Information Warfare

China’s antisatellite programs should be seen in the context of a larger effort to gain asymmetric advantage and to erode U.S. capabilities by attacking its information assets. Because a good portion of the U.S. advantage in combat comes from satellite data, potential opponents such as China are searching for ways to interfere with these services and the networks that support them. U.S. experts say the Chinese are also likely putting considerable work into denial and deception efforts—efforts to mislead opponents by denying them information about their military or by providing them with false information. These efforts include the jamming of satellite signals, interference with networks, and spoofing of targets. Spoofing can involve, for example, carefully studying the signature of

Red Army guards in formation at the Forbidden City. PHOTO BY TOM CHRISTENSEN.
a target weapons system that the U.S. sensor collects and then duplicating that signature in a decoy. Such denial and deception tactics may actually be of greater concern to an opponent of China than are antisatellite efforts because a skillful combination of concealment, mobility, and deception has had some success against U.S. technical collection—that is, the collection of intelligence through the use of sensors (such as radar, infrared imagery, or photographs) or through the interception of radio signals or other electronic emissions.

As suggested earlier, denial and deception are one aspect of information warfare. If sensors collect erroneous data, the decisions based on that data also will be erroneous. Another information warfare tactic is to corrupt stored data or to damage the computer networks that process and distribute data and support decision making. Government sources in the United States say that China has targeted U.S. information systems as a vulnerable component of the U.S. style of combat.

Information technologies are a primary target for asymmetric attack. Information includes technological know-how, data, statistics, and news, and the networks and processing technologies that aggregate, process, and distribute information have become an integral part of U.S. power. Gaining information superiority, whether by knowing more than an opponent or by disrupting the opponent’s ability to know, has also become one of the keys to success in conflict in the twenty-first century.

Conflict in cyberspace is clandestine, so assessing intentions and risks can be difficult. The central point to consider in an assessment of cyber vulnerability and the consequences of a cyberattack is the linkage between information systems and military capability. If U.S. military capabilities depend heavily on information systems, cyberattacks will do great damage. If there is redundancy in information systems or if networks are resilient (that is, if they can recover quickly), cyberattacks will do much less damage. So far, vulnerability in a computer network has not automatically translated into a loss of military capability for the United States. The risks and consequences of a cyberattack are routinely overstated in the popular media; a cyberattack would not provide China with a decisive military advantage, U.S. military officials say.

One way to assess U.S. vulnerability and China’s ability to exploit that vulnerability is to ask whether a cyberattack by China launched a few days in advance of a military conflict could prevent U.S. carrier battle groups from deploying to the Taiwan Strait. China could attempt to interfere with telecommunications systems in an effort to prevent deployment, but a successful effort would have to simultaneously disrupt land lines, cell phones, the Internet, and satellite communications—a virtually impossible task in a nation with a highly developed communications infrastructure.

China could attempt to interfere with transportation, whether air traffic control or street traffic signals, to

A submarine of the shore of Shanghai, 1979. Building advanced aircraft carriers and submarines is part of China’s long-term defense strategy. Photo by Joan Lebold Cohen.
make it more difficult for U.S. carrier crews to assemble, although it is hard to see what a cyberattack could add to the gridlock and overcrowding that occur routinely on bad days. China could attempt to interfere with the electrical grid, which could complicate and slow a ship’s departure. Perhaps hackers could take over broadcast radio and TV stations and play Chinese music and propaganda or change broadcast parameters in an effort to create radio interference. But these sorts of annoyances do not provide military advantage.

China also could attempt to interfere with the computer networks that support logistics and supply chains, but because any clash is likely to be a come-as-you-are conflict, there would be no immediate effect. The Chinese also could attempt to disrupt critical civilian infrastructure. This disruption would not seriously affect the deployment of U.S. forces, although it could put China at risk of widening any conflict in exchange for little benefit, since an attack against U.S. civilian infrastructures could easily prompt retaliatory measures.

Some experts worry that surreptitious, long-term cyberattacks on the U.S. economic system might seem attractive to China as a way to weaken the United States before a conflict, but the uncertain benefits of such attacks—and they are uncertain because they might not work and are as likely to damage the economy of China as that of the United States—would have to be weighed against the serious risk and damage that would occur if the effort were discovered.

A better strategy for China in information warfare would be to seek to increase an opponent’s uncertainty. Increasing opposing commanders’ uncertainty degrades the opponent’s effectiveness. Whereas a strategy of denial and deception aims to make opponents believe that they know what is happening (when, in fact, what they believe is wrong), an uncertainty strategy aims to make an opponent unsure about what is happening.

The techniques for carrying out an uncertainty strategy resemble those for carrying out a strategy of denial and deception. One may inject false information into the planning and decision processes of an opponent or manipulate information that is already in that system to make it untrustworthy. There is reason to believe that the Chinese routinely use false or misleading information to manipulate and confuse their opponents. China will more likely pursue an information strategy that seeks to expand uncertainty and confusion rather than unleash an improbable “electronic Pearl Harbor” that would offer only uncertain results.

**Miscalculation**

Overall, U.S. experts think, the United States is capable of handling the threat posed by China’s military modernization in all the areas mentioned. But one area of risk
deserves greater attention: the risk that the Chinese government would miscalculate the U.S. response and the international reaction to a military adventure and that the Chinese government would miscalculate the benefits and effect of antisatellite or cyberweapons on the military balance.

The Chinese clearly miscalculated the reaction to their January 2007 antisatellite test. They did not expect the global condemnation it received: The Chinese Foreign Ministry’s lack of preparation to answer questions about the test suggests that China expected a low-key reaction from other countries, and Chinese officials admit privately that the Foreign Ministry was not consulted or kept fully apprised of plans for the test. This miscalculation reflects a degree of parochialism in Chinese security policy, a lack of experience in international politics, and a certain degree of hubris born of China’s tremendous economic success.

This miscalculation makes it fair to ask if the Chinese could similarly miscalculate the balance of power in the region. Some U.S. experts say it is not inconceivable, for example, that China could overestimate the advantages provided by asymmetric attacks and overestimate the exhaustion of U.S. forces because of the war in Iraq. At times in the past—in 1914 or 1941, for example—authoritarian regimes have made such miscalculations and initiated conflicts that appeared unthinkable.

It is unlikely that China would make this sort of miscalculation, although defense spending has increased by more than 10 percent every year for the past two decades, with a 17 percent increase in 2008 and a 15 percent increase planned for 2009. Official figures probably understate actual spending by 10 percent to 20 percent, and spending on programs to develop asymmetric capabilities is usually concealed. China’s defense budget is now the second largest in the world; over the last two decades the People’s Liberation Army has changed from an overstaffed military with antiquated arms to a leaner force with modern equipment.

Military, Imperial

Diguó jūndui 帝国军队

Beginning with the Han dynasty, the strength and allegiance of the Chinese army were determining factors in the rise and fall of imperial dynasties. China’s willingness to adopt Western science, technology, and other innovations in the first decade of the nineteenth century led to repeated defeats by Western countries and Japan that culminated in the revolution and the end of the imperial era.

Almost all dynasties in China began with a military success, and each ultimately rested on its military’s continued effectiveness. All of them had a dual concern pertaining to their military: how to control the military force to prevent powerful and ambitious generals from revolting and to suppress popular revolts when they occurred; and how to defend the country against invaders.

Citizen-Soldier System of the Han and Tang

During the Han dynasty (206 BCE–220 CE), all males were required to register for military service at twenty, and were considered active for military service for a year, and as reservists until age fifty-six, during which time they would report for military duties for a month each year and could be called up for special campaigns. The logistical difficulties of the system led to the longevity of levying “substitute money” on all draft-eligible men to pay for volunteers. The practice of hiring alien tribesmen to serve as soldiers and the rise of mercenary armies loyal to local leaders contributed to the decline and fall of the Han dynasty.

The army of the Tang dynasty (618–907 CE) consisted of career soldiers from good families who enlisted for long-term service, starting at age twenty-one and retiring at sixty. Military service was esteemed, and good families, including the nobility, vied to have their sons accepted in the army. They formed six hundred garrisons and rotated between the capitals and frontier posts. But by the mid-eighth century the state had to rely on mercenaries recruited from friendly frontier-nomadic tribes. They were commanded by their own generals, such as An Lushan, who led them in rebellion from 755 CE to 763 CE. Since regional armies played an important part in putting down the An Lushan rebellion, they became a permanent feature of the late Tang, contributing to further weakening of the dynasty.

Song and Ming Military Systems

Neither the Song (960–1279) nor the Ming (1368–1644) dynasty suffered from military uprisings or attempted coups. This was due to the ascendancy of the civil service and its control over the military and to the establishment of a professional army with hereditary soldiers. Martial spirit declined as did esteem for soldiering as a career, as evident in the common saying: “The best iron is not to be used for nails; the best men are not to become soldiers.”
The Song dynasty was founded as the result of a mutiny; for this reason the early Song rulers followed a deliberate strategy of subordinating the army to civilian control and rotating commanders among different units to prevent the build up of esprit de corps between them. Song military strategy was based on static defense and diplomacy. Never able to control the northern steppes, where the best horses were bred, and unable to obtain them from the hostile nomads, the Song army relied on infantry forces. Wang Anshi, a tenth century reformer of the Song government, attempted to strengthen national defense and failed to meet their goals: He tried to organize the population into a militia similar to that of the Han and Tang times and to encourage the farmers to raise horses by subsidizing them. Dangerous neighbors kept the Song army large—over a million men—and the cost high. Horses raised by farmers for agriculture were ill suited to cavalry use. Song innovations and inventions for warfare included the military use of explosives in rockets and other projectiles and tank-like carts sheathed in iron plating. But the Song government found it was easier to pay the mighty nomadic neighbors annual tributes of silver and silk than to fight them, and consequently the dynasty produced few distinguished generals. The most famous and heroic among them was Yue Fei (1103–1142), who attempted to win back territory seized by the Jin, was betrayed, imprisoned on trumped-up charges, and murdered in jail.

The Ming army combined Tang and Song features. It relied on a professional and hereditary standing army as did the Song, numbering a million at the beginning of the dynasty and increasing to almost four million by its end. Military units were allocated land to farm in peacetime for their sustenance, though that was usually insufficient and they had to receive subsidies from the central government. It also raised militias from the populations for limited local needs. Rotation of commanders precluded the development of warlordism and forestalled revolts. There were few military innovations during the Ming; by the sixteenth century when Europeans arrived on the coast by ship, China was behind Europe in firearms technology. Thus the Ming government purchased firearms from Europeans and made imitations locally; they asked the Jesuit missionaries, then active in the Chinese court as specialists in astronomy and other scientific fields, to cast cannons, which the Jesuits did in order to acquire protection for their proselytizing activities. After the initial period of military expansion, the Ming government relied on static defense, rebuilding large sections of the Great Wall at its eastern end.

Armies of the Nomadic Dynasties

The Song dynasty was confronted by warlike nomadic neighbors. The two greatest threats to the Song originated from the northeast, beginning with the Liao dynasty, ruled by nomads called the Khitan, who seized lands in present day Manchuria and northeastern China from the
collapsing Tang empire. Too weak to confront it militarily, the Song rulers made peace with the Liao dynasty by paying its annual tribute of silk and silver. By the early twelfth century, a new nomadic people called Jurchen, from northern Manchuria, formed an alliance with the Song and defeated the (by then) decadent Liao rulers.

Subsequent land disputes between rulers (the Song and the Jurchen, who now called their rule the [Jurchen] Jin dynasty, 1125–1234) resulted in defeat of the Song, which ceded all of northern China to the Jin and paid massive tribute in silk and silver. Both the Jin and what remained of the Song (called the Southern Song because it only ruled southern China after 1127) were destroyed by the Mongols. The fifth grand Khan of the Mongols, Kubilai, reunited all Chinese lands under his rule and called it the Yuan dynasty in 1279.

The Liao (916–1125) and Jurchen Jin dynasties organized armies according to their tribal systems. Their strength lay in their cavalries and the martial spirit of their soldiers. Each recruited their Chinese subjects to form auxiliary and subordinate infantry units.

Chinggis Khan (also called Genghis Khan, 1164–1227) organized his Mongol warriors according to a centralized, decimal-based hierarchy of units called hundreds, thousands, and myriads (ten thousand); the armies were commanded by his family members and Mongol nobles. The most elite, consisting mostly of noblemen, formed the ruler’s palace guard. Below the Mongol units were auxiliaries of Central Asians, northern Chinese, and southern Chinese, in descending order of prestige. Chinese units were only issued arms when ordered into battle, and they had to return them when the fight was over. For their support, military units were granted land cultivated by Chinese slaves. The deterioration of the caliber of Mongol soldiers after decades of living a privileged life as occupiers of China contributed to the decline and fall of the Yuan dynasty (1279–1368).

The rise of the Qing dynasty (1644–1912) was made possible by the banner system organized by dynastic founders Nurhachi and Abahai in the early seventeenth century. From the initial eight Manchu banners (each with a different colored or bordered banner or standard), eight Mongol and eight Han Chinese banners were added from the ranks of their early subject-allies, making a total of twenty-four. After conquering China, the elite banner units were stationed at strategic locations throughout the empire. These “bannermen” were hereditary soldiers and forbidden trades and other professions; they were supported by revenue from state lands. Additional but less prestigious units, called the Green Standard, or Banner, Army, were recruited among the general population for less vital garrison duties. Early Qing rulers maneuvered and hunted annually with banner units to keep up their fighting ability. The rise and decline of the Qing dynasty, following the pattern of the Yuan, paralleled the strength and decline of the banner armies as well, which had deteriorated to drone-like men by the late eighteenth century.

Whereas the Chinese civilization in general, and the Chinese military in particular, had been innovative and inventive, and therefore ahead of the West in many areas before the fifteenth century, it fell behind thereafter. Thus, although the Chinese discovered gunpowder and put it to military use, by the time Europeans arrived in China by sea in the sixteenth century, they had better cannons and muskets. Hence the late Ming and early Qing courts asked the Jesuits to cart cannons for them. But even in the early nineteenth century the Qing soldiers relied chiefly on swords, bows, and arrows.

The huge and growing gap in general and military technology between China and Europe resulted in China’s crushing defeat by Britain and France in the Opium Wars of the nineteenth century (1839–1842 and 1856–1860). Because Japan was quick to adopt Western sciences after its opening by the United States in 1834, Japan, too, easily defeated China in the First Sino-Japanese War (1894–95). China’s defeat in foreign wars contributed to the decline and fall of the Qing dynasty—which ended with the founding of Republican China in 1911 and the subsequent abdication of the emperor a few months later in 1912—and to the end of imperialism itself.

**Further Reading**

The Min dialect group is the most divergent and complicated of China’s seven major languages. At least six Min subdialect groups exist.

Min is a geographic short term for “Fujian Province” in China. It is named after the largest river “Min jiang” in the province. Chinese dialectologists have used Min for decades as a linguistic term refering to the Min dialects. Among the seven major Chinese languages—Mandarin, Min, Wu, Yue, Gan, Hakka, and Xiang—the Min dialect group is the most divergent and complicated. Because Fujian is a mountainous province with few navigable rivers and little arable land, its topography has contributed both to the heterogeneity of the dialects and also to migration of people to other parts of China and overseas.

Before the 1960s, when dialect data were scant, the Min dialect group was roughly divided into two subgroups: Minnan (Southern Min) and Minbei (Northern Min). But studies done in the 1990s showed that at least six Min subdialect groups exist: Minbei (Northern Min), Minzhong (Central Min), Minnan (Southern Min), Mindong (Eastern Min), Puxian, and Shaoning. (See table 1.) Most of these groups are mutually unintelligible.

### Fuzhou Dialect

The Fuzhou dialect is a characteristic Mindong dialect whose speakers number more than 1 million and who are found not only in Fuzhou but also in Southeast Asian communities. The Fuzhou dialect, like other Chinese dialects, has differences in literary and colloquial readings for some lexical items but for fewer lexical items than is the case in Minnan (Southern Min).

Fuzhou has fourteen initial consonants \( p, p', m, t, t', n, l, ts, ts', s, k, k', ng, x \), seven vowels \( i, u, y, a, e, o \), seven tones, and just one paired-consonant ending: \( -ng/-q \). The velar nasal \( ng \) may occur alone and forms a syllabic nasal.

The Fuzhou dialect has a unique sound sandhi (sandhi is a term used to describe changes in the sounds of adjacent words), a phenomenon that is rarely found in other Chinese dialects. In words consisting of two syllables, not only does the tone of the first syllable undergo tonal value change, but also the consonant initial of the second syllable undergoes an assimilation change according to the articulation of the coda (syllable ending) of the preceding syllable. For example, the word for “movie” is composed

### Table 1: Speakers of Min Subdialects

</table>

of two syllables: The first syllable, tieng⁶, means “electric”; the second syllable, ing⁳, means “shadow.” Together the two syllables create the compound word tieng⁵nging³, whose first-syllable tone and second-syllable consonant initial have changed.

At times not only the consonants but also the main vowels of the second syllables undergo sound sandhi and become different vowels or diphthongs (gliding monosyllabic speech sounds that start at or near the articulatory position for one vowel and move to or toward the position of another).

Fuzhou also has some grammatical features that differ from Mandarin (China’s national language). For example, in Fuzhou, for animal terms with a gender modifier, the gender modifier follows the head noun. That is, “male dog” is pronounced k’eing⁶xyng³ (dog-male), whereas in Mandarin the gender modifier precedes the head noun: xiong²gou³ (male-dog). This feature is shared by other Min dialects and other southern Chinese dialect groups such as Yue and Hakka. Another example is the presence of a perfective aspect marker to indicate completed action. The phrase “I have seen” in Fuzhou is tau⁶, whereas in Mandarin it is wo³kan⁴le (“I see [aspect]”), where [aspect] is a verbal category indicating that an action is viewed as completed or in progress.

**Amoy**

Native speakers of Minnan dialects are found not only in Fujian Province but also in the provinces of Zhejiang, Jiangxi, Guangdong, Hainan Island, and Sichuan, and as well in the Guangxi Zhuang Autonomous Region and Taiwan. Minnan speakers are also found overseas in the Chinese communities of the Philippines, Malaysia, Indonesia, Myanmar (Burma), Thailand, and Singapore. Minnan dialects have more than 30 million speakers; Amoy, which is spoken by more than 510,000 people, is representative of the group.

Every Chinese dialect has the phenomenon of literary and colloquial readings of characters. The Amoy dialect is known for having the most characters with both readings. The literary form is used only in reading the written language and when using a person’s formal name, whereas the colloquial form is used in all other oral communications. The difference between the literary and the colloquial pronunciation is so great that they can be treated as two parallel phonological (relating to the science of speech sounds) systems. For example, in literary Amoy the word blood is pronounced hui⁷, whereas in colloquial Amoy it is pronounced hui⁷.

Both literary Amoy and colloquial Amoy have six oral vowels (i, e, a, u, o, and ò), but colloquial Amoy has an additional five nasalized vowels (iⁿ, eⁿ, aⁿ, uⁿ, òⁿ). Literary Amoy has sixteen consonants (p, p’, b, m, t, t’, l, n, ts, ts’, s, k, k’, g, h, and ng); colloquial Amoy has one more consonant, the glottal stop, q, which occurs only in syllable final position. The stops p, t, k, and their counterpart nasals m, n, and ng can occur both in the syllable initial and final positions, whereas the other consonants can occur only in initial positions. The nasals m and ng can occur alone as syllabic syllables.

The Amoy dialect has seven basic tones. In both literary Amoy and colloquial Amoy, whenever a compound word or a phrase consists of two or more syllables, the syllables preceding the last one must undergo tone sandhi except when the last syllable is an atonic word (or an enclitic, meaning associated with a preceding word). For example, the word for “soy sauce” is the combination of tau⁶, meaning “bean,” and iu², meaning “oil.” The compound word is pronounced tau⁵iu².

Some of the grammatical features that set Fuzhou apart from Mandarin are also characteristic of Amoy. For example, like Fuzhou, Amoy’s gender markers for animals follow rather than precede the animal. Word order in some compound words is also reversed. For example, in Amoy “guest” is lang⁶k’eq⁷ (people-guest), whereas in Mandarin “guest” is ke⁴ren² (guest-people). Amoy also uses a perfective marker to show completed action.

**Jian’ou**

The Jian’ou dialect, with more than 437,000 native speakers, is a representative subdialect of the Minbei (Northern Min) dialect group. It is spoken by people in the northern part of Fujian Province. It contains fourteen initial consonants (p, p’, m, t, t’, n, l, ts, ts’, s, k, k’, x, ng), nine vowels (i, u, y, e, ê, ë, a, o, ò), six tones, and one consonant ending (-ng). Because of its adjacency to the Mindong dialect area, it shares some phonological features with
Fuzhou. For example, both have rounded front vowels (y, œ), more diphthong main vowels, and only one nasal ending (-ng).

**Yong’an**

Yong’an is a representative subdialect of the Minzhong (Central Min) dialect group, which is surrounded by Minbei dialect to its north, Minnan to its south, Mindong to its east, and Hakka to its west. It has both Min and Hakka dialect features. Native speakers of Yong’an number about 265,000. It has sixteen initial consonants (p, p’, m, t, t’, n/l, ts, ts’, s, tš, tš’, š, k, k’, x, ng), ten oral vowels (i, Ï, u, û, y, e, ø, a, o, â), four nasalized vowels (iₙ, on, aₙ, uₙ), and six tones. It contains two consonant endings, bilabial nasal -m and velar nasal -ng. The bilabial nasal m may occur alone as a syllabic syllable.

**Puxian**

The Puxian dialect (莆仙方言 Puxian fangyan) is spoken between Minnan and Mindong. Thus, it shares some linguistic features with Minnan and Mindong. Puxian is representative of this dialect group. Its native speakers number almost 1.5 million. It contains fourteen initial consonants (p, p’, m, t, t’, n, l, ts, ts’, s, tš, tš’, š, k, k’, x, ng), eleven vowels (i, u, ē, e, ø, a, o, ô, A), and six tones. It has two consonant endings, velar nasal -ng and glottal stop -q. The velar nasal may occur alone as a syllabic syllable. Puxian has sound sandhi similar to Mindong and a colloquial and literary system similar to that of the Minnan dialect.

**Shaowu**

Shaoning dialect 邵宁方言 (Shaoning fangyan) is spoken by people in the northwest part of Fujian Province. Shaowu is representative of this dialect group. Its native speakers number just more than 258,000. It is adjacent to Minbei to the east, Gan dialect (in Jiangxi Province) to the west, and Hakka dialect group to its south. Its status has been controversial for years, with some scholars claiming that Shaowu is a Min dialect, whereas others claim it is a Hakka dialect. Based on the historical sound changes and dialect specific lexicon, it currently is considered to be a hybrid dialect, a mixture of Hakka-Gan and Min. Shaowu has nineteen initial consonants (p, p’, m, f, v, t, t’, n, l, ts, ts’, s, tš, tš’, š, k, k’, x, ng), eight vowels (i, ī, u, ū, y, e, ë, a, o, ò), eight nasalized vowels (iₙ, on, aₙ, uₙ), and six tones. It has two consonant endings: an alveolar nasal -n and a velar nasal -ng. The velar nasal may occur alone as a syllabic syllable.

**Further Reading**

China has extensive mineral resources that are critical to the development and success of a modern, economically diverse economy. As China increases foreign exports and domestic consumption of these resources, more attention must be paid to exploiting these resources in a sustainable fashion.

The huge size of China—nearly 9.6 million square kilometers—anticipates the considerable diversity of geologic and landform genesis processes that ultimately must be credited for the nation’s rich and extensive mineral resource base. As a consequence of the geologic forces (metamorphic, sedimentary, and igneous) that create and concentrate exploitable subsurface mineral resources under different environmental conditions over millions of years, the country has some of the most extensive mineral deposits on Earth.

China is at or near the top of the list of all nations in gross potentially exploitable reserves of many strategic metals and ores. For example, China in 2007 was first among all nations in the production of coal, crude steel, fertilizer (phosphate, potash), and chemical fibers. China is also among the world’s four top producers of antimony, tin, tungsten, and zinc, while ranking second in the production of salt, third in gold, fourth in silver, eighth in lead, and approximately sixth in crude petroleum. Uncertainty about the supply of crude petroleum underscores a number of common problems in the estimation of energy resources and reserves, since exploration is ongoing while domestic production varies significantly from year to year in response to the price of imports vis-à-vis domestic production costs.

Nevertheless, China’s diverse and extensive strategic mineral resources, exploited at ever-growing rates, guarantee that the nation will be a major player, as both an importer and exporter, in the global trade in many strategic minerals for the foreseeable future. Concerns among the international community tend to focus on the growth of China’s imports of energy resources, especially oil and natural gas, steel, gold, and silver, because of the effect these imports are already having on global markets and prices. Overlooked, however, is the fact that the country is an increasingly important exporter of raw and semi-processed minerals as well. China’s leading export minerals include tungsten, antimony, tin, magnesium, molybdenum, mercury, manganese, barite, and salt.

China’s extensive in-ground reserves and growing production of minerals and ores reflect only part of the story. But if China’s resources are evaluated on a per capita basis, concerns expressed by both domestic economic planners and the international community regarding current consumption levels and projected future shortages of metals and energy are more understandable. Per capita amounts of many of the same minerals and ores listed earlier are often quite low because of the nation’s population of 1.33 billion (2008). China’s population is projected to increase at least for the next quarter-century, while per capita consumption of energy and industrial metals or ores during this same period is expected to continue to skyrocket because of China’s racing economy—still predicated largely on manufacturing. This situation, then, is an
important point of departure in considering the nation’s reserves and contemporary use of important mineral resources. What is important is not simply how much a nation potentially has available in absolute terms, but rather how many people are dependent on the reserves as they move from the ground via manufacturing processes to the marketplace.

Indeed, realization among China’s top leaders that the nation’s economic growth will slow or stagnate without adequate supplies of industrially important minerals and nonrenewable organic sources of energy (coal, natural gas, petroleum) has prompted startlingly different foreign policy initiatives and “alliances” during the last decade. Despite the indisputable logic of such a pragmatic diplomacy, many in the international community have been taken by surprise by the pace and extent of China’s new roles on the international stage. Seldom can international trade and diplomacy be separated, and nowhere is this truer than in contemporary China. Foreign policy initiatives include controversial bilateral agreements with oil-rich nations such as Sudan, Iran, and Venezuela, but more important and potentially enduring are efforts to forge closer relations (and build pipelines) with Russia and other central Asian nations such as Kazakhstan. Furthermore, mutually beneficial aid-based diplomacy throughout Africa has placed Chinese engineers and construction teams in dozens of African nations. Chinese nationals are now routinely found building roads, irrigation systems, and dams as well as operating mines under contract and as joint ventures throughout the continent and more recently in many places in Southeast Asia. It should come as no surprise that many of these same nations are exporting growing volumes of ores and minerals (including organic fuels) to China while also serving as export markets for Chinese manufactured goods. An assessment of China’s mineral reserves, use, and consumption then must be viewed not as a set of arcane facts but rather as a critical factor influencing China’s international diplomacy actions and initiatives as the nation’s role in the global economy grows.

The Global Workshop

Since market-oriented economic reforms were instituted in December 1978, China’s economy as measured by gross national product (GNP) has grown at or near double-digit rates. Mineral resource use then is being driven both by increases in domestic consumption of energy and manufactured goods and by the nation’s more recent and expanding role as the “global workshop.” This remarkable increase in productivity fuels the use of domestic supplies of ores, metals, and energy resources at expanding rates. As the role of centralized planning in mining and metalurgy firms declines, prices, production, and consumption of strategic metals and energy resources are increasingly determined by international market prices—not by domestic availability.

For many heavy industrial firms, central planning once exclusively determined the sources of metals and energy used in production, and prices for these materials were set by the government. Increasingly the international price of these commodities determines if imports or domestic supplies are used by these same firms. This is not to say that the role of the state with respect to the management of mineral resources has diminished anywhere near the extent found in Western nations or Japan and South Korea. Domestic prices are still controlled by state-established “ceilings and floors,” and markets for many minerals and metals used in manufacturing are allowed to fluctuate only within this range. Although most light manufacturing firms have already made the transition from state-owned enterprises (SOEs) to diverse forms of private ownership (private, publicly traded, joint ventures), the government has moved more cautiously in the case of mines, metal-processing and smelting companies, and energy-related firms. For example, crude petroleum markets are controlled almost exclusively by state-owned megafirms. Coal, on the other hand, is produced both by state-owned firms (including local government-owned firms) and private operations. Subsidies are still provided for state- or local-government-owned mines, smelting operations, and other processors, but these are now determined on a case-by-case basis as the country works to close inefficient and/or dangerous mines and processing plants. Clearly, however, the privatization of these operations is under way, with a growing number of firms—especially new ones—being encouraged to operate as private enterprises based on shareholding, even when local or provincial government monies are involved. Ironically, many of the most dangerous mines are privately owned or owned by local governments, and the central
government now finds itself in the uncharacteristic role of “protector of the working man,” trying to close dangerous small mines while facing resistance by local governments dependent on these revenues.

Typically mineral resources are grouped into three categories: energy resources, ferrous metals and ferroalloys, and nonferrous metals and minerals. (See table 1.) Extensive scientific resource surveys for all three categories initiated in the mid-1980s and conducted almost continuously since that time have resulted in much clearer assessments of mineral resources than at any other time in the nation’s long history.

China’s growing industrial might and its increasing production and consumption of minerals and industrial metals such as copper, iron, and tungsten are already having myriad impacts on global markets. A poignant example is the fact that prices for scrap steel (heavy melt scrap)—essentially flat in the United States for the preceding decade—almost tripled to $225 a ton from 2001 to 2007 on the back of massive increases in exports, with 50 percent of these exports going to China. This is good news for scrap yards but bad news for U.S. steel manufacturers who depend on scrap as a component in new manufactures, including automobiles and consumer durables such as appliances. A new industrial lobbying group representing metal processors in the United States was formed in 2000 in response to the instability that the growing economies of China and India have visited on prices and availability of scrap metal.

### Fossil Fuel Reserves

Nothing can be processed or manufactured without energy, and China’s growing participation in global energy markets has caused the greatest concern and greatest impacts to date on global markets. Simply put, China’s domestic reserves of fossil fuels are quite modest when compared with current and future domestic demand. Estimated oil reserves—although still changing because of ambitious exploration efforts often conducted jointly with international firms—range between 20 and 30 billion barrels. Estimated consumption is growing from about 5 percent to 7 percent per year (depending on the source), meaning that in twenty years or so China will be out of domestically produced oil. New technologies will extend this timeline slightly, but China will be one of the top two U.S. major petroleum buyers within a decade, and as noted earlier China has adopted a series of ambitious foreign policy initiatives directed at assuring supplies in anticipation of this demand. In addition to these political solutions, petroleum and natural gas exploration, especially in far western Xinjiang and the South China Sea, is a government priority. Shallow areas thought to have significant reserves within the South China Sea, such as areas around the Paracel and Spratley islands, are claimed by many nations, including Vietnam, the Philippines, Brunei, Malaysia, and Taiwan. These multiple claims represent important barriers to production from these areas—even if greater deposits are identified.

In contrast to petroleum (vital for transportation), China has massive coal reserves, typically considered to be third behind those of the United States and Russia. Coal reserves are estimated to be 120 billion tons, which—at current rates of consumption—will last almost

one hundred years. Of course, the dilemma in China as elsewhere is how to burn the coal cleanly and more efficiently and how to convert the coal to fuels that can be used for transportation.

Given expected shortages, the current high costs of coal conversion, and the political issues related to increased crude oil production, it should come as no surprise that China is investing heavily in nuclear power, hydropower, and alternative energy. Historically unprecedented hydropower dam construction, including the recently completed and controversial Three Gorges Dam, must be viewed in this context. Wind farms are increasingly common off the eastern coasts and in Xinjiang and Qinghai in the far west. Zoning and local resistance limit the growth of wind-generated energy in the United States, but, for a nation whose citizens must routinely accommodate cut-offs or partial brown-outs, having the lights go on when the switch is flipped is worth the loss of the “view.” Although all of these alternative efforts will undoubtedly help mitigate energy shortages, new technologies focused on converting coal to liquefied gas and an ambitious program for nuclear power plant construction are probably more important in the short to medium term of the next twenty years.

Distribution of Resources

The distribution of China’s mineral resources has an interesting “geography” that has had direct and enduring effects on the nation’s economic development. Except for a limited number of elements or compounds largely concentrated by sedimentary deposition or fluvial redistribution in basins, such as bauxite, salt, natural gas, coal, and petroleum, most ores and minerals are found in mountainous areas—as is the case in all nations. The massive heat and pressure generated through metamorphic and igneous processes work to concentrate ores and minerals into commercially exploitable deposits. Mountains and minerals then are closely associated. Most of China’s mountains are located in the western and central regions of the nation; as a consequence, so are most of China’s mines and commercially exploitable mineral deposits, although there are important exceptions, such as iron.
But the vast majority of the country’s population is concentrated in the large and rich alluvial areas of the east and southeast coasts or in the Sichuan Basin (Red Basin). In part the high population density in these areas is testimony to China’s agrarian past, but on all the continents people tend to concentrate within flat, well-watered coastal areas where transportation and the construction of cities are easier. This was true even before the global mercantile era began but is even more true since. Pacific maritime trade became vital to China’s economy from the Song dynasty (960–1279) to the present (albeit with a few interruptions during the dynastic era). Of course, greater concentrations of people resulted in greater concentrations of capital and wealth, which in turn meant that the lion’s share of the factories of all types that emerged during the past 150 years were largely located in these areas as well. This fact resulted in what might be thought of as a locational mismatch in which mineral and ore deposits are concentrated in the interior, whereas the firms that process these resources are most often located within the more prosperous eastern region. Massive investments in transportation (road and rail), especially since the Great West Development Plan was instituted in 2000, can in part be credited to efforts by Chinese planners to reduce transit costs for western-sourced raw materials moving to the factories within the east or, alternately, to establish more factories in the west that convert minerals and ores to higher value-added products through the manufacturing process. Greater industrial production in the west raises incomes and tax revenues for development while slowing the eastward migration of “the best and the brightest” as well. Still, at present imported metal products such as sheet steel or I-beams from more efficient plants in South Korea or Japan are often cheaper than the same products produced in interior China because of these high transportation costs.

Ming and Qing Novels ▶
During the Ming and Qing dynasties, highly educated literati increasingly used the long fictional narrative as a popular vehicle to engage in sophisticated storytelling. Drawing on historical events and personal experience, and on popular tales, anecdotes, and legends, novels by these authors provide us with some of our most illuminating sources on Chinese life in the early modern period.

The Ming (1368–1644) and Qing (1644–1912) dynasties witnessed a great flowering of long prose narrative fiction, especially from the sixteenth century onward. Despite the relatively low status of fiction as a genre in Chinese culture, especially when compared with poetry, highly educated writers increasingly turned to novels in the Ming period to express their artistic visions and their moral critiques of society. Before the nineteenth century they tended to publish their works anonymously or under pseudonyms, but with the growing prosperity of the late Ming period and the rapid expansion of the printing industry their works of fiction found a large and growing readership. Confucian orthodoxy had long looked down on fiction as frivolous, morally suspect, and likely to lead readers astray with tales of sex, violence, and villainy. By the late Ming period defenders of fiction argued, to the contrary, that because fiction can capture and hold an audience’s rapt attention, it is in fact one of the best vehicles for the spread and popularization of humane and civilized values.

**Late Sixteenth Century**

In the late sixteenth century a number of great novels appeared, all of them based to some degree on shorter works and popular themes from previous eras; one even appropriates an historic figure, using much artistic license of course, and creates a fantastical group of animals to guide him on his journey.

**Romance of the Three Continents**

"Romance of the Three Kingdoms" (Sanguo zhi yanyi 三国志演義), a sweeping historical saga in 120 chapters based on actual historical figures and events, tells of China’s division into three competing kingdoms after the collapse of the Han dynasty (206 BCE–220 CE). The focus on the story is the rise and fall of states based on the talent, wisdom, luck, and loyalty (or lack of loyalty) of its leading statesmen and generals. It was long popularly assumed in China that the Mandate of Heaven—the belief, dating from the Zhou dynasty in the eleventh century BCE, that a benevolent Heaven grants political power only to the moral leader—went to the most virtuous competitor for power, but in this story virtue is less decisive than ambition, cunning, determination, and at times blind luck or the unpredictable interventions of fate. Although highly fictionalized, "Romance of the Three Kingdoms" has given...
many ordinary Chinese their basic understanding of the dynamics of power in imperial Chinese history.

**WATER MARGIN**

*Water Margin* (*Shui hu zuan*, 水滸傳), is a long rambling narrative ranging from 71 to 124 chapters, depending on the edition, based on popular stories about a band of 108 outlaws from the thirteenth century. It has been famously translated in English as *Outlaws of the Marshes* by Sidney Shapiro in the 1970s, and in an adaptation by Pearl S. Buck called *All Men Are Brothers*. These rough and ready, larger-than-life heroes are forced into banditry by their impulsive but noble resistance to injustice and to the corruption of the imperial government. Many critics have complained about the violence and brutality in this novel, but most readers have relished the drama of the story and enjoyed its hard-drinking, fun-loving bandits who might murder without a moment's reflection but who would also gladly give up their lives for their fellow bandits. In a society where young people owed their elders and teachers automatic obedience, *Shui hu zhuan* has afforded each young generation the vicarious thrill of rebellion and defiance of authority.

**JOURNEY TO THE WEST**

*Journey to the West* (*Xiyouji*, 西遊記) is a fanciful retelling (in one hundred chapters) of the life of the Chinese monk Xuanzang, who journeyed to India in 629 CE and returned in 645 CE with hundreds of sacred Buddhist scriptures whose translation he oversaw for the rest of his life. In his fictional incarnation Xuanzang is a timid and fearful soul who succeeds despite himself with the able assistance of
four talking divine animal spirits, of whom the most important are the impetuous adventurer Monkey (Sun Wukong) and his lazy sidekick Pigsy. The comic interplay of these contrasting characters is quite captivating as they face a host of demons, ghosts, fallen angels, and monsters on their way through the mountains and deserts of central and Southwest Asia. The novel can be read as a Buddhist allegory of the quest for enlightenment, a gentle Daoist satire of human frailties, or a Confucian call to moderation in all things. However it is interpreted, it is above all a pleasurable adventure story and has enjoyed many modern incarnations in operas, films, and cartoons.

**GOLDEN LOTUS (JIN PING MEI)**

*Jin Ping Mei* is a different kind of novel, an erotic story of a hedonistic urban merchant, Ximen Qing, and his six wives (or to be more precise, one wife and five concubines or maids). The most ambitious of these women is Golden Lotus, who exploits Ximen Qing’s weaknesses to the extreme in order to triumph over her rivals for his affections. The daily lives of these urban pleasure addicts are chronicled with loving care by the narrator, who weaves together popular songs, plays, stories, and poems into a comprehensive portrait that, despite its erotic theme, he can claim as a moral tale because the protagonist dies two-thirds of the way through the story, a victim of his own excesses.

**Seventeenth and Eighteenth Centuries**

Many other notable novels were published in the seventeenth and eighteenth centuries, although only two rivaled the aforementioned four works in their prominence: *The Scholars* and *Dream of the Red Chamber*.

**THE SCHOLARS**

*The Scholars* (Rulin waishi), written by a frustrated literati, Wu Jingzi (1701–1754), who failed the civil service examinations, is China’s first great satirical novel. With an unforgettable series of comic villains, heroes, and antiheroes, Wu Jingzi explored the pressures of competing for status in the eighteenth century when one could win fame and fortune by passing the examination—or by a whole variety of alternative strategies, including publishing one’s poetry or writing model examination essays, holding fashionable poetry parties in idyllic settings, selling or giving away one’s paintings, socializing with the successful and prominent, or even impersonating the famous in gullible circles.

**DREAM OF THE RED CHAMBER**

*Dream of the Red Chamber* (Honglou meng), also known as *Story of the Stone* (Shitou ji). is universally recognized as China’s greatest novel and was written by Cao Xueqin (d. 1764) at about the same time as Wu Jingzi worked on *The Scholars*. A masterpiece of narrative prose, the novel chronicles the gradual decline of the Jia family against the backdrop of a Buddhist-Daoist mythological framework. The novel emphasizes the themes of contrasting and alternating interplay of joy and sadness, good and evil, beauty and depravity, illusion and reality. No other Chinese novel succeeds as well as *Dream of the Red Chamber* in creating vivid and individualized characters of great psychological depth.

**Late Qing Novels**

Many other notable novels were published in the late Qing period. Many sequels to *Dream of the Red Chamber* were written, although most fell far short of Cao Xueqin’s narrative mastery. *Flowers in the Mirror* (Jinghua yuan) by Li Ruzhen, a fantasy novel from the early nineteenth century a bit like *Gulliver’s Travels*, portrays a series of societies that mirrors and/or satirizes Chinese society. In the late nineteenth century several novelists, including Liu E (1857–1909) and Wu Woyao (1867–1910), emulated Wu Jingzi in writing biting satirical portraits of Chinese society in, respectively, *The Travels of Lao Cao* (*Lao Can youji*) and *Bizarre Happenings Witnessed over Two Decades* (*Ershi nian mudu guai xianzhuang*). These exposés, written against the backdrop of China’s humiliating encounters with Western military and economic might, were powerful critiques of Chinese society, foreshadowing the critical and Western-influenced fiction of the May Fourth Movement in the 1920s.
All of these novels are among the most enjoyable and illuminating introductions to Chinese life in the Ming-Qing period.

开卷有益

Kāi juàn yǒu yì
The Ming dynasty was established by a peasant rebel who overthrew the Mongol-ruled Yuan dynasty (1279–1368). Over the course of the Ming, the Chinese population grew dramatically—and although the Ming court and its bureaucracy grew increasingly ineffectual, trade, agriculture, and the arts flourished.

The Ming dynasty (1368–1644) was a period of dramatic transformation in the Chinese social and political order. The dynasty began with vigorous efforts by the court to consolidate imperial power and authority over the empire with a vision of stable agrarian society and a small, compliant bureaucracy. By the seventeenth century, a series of ineffective and retiring rulers presided over a vast and largely dysfunctional bureaucracy. By this time, Ming society had been thoroughly reshaped by the emergence of a dynamic economy, fed by elaborate market networks, a burgeoning agricultural sector, and flourishing artisan industries. Ming commodities—silk, porcelain, and tea—found their way to major cities around the globe and the increasingly monetized Ming economy was in turn fed by a dramatic influx of silver from Japan, Europe, and the New World.

Zhu, the Hongwu Emperor

The dynasty was founded in 1368 by Zhu Yuanzhang (1328–1398), a military man of peasant origins, driven by desperate poverty to become a Buddhist monk in his youth. In the chaos of the last decades of the Mongol-ruled Yuan dynasty (1279–1368), Zhu rose to the head of a rebel peasant army, his forces competing with other warlord groups in the southeast. In 1356, he succeeded in conquering Nanjing, one of the major urban centers in the region and an important Yuan stronghold. He renamed the city Yingtian, “Responding to Heaven,” a clear signal of his imperial ambitions. In 1368, months before his generals routed Mongol forces from the Yuan capital at Dadu (Beijing), he announced the establishment of the new dynasty, the Ming, meaning “Brilliance.” Some scholars have speculated that the name came from the emperor’s early religious associations with Buddhist millenarian groups.

Much of the early years of the dynasty were preoccupied with military concerns as Zhu consolidated the territorial boundaries of the Ming, driving back Mongol forces to the north and subduing non-Han tribes in Yunnan to the southwest. Under the founder’s reign, the Ming army eventually grew to 1 million soldiers. The ruler’s military concerns were reflected in the reign title that Zhu Yuanzhang chose for himself: Hongwu, or “Grand Martiality.” Although the emperor retained a number of scholarly advisors, many of his top officials were military men, some of whom were granted hereditary titles and were married into the imperial family.

Early Ming Institutions

The institutions of the early Ming were built largely along the lines of the preceding Yuan dynasty. A central
executive secretariat, directed by a chancellor, oversaw the central government with the six traditional ministries: Rites, Personnel, Revenue, Works, Justice, and War. Based upon the semi-autonomous regional administrative units of the Yuan, the Ming created a layer of provincial governments for the first time in Chinese history. An education system was established to teach Confucian principles and texts at a National University at the capital, with a network of schools in the prefectures and counties. A firm believer in the importance of law, the Hongwu emperor quickly ordered the creation and promulgation of a comprehensive law code.

The civil service examination system, implemented briefly and sporadically under the Yuan, was restored in 1370 as the primary means of civil service recruitment. Like the Yuan system, the curriculum was largely focused upon Song dynasty (960–1279) neo-Confucian teachings and commentaries on the Confucian Canon. The Hongwu emperor was ambivalent towards the examination system, suspending it in frustration after the second examinations in 1373. The system was restored in 1385 and remained in place until the end of the dynasty. The emperor remained deeply frustrated and suspicious of his government officials. He launched frequent and vicious purges of the bureaucracy, the military and the general populace, executing thousands in campaigns that destabilized and frequently paralyzed the young dynasty.

In 1380, the central administration was dramatically changed when the emperor charged the chancellor with treason, executed him, and abolished the position forever. The immediate effect was to transfer an overwhelming administrative burden to the emperor himself. The long-term effect was a less structured relationship between the emperor and his bureaucracy. Soon afterward, the Hongwu emperor appointed a small group of scholars chosen from the top echelons of the bureaucracy to advise him informally and relieve some of his administrative responsibilities. This body eventually evolved into the formalized institution of the Grand Secretariat, which remained at the top of the bureaucratic power structure for the rest of the imperial era.

The abolition of the chancellor position and the ferocious temperament of the founder were two of the several factors that laid the course for the autocratic nature of Ming government. While scholars have debated the degree of actual control that various Ming emperors had over the realm, their ability to exercise arbitrary power is unquestioned. Over the course of the dynasty, officials were frequently subjected to humiliation and public beatings, sometimes resulting in death. Independent surveillance networks established by the court intensified the risks of bureaucratic service.

In his drive to restore a stable order after the chaos he experienced in the late Yuan, the Ming founder established an array of social policies to regulate local society. He wrote elaborate admonitions to be posted in every community, urging the populace to live harmoniously and virtuously. Extensive travel was forbidden and commoners were only allowed to journey short distances from their homes. Local communities were responsible for the maintenance of order and for mutual surveillance. Local
wealthy families were charged with supervising the tax collection process. Registration of the population and the land was undertaken in the 1380s and early 1390s, with records that formed the basis for determining the tax, corvée (labor paid in lieu of taxes) and military service quotas of each community. Once these quotas were established, many of them remained fixed for nearly two centuries, until the tax system was significantly revised in the late sixteenth century. By then, official records bore little resemblance to the realities on the ground, as the population had doubled from the estimated 60–80 million in the beginning of the dynasty.

The Hongwu emperor also left behind strict governing regulations for his own imperial family. He clearly
established the rule of primogeniture, partially in reaction to the succession battles that plagued the Yuan. Several of his sons were set up as hereditary princes, strategically placed in charge of garrisoned fiefs throughout the realm. The princes were to enhance the military security of the empire, but strict orders were given not to interfere in affairs at the imperial court.

**Yongle Reign Begins**

After the founder’s death, this nascent political order was violently fractured by civil war in 1399, when one of his sons, Zhu Di, the Prince of Yan (modern Beijing), went to war against the imperial forces of the founder’s grandson, the twenty-two-year-old Jianwen emperor (reigned 1398–1402). Various princes were aggravated by imperial plans to rein in their power and resources, and the Prince of Yan clearly coveted the throne. The civil war devastated much of the countryside that had barely recovered from the warfare of the dynastic transition. By 1402, the armies of the Prince of Yan had reached Nanjing. The palace was burned to the ground in the battle, the Jianwen emperor dying in the flames (though some claimed that he miraculously escaped). Zhu Di thereupon ascended the throne as the Yongle emperor (reigned 1402–1424).

The course of the Ming dynasty was so dramatically reshaped by the Yongle reign that some historians have called it a “second founding” of the dynasty. The new emperor was deeply aware of the need to quickly rehabilitate the empire after the destructive civil war. Although he launched a severe purge against many of Jianwen’s top officials, Yongle deliberately charted policies to placate the wary scholar-official community. The civil service exams which had been erratically implemented in the early years of the dynasty were now regularized. He brooked no opposition to his policies, although he did not terrorize the bureaucracy in the way that his father had. He recruited large numbers of the literati into his service by commissioning several large scholarly works, including the *Yongle dadian* (Grand Compendium of the Yongle Reign), authoritative compilations of the Confucian Five Classics and Four Books, a massive anthology of neo-Confucian teachings, and a new expansive edition of the Buddhist scriptural canon, the *Tripitaka*.

Under Yongle’s direction, the capital was moved from Nanjing to Beijing, signaling that he intended the north to be center of military and political power in the realm. Here the emperor ordered the construction of the monumental “Forbidden City,” which served as the imperial palace complex until the fall of the Qing in 1912. The move of the capital was one of the largest projects of the Ming dynasty. The emperor relocated 10,000 households to establish a metropolitan population at Beijing and the move itself took most of Yongle’s reign to accomplish. Though no longer the capital, the region around Nanjing retained a special status as the “southern metropolitan district,” with several auxiliary branches of the administrative institutions of the capital.

In a departure from the domestically-focused vision of his father the founder, Yongle aimed to assert Ming political power and prestige as far beyond its borders as he could, launching several successful attacks on the Mongols to the north and a protracted and ill-fated military expedition into Vietnam. From 1405 to 1433, a series of flotillas were sent to project Ming power into the Indian Ocean. Commanded by the eunuch admiral Zheng He (1371–1433), these voyages reached destinations as far as Sri Lanka, the Persian Gulf and the coast of present-day Mogadishu. Numerous kingdoms on the Indian Ocean sent tribute to the Ming court. Eventually, the expeditions were abandoned, presumably for their strain on the imperial budget.

**Decline of Dynastic Power**

Successors to the Ming throne proved far less powerful and capable than the Hongwu or Yongle emperors. Over the course of the fifteenth century, the dynasty saw a diminution of imperial power and sway. One major incident in this declining prestige of the court was the capture of the Zhengtong emperor (reigned 1435–1449 and 1457–1465) during a raid against the Mongols in 1449. The return of the imperial hostage the following year caused further turmoil as his brother, the Jingtai emperor (reigned 1449–1457), had ascended the throne in the meantime, refusing to step down and placing his brother under house arrest instead. With the Mongols as a constant threat to the integrity of the empire, the Great Wall was continuously expanded and fortified as a bulwark against further incursions.
One factor that contributed to the volatility of the Ming political order was the influence of eunuchs at court. The Ming founder had stipulated that palace eunuchs be kept illiterate and be assigned only menial tasks. Yongle, however, had allowed eunuchs to be trained and frequently charged them with important tasks (such as the exploratory missions under Zheng He). Under subsequent emperors, eunuchs evolved into a powerful constituent force within the imperial court, frequently in control of the great wealth of the imperial household treasury. They also directed the fearsome Eastern Depot, an independent surveillance and interrogation apparatus that lay beyond the civil authorities. By the sixteenth century, the eunuch establishment numbered in the thousands. This network, with its base inside the imperial palace, was frequently at odds with the civil officials who had limited access to the palace grounds and the ear of the emperor. Historical records kept by Confucian scholars castigated the eunuchs for what they regarded as an unchecked and arbitrary abuse of their power and position.

**Rising Economy, Flourishing Arts**

The middle and late Ming period saw a steady rise in economic activity. Agricultural production flourished with the evolution of cash crops of cotton, sugar cane, and indigo. Porcelain and silk industries found ready markets, particularly in the southern urban centers of Nanjing, Suzhou, and Hangzhou. By the early sixteenth century demand for these goods had developed in major cities around the world. The Ming economy became increasingly monetized, a development that was recognized and accelerated by the imperial taxation reforms of the late sixteenth century that commuted all tax and corvée obligations into a single payment in silver.
After Yongle’s expansive forays, the court returned to the founder’s policies that discouraged and restricted foreign trade and foreign contact. By the sixteenth century, however, the court could do little to control the influx of traders from Portugal and other countries. In addition to traders, missionaries from the West arrived on Ming shores in the late sixteenth century. The most famous of these was Matteo Ricci (1551–1610). Ricci and a few of his fellow Jesuits, eventually made their way to Beijing, where they were received at court and eventually developed a rapport with members of the gentry scholar community.

The rising Ming economy fed the growth of an affluent gentry class, a blending of the scholar-elite clans and rising merchant families able to invest their wealth in books and tutors for their sons, hoping for success in the civil service examinations. This was particularly true in the Jiangnan region, just to the south of the Yangzi (Chang) River. This layer of society congregated in the great urban centers of Suzhou, Hangzhou, and Nanjing, while they dominated the resources of rural areas as absentee landlords. These cities were adorned with the ostentatious gardens and mansions of the very rich who competed to demonstrate their wealth and their refined tastes.

As the civil service examination system saw an increasing number of aspirants, quotas became increasingly restrictive and the chances of passing the exams to enter coveted positions in the civil service had become extremely slim. Under such competitive conditions, the examination essay evolved into a highly rigid format called the “Eight-Legged Essay,” a style bound up in strict rules. The examination system produced a vast number of unsuccessful and frustrated scholars who increasingly turned to other diversions and professions, contributing to a flourishing milieu of creative innovation in art, music, literature, and drama. The last century of the Ming saw the creation of some of China’s most famous novels, such as Journey to the West, or The Golden Lotus, as well as popular plays like Peony Pavilion. A vigorous publishing industry fed an avid readership with a wide range of books from cheap pulp to masterful multicolored, illustrated volumes of the literature of the day.

The arts of the late Ming were in large part inspired by a series of thinkers who offered revolutionary interpretations of the neo-Confucian tradition. Wang Yangming (1472–1529) had questioned early prescriptions of study as the means to moral enlightenment, arguing instead for an approach that focused upon the individual’s intuitive powers to think and act appropriately. Wang’s teachings attracted a large following, including scholars like Li Zhi (1527–1602), who argued that Confucians should aspire to the authenticity of the “child-like mind” and eschew the artifice and pretentious hypocrisy of the scholar-elite class. These thinkers valorized emotion, love, and desire as the truest modes of human expression, and these themes therefore figured prominently in the fiction, plays, and poetry of the day.

While the scholar-elite of the early Ming had generally identified with Confucian doctrines and practices, the late Ming gentry dabbled in an eclectic and syncretic array of Buddhist and Daoist teachings and a variety of popular religious practices. Numerous private academies and lay religious societies were formed as venues for study and discussion of ideas and beliefs and for the practice of charity and self-cultivation.

**Domestic and Foreign Disputes**

The political order of the Ming reached its nadir in late sixteenth and early seventeenth century under the reign of the Wanli emperor (reigned 1573–1620). This emperor found himself locked into disputes with an intransigent bureaucracy over various matters including the selection of an heir-apparent. Disillusioned, he refused to hold a court audience for twenty-five years. Pressing court matters, including key official appointments, were left undressed. For its part, the civil bureaucracy was fraught with corruption and contentious factions, paralyzed and incapable of addressing the serious issues of the day. The court came to be dominated by the dangerously powerful eunuch Wei Zhongxian (1568–1627), whose command brooked no opposition. Reformist contingents, such as the Donglin or Eastern Grove Society, moralistically campaigned against official corruption and against the dysfunctional court, but with little success.

The late Ming faced an array of problems that would have challenged the court and bureaucracy even if they had been performing well. The burgeoning economy now operated beyond the scope of governmental control, linked to world-wide systems of trade and dependent
upon a steady influx of foreign silver. When the flow was disrupted in the early seventeenth century, Ming markets fluctuated dramatically and unpredictably. Oppressed by heavy-handed tenancy conditions and caught up in the vicissitudes of the economy, peasants in the late Ming rose up in frequent rebellion.

Foreign threats were a matter of constant concern. Pirates, many of them from Japan, preyed upon international traders and attacked Ming coastal communities with marauding forays that ranged far inland. The threat of Mongol invasion persisted throughout the dynasty. And in the northeast Manchurian tribes began to coalesce into powerful new military groups that threatened Ming borders in the late sixteenth and early seventeenth centuries.

REBELLION AND RESISTANCE

In the 1620s and 1630s, poor harvests and other natural catastrophes led open rebellion in various parts of the empire and an army of peasants under the leadership of a brigand named Li Zicheng (c. 1605–1645) overran the capital in 1644. In a famous fateful decision, Wu Sangui (1612–1678), a Ming general charged with protecting the eastern end of the Great Wall, invited Manchu armies through the pass to help drive back the rebels. The combined Manchu and Ming forces routed Li Zicheng’s forces from Beijing, but then the Manchus placed their own ruler on the throne and declared the new Qing dynasty (1644–1912).

Southern resistance to the Manchu conquest continued through much of the seventeenth century as remnants of the imperial family maintained the semblance of a court in exile until their capture in Burma (Myanmar) in 1661. Resistance against the Qing persisted well into the 1680s, when Ming loyalist forces in Taiwan were finally subdued. Under the Qing, the Ming continued to play such an important role in the scholarly imagination; as anti-Manchu sentiment grew in the nineteenth century, calls were frequently made to “Oppose the Qing and Restore the Ming!”

Ming Maritime Expeditions
Míng Cháo hánghải huódòng
明朝航海活动

The Ming Maritime Expeditions of the early fifteenth century, led by the court eunuch Zheng He, were China’s greatest explorations before the twentieth century. The seven expeditions to Asia and Africa were for purposes of trade and diplomacy, not exploration.

During the early years of the Ming dynasty (1368–1644) China, rather than viewing itself as the Middle Kingdom, which its name 中国 (zhongguo) implies, sent explorers to sea in the seven Ming Maritime Expeditions. The world beyond its borders was not entirely unknown to China; invasions by land had been common throughout China’s history, and Japan was close by sea. But China’s self-sufficiency had precluded any need for maritime commerce, and the expeditions shifted the nation’s attention to a world much larger than was commonly known.

The Ming Maritime Expeditions were led by Zheng He (郑和, also transliterated as “Chong Ho,” 1371–1433) and are generally regarded as China’s greatest explorations before the twentieth century. They were completed decades before European explorers of the late fifteenth century discovered North America.

In the late 1990s several popular books described the expeditions as a departure from Chinese isolationism. But during the fourteenth century Chinese merchants had engaged in trade with the same regions that Zheng He visited decades later. The difference between the trade missions of the late Mongol era (to the mid-thirteenth century) and the Ming Maritime Expeditions is that trade during the late Mongol era (Yuan dynasty, 1279–1368) was carried out by private merchants, whereas those of the early Ming dynasty were funded and organized by the Chinese government.

Much of the change in the Chinese perception of the outside world was the result of moving the capital from Peking (Beijing) to Nanking (Nanjing), which had better access to the sea and to shipping trade routes. The government-supported Ming Maritime Expeditions began with the third Ming emperor, Zhu Di 朱棣, during his reign as the Yongle (永樂, also transliterated as “Yung-lo”) emperor (1402–1424) and ended with a single voyage authorized by his successor and grandson Zhu Zhanji 朱瞻基, the Xuande 宣德 emperor from 1425 to 1435.

Although commercial trade served its own purposes, government-organized expeditions helped to support the tributary state system. This political arrangement helped to establish China as the hegemon (influencer) among all the countries with which it dealt, with the lesser countries sending emissaries and gifts to the Chinese capital and China extending its protection to those countries.

At his birth during Zheng He was named “Ma He” (“Ma” was short for “Muhammad”), and his family’s Muslim religion was tolerated. But in 1368 the Yuan dynasty collapsed, and with the rise of the Ming dynasty this toleration ended, and Ma He’s family was killed. As a young boy, Ma He was castrated but lived to serve the Ming dynasty as a eunuch. He was particularly useful to his new emperor because as a young child Ma He had...
hearing his grandfather’s stories of traveling to Mecca for the hajj (pilgrimage). Although commercial traders had traveled to such regions, official missions for the purposes of diplomacy had not been made until Ma He, under his new name “Zheng He” as an attendant to Emperor Zhu Di, was authorized to plan a series of missions for trade and diplomacy.

Using the resources of the Ming empire, Zheng He directed the building of a fleet of “treasure ships” based on the design of traditional transport ships but far larger. The exact size of the largest of these ships is uncertain because of inconsistent standards of measurement, but even conservative estimates would have given the ships lengths in excess of 122 meters. In addition to the large transport ships, Zheng He’s fleet included naval ship to provide defense, ships to carry animals, including horses, and ships to carry supplies. To prepare for the long expeditions, Zheng He undertook shorter voyages to Japan before departing on the first of the Ming Maritime Expeditions in late 1405.

The expeditions were not voyages of discovery. Maps of the coasts of Asia and Africa had been made before the expeditions began, and maritime trade from China and other countries had been going on for centuries. The Ming expeditions were not for trade as much as for the diplomatic expansion of China’s influence.

**First Voyage**

The first of the expeditions had the goal of reaching the western Indian city of Calicut (modern Kozhikode). The fleet of more than 250 ships and 27,000 men departed Nanjing in July 1405, traveling south to Taiping in Fujian Province. Navigation in sailing ships of the time relied on favorable winds, so the fleet had to wait until late that year to depart for its first stop in the kingdom of Champa, where the city of Qui Nhon is located in modern Vietnam.

From Champa the Ming fleet continued southward to Majapahit on the island of Java in what is now Indonesia. From there the fleet proceeded northwest to Sumatra, then through the Strait of Malacca into the Indian Ocean. Then, as now, ships in the Strait of Malacca were in danger from pirates.

After the fleet was clear of the straits, it continued west for an unsuccessful visit with the king of Ceylon (modern Sri Lanka). Recognizing that the Chinese were not welcome there, Zheng He continued to the fleet’s destination of Calicut. Feeling properly received by the ruler there, the Chinese engaged in several months of trading the materials they had brought for other goods native to India. The stay in Calicut was not simply for purposes of trade; the fleet had to wait for the seasonal shift of the trade winds for its return to China. On the return voyage Zheng He captured the pirate Chen Zuyi in the Strait of Malacca, destroyed or captured several of the pirate’s ships, and brought Chen Zuyi back to Nanjing to be executed. The fleet arrived home in early 1407. Because of the success of this voyage, Zheng He was ordered to prepare immediately for another.

**Second Voyage**

The second voyage of the Ming fleet was to return to Calicut with stops at Champa and Java, as had the first voyage. The fleet also stopped in Siam (modern Thailand) and the Indian kingdom of Cochin (Kochi), located south of Calicut. However, Zheng He did not accompany the fleet on this voyage; instead the fleet was commanded by two other eunuchs who took part in ceremonies recognizing Mana Vikraman, the new king of Calicut. In 1407 the fleet returned to China, where it remained for two years.

**Third Voyage**

The third voyage was more ambitious than the first two, going to countries and ports that had not been visited on the earlier expeditions. Zheng He had to deal with several difficult diplomatic and military confrontations. Leaving Nanjing in late 1409, the fleet proceeded as usual to Champa, then passed through the Strait of Malacca, this time stopping at the port of Malacca. One of the reasons for visiting Malacca was to reinforce the diplomatic relationship between Malacca and China because the king of Siam had challenged Malacca’s relationship with the Ming empire.
From Malacca the fleet continued to Sumatra, then on to Ceylon in an attempt to improve relations with the island. However, Ceylon was in the midst of a civil war, and Zheng He’s diplomacy was rebuffed by one of the warring factions. The Ming fleet continued to Kollam, a port city south of Cochin, then to Cochin and Calicut for a third visit.

Zheng He then returned to Ceylon to deal with the insubordination he had received on his previous visit. Accounts of how he dealt with this matter differ: He either captured the royal family of Ceylon or captured the leader of the group who had rebuffed him earlier. In any case, Zheng He took his captives back to China in June of 1411. His captives were pardoned and returned to Ceylon.

Fourth Voyage

The fourth expedition, which again was led by Zheng He, was the most far-ranging of all the voyages. After two years in China the fleet departed in 1413, visiting the ports that had been visited before (Champa, Java, Malacca, Sumatra, Ceylon, Cochin, and Calicut). The fleet continued westward as far as Hormuz, the entry to the Persian Gulf, where the fleet traded its goods for those of the Arab world.

The fleet had divided in two on this voyage, with another of the royal eunuchs, Yang Min, visiting the western Indian kingdom of Bengal (modern Bangladesh). The king of Bengal gave Yang Min an exotic gift for the Chinese emperor: a giraffe. For the Chinese who had never seen such a creature, the giraffe was mistaken for the mythical beast qilin 麒麟, a form of dragon known to other east Asian cultures (kirin in Japanese, girin 기린 in Korean). Zheng He’s portion of the fleet traveled as far south as Mogadishu in what is now Somalia before returning to Nanjing in the summer of 1415.

The next year a major engineering project that would lead to the end of the Ming voyages was completed. The Grand Canal 大运河, which extended from Hongzhou southwest of Shanghai to Peking (modern Beijing), a distance of nearly 1,800 kilometers, was repaired. This canal
had been completed in the sixth century (Sui dynasty, 581–618 CE) but had fallen into disrepair because of annual floods. Part of the Ming dynasty’s engineering projects included the repair of the canal.

**Fifth Voyage**

The Chinese emperor ordered Zheng He to embark on another voyage in late 1416; this voyage began in 1417 when the winds became favorable. Much as the fourth voyage had progressed, the fifth voyage of the Ming fleet visited the usual ports in southeast Asia before continuing to the Maldives Islands, Hormuz, Mogadishu, Kenya, and Aden. This expedition had diplomatic goals as well as trade, and in particular Zheng He was to establish better relations with the Muslims who ruled much of this part of the world. The fleet returned to China in 1419.

**Sixth Voyage**

The sixth expedition was the shortest for Zheng He, who left with the fleet in early 1421 but returned with a part of it later that year. The rest of the fleet continued to Hormuz, east Africa, and ports on the Arabian Peninsula under the command of another of the court eunuchs. The longer voyage returned foreign diplomats to their home countries before it returned to China in 1422.

**Seventh and Final Voyage**

The final voyage of the Ming fleet was to be the grandest; some accounts claim that more than three hundred ships sailed. The fleet had been in its home waters for more than six years before departing China in late 1430 or early 1431. Nevertheless, Zheng He visited the usual ports of Champa, Java, Palembang on Sumatra, Malacca, Ceylon, and Calicut, and one part of the fleet went on to Hormuz and other places on the Arabian Peninsula. After the fleet joined up at Calicut during its return voyage, Zheng He died while the fleet was at sea.

The end of Ming exploration came with the death of Emperor Zhu Di and the ascent of his grandson Zhu Zhanji. Zhu Zhanji’s views of the outside world were more typical of leaders other than Zhu Di, and China returned to its isolation. The ships of the Ming fleet fell into disrepair. The Ming Maritime Expeditions had greatly expanded the range of China’s tributary states, but the end of the expeditions would eventually reduce the influence of China in the vicinity of the Indian Ocean littoral (coastal region).

**Further Reading**

The archives of the Ming and Qing, probably fifteen to twenty million items, offer an invaluable source of information about China’s final two dynasties. Nearly all documents in all collections have been sorted and catalogued. Most are housed in Beijing or Taipei, Taiwan, a number in other Chinese localities, fewer overseas—and some are available online.

The Ming-Qing Archives, a world-class cultural property, are a valuable inheritance from China’s last two dynasties, the Ming (1368–1643) and the Qing (1644–1912). Scattered across several Chinese-language areas, the small number of Ming survivals and the large number of Qing survivals are found principally in Beijing and Taipei, Taiwan, but also in local installations all across the country. Smaller holdings exist overseas, principally in Japan, the United States, Great Britain, and Russia. These archives are of vast size, estimated to number 15–20 million items, with new discoveries coming to light from time to time. The Ming portion is small, possibly seven thousand items, while the remainder derive from the Qing. They constitute one of the largest premodern archives in the world.

The Ming holdings differ significantly from the Qing in that they offer a range of topics, variety of languages (Manchu, Mongolian, Tibetan, Uygur, and others, in addition to Chinese), and sufficient serial runs to allow serious research. Most items are paper documents, many on rag-content paper so acid-free that it holds up after hundreds of years. A few were written on fine, patterned silk and sometimes wrapped in envelopes of silk glued to paper. Some items are wooden: audience tallies (green-headed sticks) that allowed a man into the imperial presence for a formal audience, wooden boxes for dispatching memorials (provincial reports), and boards covered in expensive silk to safeguard important imperial edicts in transit. Some documents have great beauty, decorated with borders of the imperial dragon motifs or embroidered on fine silk woven with imperial symbols such as the five-clawed dragon and the dragon’s symbols of clouds, waves, and fiery pearls. Reports destined for the emperor’s eyes bore clear, well-formed characters, but file copies were often scribbled in scrawls now difficult to decipher. Although most documents arrived on paper of a nondescript buff color, auspicious news often received the special treatment of a yellow background (yellow being the imperial color), and funeral matters were inscribed on stark white.

For the most part these were government, not private or commercial, documents. Their topics reflect government concerns, but much was covered under that rubric. Narratives of war and rebellion can be researched in the meticulous detail that their original authors used to plot military campaigns from grand strategy and troop deployments down to purchases of transport camels and carts, with food provisions calculated for both the army’s “big eaters” and those of normal size and appetites. Political life from court to county may be traced here. The archives preserve evidence of official interest in the civil service examinations, thousands of which survive, as well as records of imperial audiences, promotions, demotions,
Ming-Qing Archives

N

Míng-Qīng dàngʼànguǎn

punishments, and retirements. The files bring to life court
cases of the dispossessed, the down-and-out, the landless, and the uneducated. It is possible to examine the
economy through reports on taxation, customs dues,
harvests, and weather all across the realm. The purely
chronological assemblages of memorials were found so
unwieldy that they could not be retained in that order
and instead in Beijing today are filed in eighteen principal
and more than a hundred subcategories, the eighteen being Domestic Administration, Military Affairs, Finance,
Agriculture, Industry, Law, Foreign Relations, Natural
Phenomena, Imperialist Aggression against China, Water Conservancy, Popular Movements, Minority Peoples,
Literary and Cultural Matters, Communications, Commercial Activities, Public Works, Religion, and a final capacious category for everything else, Miscellaneous; the
Taibei palace memorial holdings are filed chronologically
but indexed under 80 subject-headings. These categories
will supply a clue to the research munificence of these
documents, which led one enthusiast to exclaim: “There
is nothing [these archives] do not have!”

Archives Not Complete
Nonetheless, these government archives lack a great deal,
most of which cannot be located elsewhere in China. First,
China’s earlier archives have not survived well. Original
government documents from before the Ming dynasty
are rare, but many were copied in full or excerpted for historical writing, and new finds occasionally turn up, especially in ancient tomb burials and the dry desert climate
of China’s west. Fire, from both the lanterns used to read
the documents at night and the end-of-dynasty warfare,
was an ever-present threat. To avoid conflagration, one
ancient archive was built with a surrounding moat, and
the tax records for the entire Ming dynasty were housed
on islands in a Nanjing lake. But such extreme precautions
failed to save these holdings, and nothing now remains of
either one. Insects were another archival scourge. Carelessness, lack of funds, and purposeful destruction of evidence have also resulted in the loss of materials. The Ming
dynasty had a copying program for a small number of its
documents, and this continued after the Ming fall. The
major Qing precautionary method for dealing with possible losses took shape during the eighteenth century and

N

明清档案馆

1495

relied on a massive copying program for selected innercourt items, first undertaken every five years and later every three. As a result, two, three, and sometimes as many
as five or even six copies of certain Grand Council record
books now repose in the archives.
Second, private writings, such as personal diaries, letters, and family records, have not survived well and generally have not found their way into archival installations,
although the Confucian family archives, which stretch
back nearly a millennium, are an exception. Prosperous
families frequently published their genealogies, many of
which can now be tracked through a modern reprint program. Another recent genealogical project scoured Taiwan for family records such as land and other commercial
contracts, photographed them, and deposited six copies
at various sites on Taiwan and in the west.
The hundreds of local archives in China are not known
to contain any Ming documents, but three have fine Qing
survivals reaching back to the seventeenth century. More
commonly, survivals date from after the middle of the
nineteenth century, but most local archives have no materials before the Republican era beginning in 1912. These
may exhibit some variations in file categories, but in theory the China mainland local archives follow a recentlyimposed universal plan.
Little is known about how the Ming archives were
classified, stored, and retrieved, although a few findinglists (inventories) and one detailed history of their
island-housed tax records exist (Houhu zhi). Much more
is known about the Qing because several finding-lists as
well as rules and descriptions have come down to us. Most
of the Qing central government archives were divided
between the old outer-court (waichao) types of materials,
which continued in use from the Ming, and inner-court
(neiting) documents, chiefly those of the Grand Council.
There were finding-lists for portions of these holdings.
The Grand Secretariat kept a log of incoming reports and
court responses known as “The Register of Silken [Imperial] Words” (Silun bu), silk being a commodity of great
value and beauty anciently associated with the emperor.
The Grand Council’s principal document register was
known as “The Register of [Matters] As They Came to
Hand” (Suishou dengji) and logged both incoming and
outgoing documents. Both lists were written up on a daily
basis, so the resulting order was chronological and formed
an index to the full-text copies of the documents, most

© 2009 by Berkshire Publishing Group LLC


of which (with a few exceptions, for military campaigns or other important subjects, for instance) were also filed chronologically. In addition to incoming reports and court responses recorded directly on the reports, there were record books of copied documents, some arranged according to type of document—a record of high-level deliberations, Yifu dang, for example—and others by subject (chiefly military campaigns). Lest this description create an aura of thorough and orderly competence, however, a reminder of the incipient chaos that prevailed in some quarters exists in the form of an eighteenth-century observation of the situation in one of the outer-court storage vaults: “One could reach one’s arm into the dust at random,” the observer wrote, “and pull out a treasure.”

Finding-List Centers

In recent years large finding-list centers (Quanguo lishi dang’an ziliao mulu zhongxin) have been developed for some holdings. Three, for instance, are concerned with what are known as “Historical Archives” (lishi dang’an), that is, those before 1949: Ming-Qing (1368–1912), the Republic (1912–1949), and the history of the Communist Revolution (up to only 1949). So far the Ming-Qing list seems to be the most advanced and when completed will provide a finding-list for both central and local government files. Uniform file categories and other consistent methods of archiving will assist this project. At present the Ming-Qing finding-list appears to be available only on-site in China. Some other finding-lists are available both online and on-site, with indexes of both open and closed files at fond, case, and document level. Some discrepancies have been found between the online and in-situ versions.

Missionary Education ▶
Although their presence in China stretched back many centuries, the Christian missionaries’ most productive period in the country lasted from the early nineteenth to the twentieth century. Missionaries were often the target of political and societal backlash, and their efforts at reform eventually shifted focus from evangelism to education.

Christian missionaries came to China as early as the eighth century, but the first extended presence there for the purpose of spreading Christianity on a permanent basis did not come until the so-called Age of Discovery, when European nations sought to establish footholds in North America, Africa, South Asia, and East Asia. The first Europeans to travel to China by sea were the Portuguese in the early sixteenth century. In 1541, the Spanish Jesuit priest Francis Xavier (1506–1552) was sent to spread Christianity to Asia. He was followed later in that century by more Jesuits, including Matteo Ricci (1552–1610), the best-known Christian missionary to China from the sixteenth century, but other than maintaining a Christian presence, no substantial progress in spreading Christianity was made because of the competition between Jesuits, Franciscans, and Dominicans. By the early eighteenth century, Christian missionaries were banned from China.
Nineteenth-Century Uprisings

Protestant missionaries arrived in China in the early nineteenth century, and their first efforts at education came not to the Chinese, but to each other. Unlike the Catholic missionaries, who had been able to establish themselves because of their ability to learn the Chinese language, but who did not try to pass on their knowledge to future generations of missionaries, the Protestants not only learned Chinese for themselves but assembled dictionaries and basic grammar texts for their successors.

Although China had made diplomatic inroads to Malacca in the fifteenth century, by the late 1700s it was under Dutch control. The Christian missionaries worked with Chinese immigrants and workers in Malacca. One of the earliest missionary schools for Chinese was established in Malacca, where William Milne (1785–1822) taught Chinese converts and assisted Robert Morrison (1782–1834) with his translation of the Bible into Chinese.

The efforts of Christian missionaries were undercut by a general antiforeigner sentiment by the Chinese government. Much of the antagonism stemmed from the unequal treaties that opened certain Chinese ports to the Europeans and Americans to facilitate trade in favor of the Westerners. The treaty ports were forced upon China by the Europeans in the aftermath of the First Opium War (1839–1842), which was waged by Great Britain against China in order to preserve opium trade with the Chinese. (China had tried to ban the import of opium because of the damage it was doing to the health of those Chinese who used it.) These feelings were aggravated in Chinese society by the missionaries’ belief that they, instead of the Chinese elite, held the keys to salvation and stability. Educated Westerners, including missionaries, saw the Chinese as a materialistic culture that needed to be reformed; the Chinese saw the missionaries, whose presence was more powerfully felt after the Second Opium War (1856–1860), as simply another aspect of foreign intervention. This was reinforced by the Taiping Rebellion of 1850–1864, which was rooted in an extremist ideology that combined Christian belief with pre-Confucian utopian ideals; it resulted in the deaths of between 20 and 30 million Chinese.

During the Taiping Rebellion, Hong Xiuquan, a village teacher turned self-proclaimed “king” of recruited militants, attempted forcefully to reform Chinese society along Western cultural lines. The huge number of deaths he and his followers caused led the Chinese government to suppress Christian missionary efforts. After the rebellion the most successful missionaries were the French Roman Catholic missionaries. France was not considered by the Chinese government’s foreign ministry to be as intrusive as other European nations, and agreements were made with France that permitted missionary activities as long as they...
did not interfere with Chinese society; the French were charged with restricting their own missionaries in this regard. Missionaries were permitted to convert the Chinese to Christianity, but the names of those converted had to be reported to Chinese authorities. Christianity in China during the 1860s was tolerated but not encouraged.

In the late 1860s, Chinese sentiments against Christians were inflamed by rumors that Chinese children were being killed by the Europeans to make medicine. These rumors incited uprisings in Yangzhou in 1868. Similar rumors led to the Tianjin Massacre of 1870, which resulted in the deaths of twenty-one foreign missionaries and dozens of Chinese Christians and led to a general decline in relations between the Chinese government and Christian missionaries.

The antiforeigner campaign of the Society of the Righteous and Harmonious Fists, known to Westerners as the Boxer Rebellion (1899–1900), was an attempt by reactionary Chinese to expel foreigners and restore the emperor, as had been done in Japan during the Meiji Restoration of 1868. The Boxers’ siege of foreign legations (including the embassies of Russia, France, Japan, the United States, Great Britain, Germany, Italy, and Austria-Hungary) was defeated by an international force, and these eight nations forced the resulting Boxer Protocol on the Chinese government, demanding reparations of 450 million taels of silver (one tael of silver this represented would have a value in 1868 of nearly $33 billion. The short-term result of the Boxer Protocol was a further weakening of control by the Chinese imperial government; a long-term result was the recognition by the Chinese that this government could not serve their needs, which set the stage for rebellion in the form of Chinese nationalism.

While the Boxer Rebellion was not antimissionary as much it was anti-foreigner, it did result in the deaths of nearly 19,000 Chinese Christians and over 200 Catholic and Protestant missionaries.

**Twentieth-Century Missions**

The activities of Christian missionaries in China increased in the early twentieth century, due in part to the rise in Chinese nationalism led by Sun Yat-sen, who had accepted Christianity while studying in Hawaii. In particular, efforts were made by Protestant missionaries to spread their work into China’s interior. Although much of the education was provided through preaching in English and conducting meetings among converts, formal schools were being established to meet both the physical and spiritual needs of the Chinese Christians. Reviews of mission reports indicate that prior to 1916 the primary emphasis was on the evangelical efforts of Western missionaries, but after that date the majority of reports dealt with formal schools for boys, girls, and the disabled. By 1921 the Interior China Mission headquartered in Kaifeng in Henan had established day schools and boarding schools for boys and girls at both primary and secondary school levels. These, in addition to the separate schools for Chinese men and women, had enrolled over a thousand students by that time.

There was conflict between Chinese schools and missionary schools in the early twentieth century. While Chinese schools taught a generally standard curriculum, the schools run by Western missionaries focused on Christian religious education. These missionary schools were seen as heterodox, or unconventional, by the Chinese elite, although many of them recognized the value of Western science, technology, and other ideas. The conflict between the two types of schools was largely one of misperception: Because Chinese schools that taught from classic Chinese writings focused on Daoist teaching of “the Way,” while the missionary schools taught a very different focus, the Western schools were seen as a threat to the stability of society. Ironically, it was the establishment of Chinese universities, not missionary schools, that would lead to intellectual challenges to governmental authority.

Nevertheless, the efforts of missionary educators continued to expand into the interior of China until the factional fighting between the Nationalist government and warlords in the more remote areas made the missionary activities too dangerous. All Americans, including missionaries, were ordered by the United States consul to leave China in 1927. Although many Americans complied, others remained and were joined by even more missionaries. Viola Humphreys (1887–1939), who had spent seven years in Kaifeng in 1920s, returned to supervise missionary activities and schools there after she had attended college in Texas from 1928 to 1929. Her efforts included evangelism, schools for boys and girls, a kindergarten, and...
a Goodwill Center, as well as health care assistance for students in her schools from a Chinese physician. Zemma Hare (1893–1941), an American Southern Baptist active in Kaifeng, directed the Women’s Bible School there. The students at this school were adult Chinese women who had to read the Gospel of Mark in Chinese prior to admission. This encouraged development of literacy in a segment of Chinese society in which it had traditionally not been valued.

By the 1930s the Chinese government had established its own universities. Most of these national universities (guoli, 国立) were concentrated in the major city areas of Peking (Beijing, 北京), Shanghai (上海), Nanking (南京, 南京), and Canton (Guangzhou, 广州). The various missionary groups in China by this time had also established their own colleges, some of which were located in these regions, but many of the missionary colleges were located in more rural areas. The focus of education was also different: While the national universities were specialized, the missionary colleges were established along British and American models of the liberal arts college, and a large number of their graduates became teachers in other missionary schools.

As the international situation deteriorated in China with Japan’s invasion, conditions for foreigners in general, and missionaries in particular, deteriorated as well. The presence of foreign diplomats and clergy interfered with Japanese activities because these foreigners, under some degree of diplomatic protection, could serve as witnesses to the atrocities committed by the Japanese. One of the most heroic efforts of Western Christian missionaries in China was made by those who confronted the Japanese during their invasion and occupation of Nanking in 1937. During her second assignment to China, the American Wilhelmina Vautrin (1886–1941) founded Ginling College 金陵女子学院 in Nanking and worked with other Westerners to protect the citizens of that city. By establishing the Nanking Safety Zone 南京安全区, Vautrin and ten other Westerners provided an area of limited protection to the students in the college as well as hundreds of thousands of other Chinese.

The disruption caused by the war with Japan and the Chinese Civil War set back missionary efforts and education, and the victory of the Communists over the Nationalists further hurt Christian evangelism and education in China. The worst of this occurred during the Cultural Revolution (文化大革命, 1966–1976). Like the Boxer Rebellion, this was both an antiforeigner and anti-modern movement that sought to implement the teachings and political thought of Mao Zedong (毛泽东, 1893–1976) on society. The end of the Cultural Revolution permitted a return to efforts by Christian and Islamic missionaries to bring religion and religious education to the People’s Republic of China.

Within ten years both religions were active again, but Chinese Christians had begun to see themselves in a very different way. They viewed the evangelism of the past as a form of colonialism, and felt that the leaders of the Western churches had treated Chinese converts as less than equal. The Chinese government has appeared to take a supportive role in permitting religious activities, but this has, in fact, led to a greater separation from the Vatican and from Protestant leaders and doctrine in the West. It
is particularly difficult for Chinese Catholics because of the Chinese government’s one-child policy, which is at odds with the Catholic prohibition on birth control and abortion.

Since Western missionaries began bringing religion and Western-style education to China in the early nineteenth century, China has changed drastically. Interestingly, many of the innovations brought by Christians, such as educating women and the physically handicapped and the liberal arts education, are now accepted as aspects of social justice under China’s modern socialist system. Missionary schools had only worked with physically disabled students, but China now claims that it also works with “intellectually disabled” students as well (although only about 1 percent of disabled students there receive special education). The focus of Christian (and Muslim) missionaries in China today is evangelism; over one hundred of them were expelled before the Beijing Olympics in 2008.

Mobile Communications

Yídòng méi tī chuán bō de fā zhǎn
移动媒体传播的发展

Mobile phones are easily accessible and wildly popular in China. More than half the population uses mobile phones. The technology is improving and the telecommunications industry is growing to better serve the demands of China’s enthusiastic mobile phone users.

In Guangzhou on 21 November 1987, a young man named Xu Feng became the first mobile (cell) phone user in China when he bought an NEC simulative mobile phone for ¥20,000 (about $2,900). It did not take long after that for the popularity of mobile communications to soar in China.

The use of mobile phones in China exploded in the 1990s after Groupe Spécial Mobile, or Global System for Mobile communications (GSM), was introduced from Europe. GSM is the most popular standard for mobile phone use in the world. China is the largest GSM market in the world.

Millions of Users

China is the world’s largest mobile phone market, judging by the sheer number of users. By August 2008, according to the Ministry of Industry and Information Technology, the number of mobile phone subscribers in China had reached more than 616 million, nearly half the population. China ranked low, however, in terms of the ratio of users. In 2008 there were 411.5 subscribers per 1,000 people, a ranking of 121 of 222 countries surveyed. By comparison the United States had 890.3 subscribers per 1,000 people (ranked 68th); Taiwan, 1,060.3 (30th); Hong Kong, 1,503.1 (5th); and Macao, 1,723.7 (1st).

By June 2008, there were 253 million Internet users) in China. The number of people surfing the Internet with mobile phones had reached 73 million, about 29 percent of all Internet users.

The cost of mobile phones and subscription rates are high in China, compared to the charges in Western countries. But the booming mobile market and the battle for market share has spurred aggressive price cutting by the country’s mobile operators.

Users’ Choices

China’s telecommunication enterprises provide the full range of services available in developed countries. Services include nationwide fixed-line telephone services; wireless application protocol (WAP) for mobile banking, stock trading, news, weather reports, and e-mail; and GSM and Code Division Multiple Access (CDMA) networks for data services for businesses, voice mail, call forwarding, call waiting, conference calls, Internet protocol telephony, multimedia message service (MMS), and short message service (SMS), also known as text messaging.

SMS is one of the most popular services among the Chinese people. During 2006 each mobile user in China sent an average of 967 text messages. Chinese mobile users sent more than 400 billion text messages between January and July 2008. Tianjin, a large city in northern coastal
China, launched the first Chinese-language mobile phone short message service in China in 1997. SMS and SMS-based information services began spreading rapidly after China Mobile, Ltd., a state-owned telecommunications enterprise, launched the Monternet Plan in November 2000. This was the first so-called mobile value-added service available in China. Monternet (Mobile+Internet) acts as a bridge between mobile devices and Internet-based and other digital information services.

SMS is popular in China because the number of Chinese mobile phone subscribers is large, the market for SMS services is well developed, and subscribers like to be able to obtain instant information at any place and at any time. In addition, SMS seems to fit in with the Chinese culture. Many Chinese of all ages are reluctant to leave voice messages but not text messages. And a new kind of popular literature has developed through SMS use. People are sharing gossip, news, views, and jokes (even political jokes) in ways unavailable before. The SMS and WAP lead to more freedom of expression in China, for it is impossible for government to control information that is conveyed almost instantly.

SMS also provides an economical way to communicate. The end-user price for sending and receiving a message is ¥0.10 (about 1.5 cents). A one-minute call costs ¥0.50 (about 8 cents) to ¥0.60 (about 9 cents), and the long distance charge for mobile service is ¥0.70 (about 10.5 cents) per minute.

Service Providers
A number of services providers have sprung up in recent year to serve China’s growing mobile and Internet communication needs. Following are brief profiles of some of the most important providers.

China Mobile Communications Company (China Mobile) is the world’s largest mobile phone company, by number of subscribers. The company had some 407 million GSM subscribers as of April 2008 and a 67 percent share of the Chinese mobile market. China Mobile is a state-owned enterprise established in 1997 as a spin-off from China Telecom, the largest fixed-line phone provider in China. China Mobile also owns Pakel in Pakistan and China Tietong, the third largest broadband Internet service provider in China. China Mobile was the first enterprise from mainland China to be included in the Dow Jones Sustainability Index.

China Unicom (Hong Kong), Ltd., better known as China Unicom, was incorporated in 2000 in Hong Kong. As of June 2008, it had 127.6 million GSM subscribers. China Unicom is one of the largest publicly owned telecommunications providers in China. Its stocks are traded on the Hong Kong, Shanghai, and New York stock exchanges.

In 2008 China Unicom merged with China Netcom Group Corporation (Hong Kong), Ltd., or China Netcom, a major provider serving northern China that held about 109 million fixed-line phone users and 23.3 million broadband subscribers. The new enterprise integrates wireless and fixed-line services.

China Unicom sold its CDMA service to China Telecommunications Corporation (China Telecom) for ¥110 billion (about $16 billion) in 2008. China Telecom has invested billions of yuan to upgrade its CDMA network.

Huawei Technologies Company, Ltd., and Zhong Xing Telecommunication Equipment Company, Ltd., (ZTE Corp.) are two of the major suppliers of telecommunications equipment and networks. Huawei provides next-generation telecommunications networks and serves thirty-five of the world’s top fifty operators. At the end of June 2008, Huawei had more than 87,000 employees, of whom 42 percent were dedicated to research and development. ZTE Corp. is one of the major equipment vendors for China Mobile’s TD-SCDMA network, a homegrown third-generation (3G) mobile phone standard. TD-SCDMA, or Time Division-Synchronous Code Division Multiple Access, is a 3G mobile telecommunications standard, being pursued and designed in China by the Chinese Academy of Telecommunications Technology. TD-SCDMA will soon be put into commercial use encouraged by the Chinese government.

Fifth Medium
In China the mobile phone is known as the fifth medium, following newspapers, radio, TV, and the Internet. In recent years China’s newspaper groups have set up SMS and MMS news services as an alternative way for traditional media to disseminate news. The China Women Daily was the first MMS newspaper in China. But SMS and MMS
newspapers have not been attracting new subscribers, and expenditures for these types of services are high for providers. Nevertheless, the mobile phone industry’s status continues to grow.

In 2002 the mobile phone SMS sector was even credited for saving the Chinese Internet. The three biggest portal websites in China were in danger of being removed from the NASDAQ, the largest U.S. stock market, because of slow business. Netease became the first profitable website in China with its network games and short message services. Shortly after, Sina, Sohu, Tom, and other websites were also able to generate high profits through short message value-added services. As a result, the Chinese value-added SMS market enjoyed five years of rapid development.

Now traditional advertisers flock to the mobile phone as the new medium. Third-generation audiences have become the target groups for advertising in recent years. The legality of sending advertisements to mobile subscribers has been questioned, however. It is seen as the equivalent of sending junk e-mails and junk mail. If there is no solution for the issue of developing legitimate and ethical mobile phone-based advertising approaches, the market development of the mobile phone as a new medium may be greatly restricted.

Rules and Regulations

As expected, the mobile communications industry in China is highly regulated. In addition to many rules enforced by minor state agencies and local bureaus, the two main acts that govern the industry are the Regulations of the People’s Republic of China on Telecommunications (telecommunication regulations) and the State Council’s Measures for Administration of Internet Information Services (administrative rules), both promulgated in 2000. These regulations are important for a number
of reasons besides stipulating fair business practices. They fulfill China's commitment to World Trade Organization guidelines for the telecommunications industry. They opened the way for direct foreign participation in the telecom sector, which before 2000 was forbidden to foreigners. They established that the market would be competitive (no more state-owned monopolies). And they promoted development, transparency, fairness, and impartiality in the marketplace.

**Future Communications**

The future of mobile communications in China, as in most of the rest of the world, seems to lie in the so-called third-generation mobile phone technology (3G), which operates on a different radio frequency than earlier networks did and provides improved voice clarity and greater access to global roaming between networks. Also, 3G can support applications that require extensive bandwidth, such as video, full Internet access, and video conferencing.

But 3G technology and licensing have been slow to arrive, so China has created a network based on its own technology called Time Division Synchronous Code Division Multiple Access (TD-SCDMA). While this new technology has potential, it is not yet fully developed or operational, unlike its foreign rivals WCDMA and CDMA2000. Because the government is aggressively promoting TD-SCDMA, operators in China have not been allowed to build WCDMA and CDMA2000 networks.

China Mobile has been under increasing pressure to embrace TD-SCDMA technology. The company has been criticized for not giving full support to the homegrown standard. Nevertheless, China Mobile has invested ¥14.6 billion (about $2.1 billion) to build a commercial trial network based on TD-SCDMA technology in eight cities. If the trial is successful, commercial applications would follow and give TD-SCDMA the upper hand in China, and possibly in other parts of the world. Once 3G phones are seen as being multimedia and networking devices as much as they are telephony tools, it is likely that their many advanced uses will proliferate and usership will increase.

The initial investments in new technologies are huge, but the prospect is exciting to China's telecommunication industry and its millions of subscribers. Mobile communications, which have become a fundamental part of Chinese life, will most likely become even more essential.

The Mogao Caves, dug in sandstone cliffs outside Dunhuang from 366 CE to the Yuan dynasty (1279–1368), contain more than two thousand statues and more than 45,000 square meters of murals. Texts discovered in 1900 provide a rare source for the study of Chinese religion, literature, art, history, and daily life.

The Mogao Caves, 492 of which are preserved, were dug in the sandstone cliffs outside the city of Dunhuang 敦煌 in Gansu Province, from 366 CE to the Yuan dynasty (1279–1368). Dunhuang, an oasis in a desert where travelers along the Silk Roads stopped to rest and resupply, served as a workshop where for more than a thousand years Chinese and central Asian arts mixed. Some of the most impressive creations in Chinese art history, such as the mural depicting the Flying Apsara 飞天 Musicians, were born in the caves. Of the more than two thousand statues and more than 45,000 square meters of murals, most depict Buddhist history, legends, and ways of life as China interacted via the Silk Roads with central Asia and beyond. Today Dunhuang is an important center for the study of Buddhism, Buddhist arts, and the Silk Roads.

Thousand Buddha Cliff outside of Nanjing, Jiangsu Province. This sacred place dates back to the fifth century, although many additions have been made over the centuries. PHOTO BY JOAN LEBOLD COHEN.
In 1900 Wang Yuanlu (d. 1931), a Daoist monk, discovered in a sealed cave more than fifty thousand pieces of paintings and handwritten texts dating from the fourth to the fourteenth centuries. The texts were written mainly in Chinese or Tibetan, but some were written in Sanskrit and a half dozen other languages. In addition to a large number of works on Daoism, Buddhism, and Confucianism, the texts contain accounting books, historical records, court records, literary works, and works on geography, astrology, mathematics, medicine, and so on. The texts, encyclopedic in their scope, provide a rare source for the study of Chinese religion, literature, art, history, and daily life.

As part of Wang’s efforts to raise money to rebuild a nearby monastery, which he renamed “Sanqinggong” (三清宮 the Daoist Trinity Palace), Wang sold some of his discoveries to smugglers from Britain, the United States, Japan, France, and Russia. Between 1907 and 1925 Dunhuang witnessed an exodus of some of its most valued relics, which are today held in Britain, India, Japan, the United States, France, Russia, Denmark, Sweden, Finland, Germany, Turkey, and Korea. The Museum of Dunhuang Hidden Library, located in Sanqinggong, opened in 2000 to tell the story of the Dunhuang treasures. The Mogao Caves are a United Nations Educational, Scientific, and Cultural (UNESCO) World Natural and Cultural Heritage Site.

Mongolia has long been a bone of contention between Russia and China. Russia historically has seen Mongolia as a buffer state, whereas China historically has seen Mongolia as part of China. Although Mongolia has achieved varying levels of independence since 1911, subsequent political instability and war in both China and Russia—and Mongolia’s current geopolitical position between both countries—complicates relations among all three.

When Russia pushed into the Far East and China pushed its domination north of the Great Wall in the early twentieth century, Mongolia became an arena of the “Great Game”—the struggle for empire between China and Russia. Mongolia’s leader at the time, the Jebtsundamba Khutukhtu (holy venerable lord) Khutukhtu (1874–1924), called Mongolia’s geopolitical position a “critical condition, like piled up eggs, in the midst of neighboring nations.”

Russia historically has regarded Mongolia as a buffer state, whereas China historically has regarded Mongolia as part of China. But after the Manchu Qing dynasty (1644–1912) fell, Mongolia asserted—and has since preserved—its independence as a nation in the midst of two great powers. Russia’s policy initially strove to preserve Mongolian autonomy, but it did not support Mongolian independence in order to maintain China-Russia relations and not alarm Japan. After 1917 the Soviet Union eventually did support Mongolian independence but was not firm in that support. China, however, persistently tried to absorb Mongolia into the new Chinese nation.

1911 Revolution and Mongolian Independence

After the Chinese revolution in October 1911, Mongolia declared independence in December 1911 and proclaimed the Jebtsundamba Khutukhtu leader of the independent Mongolian nation. Mongolia had enjoyed a special relationship with the Manchu Qing dynasty (1644–1912) court, and Mongolians believed that Mongolia was not an integral part of China. China maintained that Mongolia was indeed an integral part of the country but did not have the military strength to force the integration of Mongolia into the new Chinese republic.

Russia’s czarist government also was debating policy toward Mongolia. Russia had not recognized the independence of Mongolia but was providing Urga—as the Mongolian capital, Ulaanbaatar, then was called—military, political, and financial support. In Japanese-Russian negotiations as early as 1907 Russia considered partitioning Mongolia into inner and outer zones, with Japanese and Russian spheres of influence, respectively.

During the period from 1911 to 1915 Mongolia, Russia, and China held convoluted negotiations, including

Menggu-Zhongguo-Eluosi de waijiao guanxi
蒙古, 中国, 俄罗斯的外交关系
secret bilateral talks, and did much military posturing, which in June 1915 resulted in a tripartite agreement that gave the broadest possible autonomy for outer Mongolia and would make possible its eventual total independence from China. The agreement included provisions on taxes, trade, and other matters but no boundary agreement, but a neutral zone was established between outer and inner Mongolia.

China rejected the agreement after the 1917 Russian revolution, and under pressure from China the Jebtsundamba Khutukhtu in November 1919 petitioned for the abolition of Mongolia’s autonomy, a petition with which China gladly complied. But the reassertion of Chinese control of Mongolia did not last long: Mongolia became a battlefield during the Russian civil war, and the White Russians (anti-Bolsheviks) drove the Chinese from Urga in 1921, only to be defeated themselves by the Bolsheviks.

Mongolian People’s Republic
With the blessings of the Jebtsundamba Khutukhtu and the Soviet Union, Mongolian revolutionaries established a Marxist regime in Urga in 1921. But the Soviet Union, like czarist Russia, continued to view Mongolia as a bargaining chip in its dealings with China. The Soviet Union in May 1924 recognized China’s “full sovereignty” over outer Mongolia. A month later, however, after the death of the Jebtsundamba Khutukhtu, Mongolia declared
its independence as the Mongolian People’s Republic (MPR). China’s own internal problems kept it from reasserting control over Mongolia; the most that China could do was protest the Soviet-Mongolian agreements.

At the Yalta Conference two decades later Mongolian independence was bolstered when the Allied powers agreed that the status quo in Mongolia should be preserved after the war. After a plebiscite (a vote by which the people of a country express an opinion for or against a proposal especially on a choice of government or ruler) in Mongolia overwhelmingly favored independence, the Chinese Nationalist government grudgingly recognized Mongolia’s independence in 1946.

**Quest for Influence**

China’s Communists also were reluctant to recognize Mongolia’s independence and harbored irredentist sentiments. (Irredentism is political or state policy directed toward reincorporating a territory that was historically or ethnically related to that state but which has fallen under the control of another.) Even before the founding of the People’s Republic of China (PRC), in a January–February 1949 meeting with Soviet leader Joseph Stalin’s personal liaison to the Chinese Communists, Chinese Communist Party leader Mao Zedong (1893–1976) raised the question of the Soviet Union’s attitude concerning the unification of outer and inner Mongolia.

Mao again raised the question with Stalin directly while in Moscow in February 1950. Mao expressed his desire for the eventual “reunion” of Mongolia with China, but he did not let his irredentist dreams prevent the conclusion of a Sino-Soviet treaty. The Soviet Union and MPR were uneasy about China’s ambitions in Mongolia and demanded that China acknowledge Mongolia’s independence.

In spite of that declaration, in October 1954 China raised the question again during the first visit Soviet leader Nikita Khrushchev (1894–1971) made to China after the death of Stalin. Chinese premier Zhou Enlai (1898–1976), under great pressure from Mao, reluctantly raised the issue with Khrushchev. According to Khrushchev’s memoirs, he declined to speak for Mongolia but did not voice strong opposition. Although the Soviet Union may have refused to reconsider the status of the MPR, it did acquiesce to China’s assuming a more dominant role in Mongolia.

Soviet complacency over China’s ambitions in Mongolia soon turned to alarm as Sino-Soviet relations deteriorated in the late 1950s. The Soviet Union responded to the Chinese challenge, and Mongolia was caught in the middle of the Soviet-Chinese dispute. Mongolia’s initial wish was to remain neutral, and one official said the Soviet-Chinese dispute would not affect Mongolia’s relations with China or the Soviet Union. But Mongolia’s precarious geopolitical situation made it impossible to remain neutral for long. Mongolia took a pro-Soviet position after the open split between China and the Soviet Union occurred at the Twenty-second Communist Party of the Soviet Union (CPSU) Congress in October 1961. In June 1962 Mongolia became the first Asian state to become a full member of the Council on Mutual Economic Assistance (COMECON). This move was a clear indication that Mongolia would closely cooperate with the Soviet Union to the exclusion of China.

China, in its attempt to gain influence in Ulaanbaatar, appealed to Mongolian nationalism. In 1962, during the commemoration of the eight hundredth anniversary of Mongolian conqueror Chinggis (also spelled Genghis) Khan’s birth, Mongolia dedicated a statue at a location believed to have been his birthplace. China also celebrated the birthday and supported Mongolia’s festivities. China, with both racist and nationalistic overtones, characterized Chinggis Khan as a positive “cultural force.” The Soviets Union, not surprisingly, criticized the celebrations, characterizing Chinggis Khan as a reactionary “who had overrun, looted, and burned most of what was then Russia” and saying that his “bloody invasions” were a “great historical tragedy” (Hersch 1963, 1).

**Current Situation**

On 16 December 1962 China announced that Mongolian leader Tsedenbal (1916–1991) would come to Beijing to sign a treaty to settle the boundary. After demarcating the boundary, a treaty was signed in Ulaanbaatar on 2 July 1964. The agreement closed a long chapter in Mongolian-Chinese relations. But in spite of the treaty China and Mongolia remain sensitive about their historical relationship.
Mongolia-China-Russia relations entered a new period in 1991 with the collapse of the Soviet Union. Mongolia conducted a peaceful transition to democracy and a multiparty political system. This newfound independence re-invigorated Mongolian nationalism. China and Russia still control parts of historical Mongolia, and pan-Mongolian sentiments are somewhat alarming. China is sensitive to the growing popular influence of Mongolia on its Inner Mongolian Autonomous Region and represses any expression of Mongolian nationalism among Chinese Mongols.

Geopolitics remains a concern. Russia needs Mongolia to act as a buffer to shield it from China as China becomes an economic and military power. And the legacy of the Chinese empire apparently lingers in the minds of some Chinese: China's State Security Ministry in 1992 revived the specter of Chinese irredentism when it said: “As of now, the Mongolian region comprises three parts that belong to three countries”—the Russian regions of Tuva and Buryatia, Mongolia, and the Inner Mongolian Autonomous Region—but “the Mongolian region has from ancient times been Chinese territory” (China stakes a claim to all of the Mongolias, 1992).

Monument to the People’s Heroes

Rénmín Yìngxióng Jìniànbèi

The Monument to the People’s Heroes is dedicated to those who helped transform post-Imperialist China. Its placement in Tiananmen Square along the north-south axis of Beijing shattered the traditional cosmological significance of that axis as the orientation used to site the grand and imposing imperial places—while asserting a symbolic transition to China as a modern, socialist state.

With its imposing monuments, striking vastness, and elegiac history, Tiananmen Square in Beijing is an unrivaled iconic space in the People’s Republic of China (PRC). The square’s makeover, from a relic of the imperial domain with associated cosmic qualities into a public arena celebrating socialist aspirations, took place over the past half century with the incremental insertion of symbolic architectural statements.

Key among these statements were the creation and placement of the Monument to the People’s Heroes during the first decade after the establishment of the PRC in 1949. The monument was designed by renowned architect Liang Sicheng in collaboration with his wife, Lin Huiyin, who debated with others from 1951 onward as to whether the monument should be like a pagoda or a pavilion. Ultimately the consensus was to construct an imposing spire somewhat similar to a traditional stone memorial stele. The obelisk was completed in 1958 atop a plinth upon which marble relief panels narrate the revolutionary struggle of the Chinese people during the nineteenth and twentieth centuries, from the First Opium War through the civil war. In chronological order in a clockwise direction from the east side, the panels depict the burning of opium during the Opium War (1939–1942); the Jintian village uprising during the Taiping Rebellion in 1851; the Wuchang Uprising during the 1911 revolution; the May Fourth Movement in 1919; the May Thirtieth Movement in 1925; the Nanchang Uprising in 1927; the War of Resistance against Japan from 1937 to 1945; and the successful crossing of the Yangzi (Chang) River in 1949 that presaged the liberation of Nanjing. In addition, two panels present words drafted by Chinese Communist Party (CCP) leader Mao Zedong with calligraphy by Premier Zhou Enlai: “Eternal glory to the Heroes of the People who laid down their lives in the People’s War of Liberation and the People’s Revolution in the past three years! Eternal glory to the Heroes of the People who laid down their lives in the People’s War of Liberation and the People’s Revolution in the past thirty years! Eternal glory to the Heroes of the People who, from 1840 laid down their lives in the many struggles against domestic and foreign enemies and for national independence and the freedom and well-being of the people!”

Unlike the surrounding imposing buildings flanking the square, the 37-meter-tall granite obelisk, with an overall footprint of 3,000 square meters, many people felt, disrupted the cosmological axial design of imperial times. According to the art historian Wu Hung, the specific placement of the obelisk was “an attempt to put a punctuation mark in the flow of history, to separate the past from the present” (Wu 2005). The construction

© 2009 by Berkshire Publishing Group LLC
of Chairman Mao’s mausoleum just to the south of the Monument to the People’s Heroes in the autumn of 1976 irretrievably separated any lingering significance of the historic north-south longitudinal axis based upon gates and palaces of the imperial past.

Over the past thirty years, since the death of Zhou Enlai in 1976, the obelisk has become a site of protest in addition to one of memory. In May and June 1989, sparked by the death of former CCP Secretary General Hu Yaobang, TV viewers worldwide witnessed the emergence of a democracy movement as well as its subsequent suppression in Tiananmen Square in the shadow of the Monument to the People’s Heroes.

The Moso is a minority ethnic group in southwest China, officially classified, against their will, as a subgroup of the Naxi people. Women, not men, are at the center of Moso culture. The Moso practice a unique visiting system of sexual union in which conjugal partners do not marry or share the same household, and household organization is matrilineal.

The Moso, also known as the Mosuo, Na, or Naze, are a Chinese minority ethnic group living on the border of the southwestern provinces of Yunnan and Sichuan. No census data of the Moso are published, as they are officially classified as a subgroup of the Naxi, a large ethnic minority in China. The Moso population, estimated to be around forty thousand, live in a microclimate suitable for farming, have long since developed irrigation techniques to benefit agriculture and fishing techniques; the Moso were a relatively self-sufficient population for until recent modern times.

The Moso language belongs to the Yi branch of the Tibeto-Burman subfamily of the Sino-Tibetan family. It is a spoken language without written form. The Moso have their own religion, the Ddaba religion, which is a combination of nature worship, spirit worship, and ancestral worship. Since the mid-sixteenth century, however, the religious life of the Moso has been strongly influenced by Tibetan Buddhism.

Sexual and Reproductive Institutions

The most conspicuous feature of Moso culture is tises, literally meaning "walking back and forth," a visiting system...
that is the normal sexual and reproductive institution. Even though marriage was introduced to Moso society in the thirteenth century, it has not been adopted by most of the people. Up to recent decades, tisese differed from marriage in that it was noncontractual (no binding force to maintain the relationship), nonobligatory (no obligation between the two partners), and nonexclusive (no requirement to be loyal). The common practice was for each of the two partners to work and eat in their matrilineal households respectively. The man visited the woman, stayed with her overnight, and went back to his own household the next morning. The only prerequisite for a tisese relationship was a mutual agreement between the man and the woman to allow sexual access to each other. Children born to such a union belong to the household in which they were born, usually the mother’s household. As Moso culture has been changing rapidly in recent decades, tisese has been losing the nonexclusive and nonobligatory features.

**Kinship and Family**

Women, and not men, are the center of Moso culture. The Moso practice matrilineal descent (tracing parent-child links only through the mother’s line). In their unique kinship system, there are neither terms to address any relatives on the father’s side, nor any terms for “in-law” relatives. There is only one term for each gender in each upper generation (namely, one term for mother and all her sisters, one term for all grandmother’s brothers and her male maternal cousins, etc.). The father, if known, is usually addressed with the same term as the mother’s brother. A man’s responsibility for the next generation is to help with raising his sisters’ children. The children whom he begot are the responsibility of their mother’s brothers.

As both cause and effect of tisese, most Moso live in households formed by three to four generations of blood relatives related through the mother. Members of such a matrilineal grand household include the mother’s mother and her siblings, as well as the children of the mother’s mother’s sisters; the mother and her siblings, as well as the children of her sisters; and the mother’s own children. Thus, in contrast to most other societies, the number and gender of children of cohabitating sisters is of primary importance for the Moso, not the number and gender of offspring of a particular couple. Special attention is given to the first girl born in each generation, as it is she who will ensure the continuation of the household. Because there are no married couples in a typical Moso household, the nuclear family is not a norm among the Moso.

Mount Emei
Éméi Shān

Mount Emei (Emei Shan) is considered to be the birthplace of Buddhism in China, with temples and monasteries dating from the late Han dynasty (206 BCE–220 CE). Twenty are still in operation today, helping to make the mountain one of China’s most popular tourist attractions. The area became a UNESCO World Heritage Site in 1996.

Mount Emei is the highest and most important of the four sacred Buddhist mountains of China and has attracted pilgrims and visitors for the last two thousand years. Located in Sichuan Province about 135 kilometers south of the provincial capital Chengdu, Mount Emei covers an area of more than 300 square kilometers and incorporates three mountains, the highest of which is Wanfoding (Peak of Ten Thousand Buddhas), reaching 3,099 meters.

The word Emei means “high eyebrows” and alludes to the resemblance between two facing peaks and the refined features of a traditional Chinese beauty. To the north and east the mountains rise steeply from the Sichuan basin and cover four climatic zones, from subtropical to subalpine, with snow-covered peaks in winter. The craggy southern cliffs are crossed by narrow canyons in all directions. Mount Emei has an impressive diversity of flora and fauna. More than three thousand species of plants have been identified, of which more than one hundred are rare herbs and medical plants endemic to the mountains. Birds and other wildlife are almost as abundant; scores of bird species are found only at Mount Emei, while the most visible representatives of animal life are the ubiquitous monkeys, which have grown accustomed to the crowds of people visiting the area.

Experts believe that the first Buddhist temples in China were located at Mount Emei. The earliest temples and monasteries were built during the later Han dynasty (206 BCE–220 CE) in honor of the bodhisattva (a being that refrains from entering nirvana in order to save others and is worshipped as a deity) Samantabhadra (Puxian in Chinese), who is usually depicted riding on a white elephant with six tusks. Of the more than 150 temples and monasteries constructed over the centuries, about twenty are operating today. Set on a slope at the foot of the mountains are the recently renovated four main halls of the Baoguo (preserve the country) temple, built between 1573 and 1619. The temple houses a 3.5-meter-high Buddha made of porcelain and dating to 1415 as well as seven 20-meter-high gilded Buddhas. About 1 kilometer farther west lies the Fuhu (hidden tiger) temple, which has a 7-meter-high red copper pagoda containing more than 4,700 images of Buddha.

Closer to the peak at 1,020 meters above sea level is the Wannian (ten thousand years) temple, which is the largest on Mount Emei and traces its history back to the fourth century. All wooden structures were destroyed in a fire in 1946, but the temple was rebuilt in 1953. An Indian-style brick hall constructed during the Ming dynasty (1368–1644) contains a 7.35-meter-high gilded statue of Samantabhadra sitting on a white elephant. The statue was cast during the Song dynasty (960–1279) and weighs 56 metric
tons. Both the Wannian temple and the Golden Peak at 3,077 meters above sea level can be reached by cable car. The Bright Hall at the Golden Peak, which was destroyed in a fire in 1972, was replaced by a new structure in 1990, and recently a new statue of a four-faced Samantabhadra sitting on four elephants has been erected in front of the hall. This 48-meter-high gilded bronze figure is situated at the top of a long staircase flanked by white elephants carrying gilded Buddhist symbols. In 1996 Mount Emei and the neighboring 71-meter-high Buddha at Leshan were added to the United Nations Educational, Scientific and Cultural Organization’s (UNESCO) list of World Heritage Sites, and Mount Emei is one of China’s main tourist attractions.

Fortunately, both sites escaped severe damage from the earthquake that struck Sichuan Province on 12 May, 2008.

Mount Tai

Tài Shān 泰山

A sacred and scenic site since prehistoric times, Mount Tai (Taishan), in Shandong Province, has figured in the lives of Chinese elite and Chinese commoners; it maintains its hold on the Chinese imagination to this day.

Mount Tai (Taishan) is a sacred mountain in Shandong province, 450 kilometers south of Beijing. The mountain has been significant to Daoism, Confucianism, Buddhism, nationalism, and imperial ritual. At 1,545 meters Mount Tai, the highest peak in the North China Plain, was the site of prehistoric agricultural rain worship. In 1987 the United Nations Educational, Scientific and Cultural Organization (UNESCO) designated Mount Tai a World Heritage Site.

Sacred Rites

Beginning in the Zhou dynasty (1045–256 BCE), Mount Tai became the chief of four sacred mountains (yue) used for imperial legitimation rites at cardinal compass points: Mount Tai (Eastern Peak, or Dongyue), Mount Heng (southern, or Nanyue), Mount Hua (western, or Xiyue), and Mount Heng (northern, or Beiyue). The Book of History, a compilation of documents going back to the sixth century BCE, describes the sage rulers Shun and Yao completing essential circuits of the mountains. By the late Zhou or early Han period (206 BCE–220 CE) a fifth, central peak, Mount Song (Zhongyue) was added to the collection of Daoist sacred mountains.

Special imperial legitimation rites dedicated to heaven were performed by emperors on top of Mount Tai, and special rites to earth on a hill at the base of the mountain. First performed by Qin Shihuangdi in 219 BCE, the rites legitimated an emperor’s rulership and commended his virtues. Emperor Han Wudi (reigned 140–87 BCE) performed these rituals several times. Both Qin Shihuangdi and Han Wudi linked their performances with their quests for immortality. Only four later emperors performed these solemn rites: Guangwudi (reigned 25–57 CE), Gaozong (reigned 650–683), Xuanzong (reigned 713–756), and Zhenzong (reigned 998–1022).

According to the fourth-century BCE text Mencius, Confucius climbed Mount Tai. Many admirers of Confucius have followed in his footsteps, ascending the slopes of Mount Tai in hopes of increasing their sagacity. In the Ming dynasty (1368–1644) a Confucian temple was built on the mountain.

Mount Tai and Life, Death

Because the sun rises in the east, Mount Tai, as the eastern sacred peak, was seen as the source of all life and therefore the leader of the five sacred peaks. By the late first century BCE people believed the mountain presided over death; by the middle of the second century CE, when people died, they were said to “return to Mount Tai.” Buddhist beliefs about reincarnation and an underworld were gradually integrated with indigenous Chinese beliefs until
by the seventh century many Chinese believed that souls returned to Mount Tai and passed through a series of ten courts in the underworld, where they were judged and punished before rebirth. The personified god of Mount Tai was the judge in the seventh court. Popular worship of this god centered on reducing the period of suffering for recently departed relatives. The vast majority of pilgrims during the Yuan dynasty (1279–1368) and the early Ming dynasty journeyed to worship the god of Mount Tai as a judge in the underworld.

By 1550 the popularity of the god of Mount Tai had diminished greatly. In contrast, the popularity of the goddess of Mount Tai, Bixia Yuanjun, steadily increased over the fifteenth and sixteenth centuries (when Guanyin, a Buddhist goddess, and Mazu, a Daoist goddess, also became popular). The goddess of Mount Tai is an important northern Chinese fertility deity, although she continues to be appealed to for more general well-being and success. Accordingly, women of childbearing age prayed and still pray to her, especially for sons. Assistant goddesses specialize in eye ailments and aspects of pregnancy or infancy—for example, conception, delivery, nursing, and smallpox (which was contracted in infancy or early childhood). Pilgrimages to the Bixia temple on top of the mountain were extremely popular during the late imperial period from the mid-Ming (c. 1500) onward through the Qing (1644–1912), averaging at least 400,000 people a year, mostly traveling from within 350 kilometers.

During the late imperial period literati from the entire country made the trip, often when passing near the mountain on official business. Most of them sought inspiration through communing with nature, viewing historic sites, admiring the content and calligraphy of inscriptions, reciting poems about the mountain by famous poets such as Li Bai (Bo) (701–762) and Du Fu (712–770), and writing their own reflections about Mount Tai in poetry and prose.

Two important visitors to Mount Tai during the late imperial period were the Manchu emperors Kangxi (r. 1662–1722) and Qianlong (reigned 1661–1795) of the Qing dynasty. Both rejected the idea of performing the feng and shan rituals because they were not actually ancient rites found in any classical texts and because the rituals implied that rulership could reach a point of perfection. Kangxi used visits to the mountain to demonstrate to the Han Chinese elite that the Manchu understood and respected Chinese practices and history. Qianlong used the mountain to further his own aggrandizement, even having the text of several of his poems engraved as the largest inscription on the mountain.

Continuing Religious Site

The mountain also became an important symbol of Han Chinese nationalism. The governments of Republican China (1912–1949) and People’s Republic of China (1949–present) both sought to secularize the sacred mountain. Publications and laws criticized many of the religious practices on the mountain as superstitious and sought to focus visitors’ attentions on historic and natural sites. Despite these attempts, religious worship on the mountain thrived during the Republican period. After 1949 religious worship across the country was restricted. During the Cultural Revolution (1966–1976) all temples were closed and the primarily Daoist resident monks and nuns sent away to perform secular work elsewhere.

With the economic reforms of the 1980s came a lessening of restrictions on religion. The government undertook many restoration projects on the mountain, including restoration of many temples. Religious practitioners were again allowed to reside in some temples. While the majority of visitors today would not identify themselves as religious pilgrims and the Communist party remains officially atheist, religious practice on Mount Tai continues to flourish.

Internationally the mountain has gained greater visibility. Many overseas Chinese include a visit to Mount Tai when in China. In 1987 UNESCO named Mount Tai a World Heritage Site. The Chinese government chose to include Mount Tai as one of the Chinese sites for an international New Year’s Day 2000 broadcast. In 2005 the baby panda born in the National Zoo in Washington, D.C., was named Taishan after more than 200,000 Internet votes from around the world.

A Guided Pilgrimage

While there is much written about pilgrimages to the sacred Mount Tai (Taishan), there is often no mention of paid and guided tours of the mountain, an early form of spiritual tourism. Chang Tai, a seventeenth-century member of the Chinese literati, chronicles his experiences on a guided “pilgrimage” to Mount Tai.

The company sets a fixed rate for renting rooms, hiring sedan chairs, and paying mountain fees. Visitors are charged on the basis of three classes: upper, middle, and lower. All the visitors are met upon their arrival, entertained when they descend from the summit, and escorted when they leave. Each day there are several thousand visitors... The guides are from about a dozen families. On an average day eight thousand to nine thousand visitors come, while the number can reach twenty thousand on the first day of spring. The entrance fee is collected at twelve fen per person, so the annual collection amounts to two hundred thousand to three hundred thousand taels. The magnitude of Mount T’ai, alas, can be measured by the number of the guides or the amount of the fees!

Mount Wudang

Wūdāng Shān 武当山

Wudang Shan (Mount Wudang) is located in northwest Hubei Province, central eastern China, near the city of Shiyan. It is also known as Taihe Mountain. The highest peak, Tianzhu Feng (Heaven-Supporting Pillar), rises 1,612 meters above sea level, and the mountain includes seventy-two peaks, cliffs, ravines, caves, and water pools.

One of the most sacred places in Daoism (and one of 72 blessed sites), Mount Wudang is famous for its complex of palaces and temples, which date from the Yuan (1279–1368), Ming (1368–1644), and Qing (1644–1912) dynasties. The oldest of the Taoist temples, Wulong (Five Dragon Temple), dates from the early Tang dynasty (617–906).

The mountain’s fame began in the late thirteenth century, as it was thought to be the place where the god Zhenwu (Perfected Warrior) became an immortal, and the mountain is a reminder of Zhenwu’s spirit. The Nanya Temple (Nanyangong) marks the site where Zhenwu achieved immortality. During the first thirty years of the Ming dynasty the Hongwu emperor began patronage of the mountain and established a cult of Zhenwu.

The Ming emperor Cheng Zu (also known as the the Yongle emperor), a Daoist, began the construction of thirty-three halls and monasteries in 1412, perhaps the best known of which are the Golden Pavilion (Jindian).
on the peak, the Purple Cloud Temple (Zixiaogong), and Nanyan Temple. The temple complex covers more than 1.6 million square meters and contains eight main temples, two monasteries, thirty-six hermitages, and many lesser temples. One of the largest temples, Yuxugong, which covered six hectares, burned in 1745 and only part of it remains today. Wudang, and specifically the Yuzhen Temple (Yuzhengong), is also known as the birthplace of Wudang shadow boxing, or wudang taiyi wuxing. This martial art, known as Tai Chi in the West, was most likely developed by the Wudang Daoist Zhang Sanfeng (1391–1458), who is thought to have been inspired by witnessing a fight between a crane (or magpie) and a cobra. The Wudang temple complex was largely abandoned during the Cultural Revolution (1966–1976) but has since been restored and has become popular with tourists. The Yuzhen Temple burned in 2003 but the golden statue of Zhang Sanfeng had already been removed and escaped the flames. The palace and temple complex on Wudang was inscribed on the United Nations Educational, Scientific, and Cultural Organization (UNESCO) World Heritage List in 1994.

Moxibustion
Moxibustion is a healing art of traditional Chinese medicine in which herbs are burned to stimulate acupuncture points on the body of a patient. Today it is commonly practiced in conjunction with acupuncture and Western medical procedures.

Moxibustion, as a healing art of traditional Chinese medicine, cannot be separated from acupuncture, which is the practice of inserting fine needles through the skin at specific points to cure disease or relieve pain. By definition *moxibustion* means the use of *moxa* (a Japanese term for wormwood, *Artemisia vulgaris*) as a cautery (an agent used to burn, sear, or destroy tissue) by igniting it close to the skin. *Moxa* is a soft, woolly mass prepared from the young leaves of various wormwoods of Eastern Asia.

Moxibustion treatment is conducted with *moxa* rolls or sticks, which, after being ignited, can be held by the doctor’s hand at a distance of three centimeters or so from the selected acupuncture points for ten to fifteen minutes, resulting in a *moxa* cauterization effect. Moxibustion, therefore, can also be defined as the process of burning herbs to stimulate acupuncture points. With special indications such as acute abdominal pain caused by cold, facial muscle atrophy of unknown etiology (the cause of a disease or abnormal condition), and so forth, a thin, small slice of ginger as an insulator can be put at the site of the acupoint between the ignited *moxa* roll and the skin. The patient may feel heat at the acupoint. Alternatively,
theory and principles of channels and collaterals must be learned to master the art of both moxibustion and acupuncture. In traditional Chinese medicine channels are the main trunks that run lengthwise through the body, and collaterals are their connecting branches. Together they connect the superficial, interior, upper, and lower parts of the body. Qi (life energy) courses through the channels.

The concept of administering moxibustion (or moxibustion plus acupuncture) is based on providing heat stimulation at the acupuncture points along the channels and collaterals. The effects are twofold. First is local hyperthermia therapy, and second is the effect on remote organs along the channels and collaterals. The selection of the moxibustion and acupoints is done according to the indications of the disorder.

Moxibustion and acupuncture today are practiced in departments of traditional Chinese medicine and in many Chinese hospitals, where traditional Chinese medicine is integrated with Western medicine. Research has concluded that serious adverse events are rare in the standard practice of moxibustion and acupuncture.

The philosopher Mozi and the school he founded offered a popular alternative to Confucian teachings. Mozi was unique among ancient philosophers in his belief that if an idea has been handed down from the ancient sages but does not benefit the people, it should be rejected.

Mozi (Master Mo) was born in the state of either Song or Lu. He later served as a high official in Song. Scholars believe, because he was an artisan and because his philosophy and his images and analogies drawn from technical crafts were practical, that Mozi came from the lower classes. In fact, King Hui of Chu (488–432 BCE) refused to grant Mozi an audience supposedly because of Mozi's low status. Some scholars believe that when Mozi was young he studied the teachings of the philosopher Confucius; Mozi's essays clearly attack the major tenants of Confucianism. Ancient texts do not show Mozi in debate with Confucian scholars; rather, they show him in debate with Gongshu Ban, Chu's chief military strategist, regarding "Cloud ladders," wheel-driven ramps that could scale city walls. Mozi convinced the king of Chu not to employ the ladder militarily against Song, an act that represents Mozi's values of loving everybody and defending the underdog.

The Mohist school that Mozi founded was a popular alternative to Confucian teachings. The school developed standards for evidence, proof, argument, and definition but died out by the Han dynasty (206 BCE–220 CE). Modern scholars have revitalized interest in the school's early development of logic.

The Mozi (the philosophical text compiled by Mohists from Mozi's thought) clearly attacks Confucian values. Mozi and his disciples opposed the extravagant use of rituals and music. They especially opposed elaborate funerals, which were an important part of Confucian ancestor veneration. The Mohists favored a utilitarian approach (relating to a doctrine that the useful is the good and that the determining consideration of right conduct should be the usefulness of its consequences) and denounced elaborate court music, ritual, and funerals because such activities wasted state resources that could be used to benefit the people. The Mohists also denounced offensive warfare. Mozi rejected the Confucian concept of destiny (ming), and his text does not mention the aristocratic Confucian distinction between the "prince of virtue," or gentleman, and the "petty person." Mozi especially rejected the Confucian clan value of differing levels of love, instead advocating jianai (love for everyone). Mozi's idea of love for everyone possibly came from the Confucian ideal of empathy (shu). Love for everyone is based on treating other families, states, and persons as if they were one's own. However, Mozi's idea of love for everyone is not correctly translated as universal love because jian implies "for each," not "for all," and in this context love is moral concern, not deep emotional affection. Mozi regarded concern for every person as the unifying principle of morality. Later Mohists believed that love for everyone entails a notion of moral equality but not social equality.

The Mohist school was well organized under a grand master during the fourth and third centuries BCE. But
by the end of that time the school split into three sects that differed in their interpretation of the teachings of Mozi, and each denounced the others as heretics. The three sects were the purists, the compromisers, and the reactionaries. Mohists who took office were expected to donate money to the organization, and the grand master could remove them from office. The sects taught ten basic principles contained in the ten core essays of the *Mozi*: elevation (or promotion) of the worthy, conforming upwards, concern for every person, thrift in utilization, thrift in funerals, rejection of aggression, heaven’s intent, elucidating ghosts, rejection of music, and rejection of destiny. Many chapters of the *Mozi* have three versions, which are probably derived from the three sects.

Because Mohist doctrines were new, Mohists had to argue on their own behalf, a development that began systematic debate in ancient China. The expressions “to argue out alternatives,” “to distinguish,” and “rational discourse” were first used in the *Mozi*. The *Mozi* also suggests that the correctness of an idea is not dependent on the person who thought it. Whereas Confucians expect thinkers to both talk about and exemplify the way, Mohists discuss ideas based on the ideas’ merits regardless of who presents them.

Mozi presented three criteria to evaluate arguments: roots, evidence, and use. A position is accepted if its roots can be traced to practices of the ancient sages. A position is assented to if it is in accord with the understanding of the masses and if, when applied in the administration of the state or in the punishment of wrongdoers, it brings benefit to the people. The utilitarian and practical focus of Mozi’s philosophy is notable. He was unique among ancient moralists in the belief that if an idea or practice has been handed down from the ancient sages but does not benefit the people, it should be rejected. Such utilitarian or pragmatic concerns are the basis of many of his criticisms of Confucianism.

Chinese contemporary music encompasses a huge popular music industry spanning most of East Asia, a vibrant concert music scene in all of the major cities, and modern arrangements of traditional material.

Contemporary Chinese popular and classical music, although often incorporating Western elements such as symphonic form or rhythmic patterns, remains grounded in Chinese culture through the use of traditional instruments or melodies, through the use of subject matter from Chinese history, and through the use of modalities that allude to Chinese arts or philosophy.

Modern Interpretations of Traditional Chinese Music

By the early twentieth century, Chinese traditional music had already been influenced by increased international communication, especially in the large Eastern cities. Musicians such as Liu Tianhua, who also studied Western music, composed new pieces for erhu (two-stringed fiddle) and pipa (lute). During the civil war between the Nationalist and Communist forces, Mao Zedong outlined a new agenda for the arts, which he felt should serve the common people and the Party. After the founding of the People’s Republic of China in 1949, this plan was implemented throughout the nation, with the exception of Taiwan, Hong Kong, and other areas outside of Communist control. Because traditional music was thought to be useful for education and propaganda,
conservatories in the major cities created departments and began offering programs in these genres, along with Western music. Although many forms of traditional music thrived with government support, repertoires and instruments that were associated with religious practices and Confucian elitism, such as the guqin (a plucked seven-stringed instrument), were less fortunate. Ideological focus in music and other art forms reached an extreme point during the Cultural Revolution (1966–1976), when the performing arts under Madame Mao (Jiang Qing) were largely restricted to music associated with the “model pieces” (yangbanxi 票板戏). These works combined traditional opera instruments and styles with Western ballet and symphonic music and featured heroic proletarian figures and large-scale choreography with dancers bearing rifles. After the fall of the Gang of Four, traditional music again enjoyed government sponsorship, and experimentation with modern adaptations continued, but without overt political requirements.

**Popular Music**

In terms of musical structure, Chinese popular music generally adheres to international norms of style, and most of its unique features are related to language and vocal

inflections. The two most common languages used in popular music are Mandarin (in “Mandopop”) and Cantonese (in “Cantopop”), but other dialects are also used. The earliest genre of Chinese popular music, known as Shidaiqu 時代曲, was developed in Shanghai by Li Jinhui 黎锦辉 and others during the 1920s, and spread to other regions, even during the chaotic years of Japanese occupation and civil war. Often using traditional-sounding melodies accompanied by Western instruments such as piano and woodwinds, Shidaiqu was one of the earliest international popular music styles. After 1949 popular music with Western influence was discouraged in mainland China, where it was labeled as immoral, and it was quickly displaced by government-sponsored music more consistent with Marxist ideology. During this time, however, Chinese popular music continued to thrive in Taiwan, Hong Kong, and other enclaves. These areas became an essential part of a huge pan-Asian popular music culture which now spans almost all of East Asia—as reflected by a lively concert scene in the cities, a growing recording industry, fan clubs, karaoke bars and marketing targeted to promote the culture through the full range of electronic and print media.

One of many performers whose career illustrates the pan-Asian trend is vocalist Teresa Teng (Deng Lijun 鄧麗君), who became a pop music icon. Born in Taiwan in 1953, Teng rose to fame in the 1960s and became popular in Japan after signing a recording contract with Polydor Japan in 1973. Teresa Teng’s recordings in the Mandarin language were very popular in mainland China as well as Taiwan; she also recorded in Cantonese, Japanese, and English. Toward the end of the twentieth century, harder-edged forms of popular music also became prominent, including the work of rock musicians like Cui Jian 崔健. Even louder genres such as heavy metal soon appeared. Although censorship of lyrics and visual content is still a factor in China, an increasingly broad range of styles are available to audiences as popular music continues to diversify and become more accessible.

Western and Symphonic Music

In the early twentieth century, the study of Western music was encouraged by participants in the New Culture Movement (Xin Wenhua Yundong 新文化运动) who associated Western music with the transformational possibilities of Western democracy and science. In 1927 the National College of Music, which was later to become
the Shanghai Conservatory of Music, was established, and more Chinese musicians were able to study Western music within China. Other musicians decided to study Western music in Europe. One of the most well-known of these was Xian Xinghai, who studied in France, and returned to China to teach and write music, including his Yellow River Cantata (1939), which used the metaphor of the mighty river to inspire resistance to the Japanese invasion. This work integrates Chinese instruments and echoes of Chinese traditional music, such as martial music and local folk song, into a Western symphonic structure.

The stylistic gap between familiar popular and folk styles on one hand and more dissonant academic music on the other was more noticeable outside of the People’s Republic of China until the end of the Cultural Revolution. For example the composer Chou Wen-chung (周文中), who grew up in China but studied and worked in the United States, was able to develop a highly individualized modern style inspired by Chinese calligraphy. A younger Chinese composer who successfully merged modern compositional techniques with traditional aesthetics is Tan Dun, who studied at the Central Conservatory in Beijing after the end of the Cultural Revolution, and who quickly rose to international fame. Whether to use the term “Western” to describe these composers is debatable, since they are so firmly grounded in Chinese culture. For example, Tan Dun’s 2006 opera, The First Emperor, is based on characters from the Qin dynasty (221–206 BCE), and Chou Wen-chung has created a musical modality based on transformations that characterize the I Ching. Dun also used the medium of film to blur the distinctions between classical and popular music, composing the score for director Ang Lee’s martial arts film Crouching Tiger, Hidden Dragon, released in 2000. Through film and other media, more international audiences have been exposed to music by Chinese composers and performances by Chinese musicians.

Further Reading

Chinese traditional music, developed to accompany ritual and with pentatonic melodies that reach back to the thirteenth century, is characterized by instrumental variation on set tunes and percussive patterns. Instruments are often specific to a musical genre and context of performance: silk-stringed instruments and bamboo lutes for tea house performances and zithers for personal meditation, for example.

Music is part of Chinese community life. Much of Chinese traditional music, from folk songs to opera and from region to region, is based on ancient qupai, stock melodies performed on traditional instruments. Although some genres, such as the music performed in imperial courts, were lost during the social upheavals of the twentieth century, much of traditional music remains alive today, either performed traditionally or combined with Western instrumentation.

Origins

China’s diverse musical traditions and regional styles should be seen as part of a wider overview of music in Asia. Many instruments and musical genres, like the drum and shawm (a woodwind instrument) bands (guchui), the pipa (a four-string plucked lute), and the yangqin (a hammered dulcimer played with bamboo beaters) were brought to China from the the Near East and Central Asia.

Much Chinese music is linked to ritual contexts, from the Confucian rituals of the imperial court to those of village weddings, funerals, and festivals. The ritual music of the imperial court was imbued with complex Confucian theories that linked musical sound to the stability of the empire and the turning of the seasons. This music was lost at the beginning of the twentieth century with the abdication of the last emperor, but court entertainment music has been partially preserved in the beautiful instrumental traditions of Buddhist temples and village ritual ensembles.

Many of the melodies used in traditional Chinese music are drawn from a stock of melodies (qupai), distinct melodic units with titles that may be set to a variety of texts, found in varying forms in instrumental music and narrative song and opera genres across China. The titles or labels of these melodies are drawn from the Song dynasty (960–1279) poetry of the ninth and tenth centuries; the melodies themselves can be traced back to the Yuan dynasty (1279–1368).

Characteristics

The aesthetics of Chinese music, with its emphasis on harmony, restraint, and conformity to tradition is linked to the need for correct, nondeviating observance of ritual. Variation and reinterpretation of existing melodies are
prized over creation of the new. Generally, Chinese melodies are built on the pentatonic (five tones) scale, with two more pitches used as embellishment and for modulation. Stock melodies, called qupai, are identified by titles or labels. Variations of the skeletal qupai are distinguished by the speed, meter, and the degree of ornamentation. Each musical instrument ornaments (jiahua, loosely “adds flowers to”) the skeletal notes in its own way, creating a delicate variety of sounds. Meter is marked by banyan (beats and “eyes,” or secondary beats), based on the beats of the ban (wood clapper). In theory, ban is marked by a stroke of the clapper and yan by the stroke of the drum or woodblock. The resulting metrical pattern is analogous to a time signature. The most common traditional musical notation (gongchepu) uses symbols based on the heptatonic (seven-tone) scale. Notation serves as a basic guide, recording only the skeletal notes (guganyin) of a melody.

**Genres, Performers, and their Instruments**

Shawm bands are groups of musicians, usually male and traditionally low class, who perform daily life celebration music in and around their villages, most regularly at weddings, funerals, and market fairs. Each region has its own repertoire and style.

More widespread are the amateur silk and bamboo (sizhu) instrumental ensembles often found in urban tea-houses. They are named for the silk strings of the erhu (a two-stringed fiddle) and sanxian (a three-stringed lute) and the bamboo of the dizi (a transverse flute). Sizhu ensembles, whose repertoire is based on qupai or titled melodies, are most commonly found in central-eastern and southern China. Percussion ensembles of gongs, cymbals, and drum are also widespread.

The costumes and painted faces of the warrior (hualian), clown (chou), and woman warrior (wudan) and the stylized movements of actors are representative of traditional conventions of Chinese high opera such as the Beijing Opera. Traditional musical components include use of titled melodies, altered to fit the words of arias, and set percussion patterns that represent different characters and different dramatic situations. A drummer serves as conductor, directing the actors’ movements and leading a percussion ensemble that accompanies the dramatic action. Regional opera, performed at rural temple fairs or public theaters in town, draws on the same stock of melodies and stories taken from popular novels, but the music may be simpler, utilizing solo narrative songs, accompanied by percussion or sanxian lute.

A separate vocal genre is that of rural folk songs, often called mountain songs (shan’ge). Folk song is strongly tied to locality, so there is great regional variation. The most beautiful are thought to be the songs of northwest China, especially the bitter songs (suanqu’er) of the boat pullers on the Huang (Yellow) River and the camel drivers on the Silk Roads.

Few traditional genres are performed by women, but in folk-song festivals held in the northwest and linked to the temple fairs, men and women gather in groups to sing improvised, often crude sexual lyrics. Such occasions lie outside the normally strict Confucian morality of village life. Another genre with women performers is the southern narrative song genre of nanguan, in which vocals are accompanied by the wooden clapper, pipa and sanxian lutes, xiao (flute), and erxian (two-stringed fiddle).

Distinct from the ensembles and community context of shawm bands, silk and bamboo groups, opera, and folk songs is the unique and ancient musical tradition of the guqin (a seven-stringed zither). This instrument, played for personal refinement and meditation of gentlemen-scholars, has come to be emblematic of Chinese music. Its tunes are thought to be programmatic, describing a scene or story, and much traditional literature is devoted to tales of disciples who perfectly understood the mood and images their master’s playing evoked. The guqin has its own special complex notation, and its performance traditionally involves an element of historical research: interpretation and reworking of centuries-old scores and their commentaries, themselves based on still earlier notations.

**Modernization and Westernization**

All of these traditional genres still thrive in contemporary China, but the twentieth century brought modernization
and Westernization to Chinese music. Western instruments, theories, and attitudes were introduced, and a musical schooling system and new professional troupes and orchestras were established.

The Communist revolution in 1949 brought with it attacks on traditional culture along with extensive reworking of folk music to produce revolutionary folk songs. Model operas (yangbanxi), which the Communist cultural authorities used to instruct people by using revolutionary models as characters, feature elements of traditional music and proletarian protagonists. After the excesses of the Cultural Revolution (1966–1976), the loosening of social controls in the 1980s brought about a great revival of traditional music alongside its old ritual contexts. It also permitted the swift rise of a booming industry of pop and rock music that has been promoted on television and through ubiquitous karaoke bars. The rock music of Cui Jian combines traditional Chinese and Western instruments and adds Western rock cadences to traditional Chinese melodies. Several modern Chinese composers have also achieved international recognition with works that draw in part on Chinese traditions. Tan Dun, who wrote the score for the movie Crouching Tiger, Hidden Dragon, composed the symphony Li Sao, based on a fourth-century BCE Hunan lament, to be played by a Western symphony orchestra. An integral part of China’s history and identity both in style and instrumentation, traditional music in China continues to evolve its way into modernity.

Chinese musical instruments have been evolving since the first millennia BCE, when instruments of “eight sounds” were developed and categorized according to their material composition. International contact led to adoption and adaptation of instruments developed elsewhere. In the modern era Chinese music incorporates both Western and traditional Chinese instrumentation.

China’s musical instruments have evolved in ways that express China’s aesthetic connections with the beauty and power of nature. While traditional instruments have sometimes been associated with specific regions and ethnicities within China, they have also been an important component of an emerging national musical identity, usually grounded in elements shared by groups within China’s Han majority.

Earliest Instruments

Both literary and archeological records reveal the importance of musical instruments from the very beginning of Chinese civilization. Literary records credited the legendary first emperors with the invention of various instruments, and some of the earliest, including the bianqing (suspended stones) and bianzhong (suspended bells), were used in court rituals. Both are still used in Confucian ceremonies. These instruments are sets of tuned idiophones (instruments whose sound is produced by vibrations of the material of the instrument); they are made of stone and bronze, respectively, and are mounted on wooded frames. The character for music, 乐 yueh, is derived from an ancient representation of these instruments. A much softer ancient instrument,
the *guqin* 古琴, a bridgeless zither, was favored by Confucius, who admired its subtle qualities. Over centuries, an extensive written body of solos was developed for this instrument, which well-educated scholars considered to be an essential vehicle for personal aesthetic refinement. Another zither, the harp-like *zheng* 箜篌, which has strings suspended on moveable bridges, evolved somewhat later, and formed the prototype for the Japanese *koto* and other East Asian instruments.

### Instruments of “Eight Sounds”

During the time of the Zhou dynasty (1045–256 BCE), instruments were classified according to their material composition and associated sound qualities. These categories, known as *bayin* 八音 (eight sounds), included the following: silk, bamboo, stone, wood, metal, clay, gourd, and skin. Through correlative cosmology, these categories were connected with the primary directions and seasons of the year. Court rituals were supposed to harmonize the earthly realm with the cosmos, and officials took responsibility to see that instruments were tuned properly for this purpose. The *sheng* 竹筚篥, an ancient mouth organ, was used to represent the gourd category because of its gourd resonating chamber, although its sound pipes were made of bamboo. The *sheng*, a distant instrumental relative of the Western pipe organ, is still in use today, although modern instruments have sound chambers made of other materials. While prehistoric flutes made of bone have been found by archeologists, bamboo flutes flourished throughout most of recorded history, and are used extensively in regional ensemble music. The most popular bamboo flutes today are the *dizi* 笛子, a transverse flute, and the *xiao* 竹, a vertical flute.

The softer and more stationary instruments were used for indoor music, while louder and more mobile percussion and wind instruments were used outdoors, originally for processions. These indoor and outdoor ensemble traditions evolved in diverse regional styles. The softer ensemble traditions are often referred to generically as *sizhu* (silk and bamboo), borrowing two of the ancient “eight sound” categories to emphasize the importance of stringed instruments and flutes, even though the ensembles may include other kinds of instruments. The outdoor ensembles include many kinds of drums and often include the piercing sound of the *suona* 噗吶, a double reed instrument related to the Indian *shenai* and Western...
The shorter, fatter flute is a dizī 箫子. The longer, thinner flute with a notch on one end (also of darker wood) is a xiao 箫. The wooden fish (also called a “temple block” by Western musicians) is a muyu 木鱼. Photo by Anna Myers.

oboé. A generic term for these louder ensembles is gu-chui (“drums and winds,” although some ensembles may include other kinds of instruments). Along with a great variety of drums, which formed the “skin” category of the “eight sounds,” numerous bells, cymbals, and gongs were developed.

International Influences

As China’s borders expanded, contact with Central Asian and other cultures along the Silk Roads led to musical exchanges, and plucked lutes entered China during the Han dynasty (206 BCE–220 CE). Central Asian and Indian

plucked lutes influenced the development of the Chinese pipa 琵琶 and ruan 琵。

Centuries later, during another phase of increased international contact during the Mongol period [Yuan dynasty (1279–1368)], the bowed lutes were introduced, and the two-string fiddle, the erhu 二胡, and related instruments became important in regional ensemble and dramatic music. The last imported instrument to be widely adopted during the dynastic period was the yangqin 扬琴, a hammered dulcimer derived from Central Asian instruments such as the santur. The yangqin entered China during the Ming dynasty (1368–1644), and
despite being called “the foreign instrument,” its distinctive articulation became part of many ensemble genres. Indigenous instruments continued to evolve as well, and special gongs were developed to accent the libretti of regional opera genres with rising and falling pitches.

Twentieth and Early Twenty-First Centuries

In the twentieth century, the bowed instruments of the huqin family were expanded to facilitate large ensembles, roughly paralleling the string section of the Western orchestra. Originally based on arrangements of traditional “silk and bamboo” repertoire primarily from southern regions, the inclusion of regional chamber music in a more nationalized style was centered in urban communities and paralleled the practice of Western music. The traditional genres continued to flourish in diasporic communities as well as within China. Traditional Chinese instruments were also combined with Western instruments in concerti and symphonic works. During the Cultural Revolution (1966–1976), Chinese instruments were used in the eight revolutionary operas, although use of the guqin with its elite associations, and other instruments associated with religious ritual, was discouraged. After the end of the Cultural Revolution, modern composers such as Tan Dun continued to experiment with combinations of Chinese traditional and Western instruments. The cellist Yo-Yo Ma, inspired by earlier periods of contact between civilizations, established the Silk Road Project, led concerts worldwide and commissioned many new works in blended musical styles and instrumentation. Chinese traditional instruments, reflecting several millennia of culture, form a significant part of the global orchestra.

While it is now common for Chinese to adopt a Western name, the act of naming in China is considered both a challenge and an art. A given name often reflects the hopes and aspirations parents have for their child, and because the given names are so personalized, one's identity and personality is often deduced simply from their name.

Choosing a name for a newborn is an important decision for all parents, even for the “parents” of companies (think of Google). But for Chinese parents the process of naming their infants is even more important; it reflects a complex aspect of their culture and has characteristics very different from Western naming systems. Chinese names can be chosen from a vast range of words, rather than being limited to religious or other origins. Chinese names are easily distinguished from any other names in the world. In the West parents usually name their children from a list of established names, such as Peter, François, Günther, Carlos, or Antonio. The Chinese, on the other hand, create personalized names by choosing words from a vast vocabulary that bestows unique meaning or significance.

Personalized Names
In the Chinese dictionary there is a wide choice of words that can be coined as names, although in practice some words are used more often than others are. It is often a challenge and an art to choose suitable and meaningful words as names. Embedded in most Chinese names are the parents’ aspirations and hopes for their children. Since a Chinese person knows the meaning of a specific name, it is often possible to understand what one’s parents had hoped for their child. And, since a person is addressed by his or her name throughout life whether he or she likes it, a person’s identity and perceived personality (until better known by others) are consciously or unconsciously associated with the name, whether or not he or she likes it.

The character for name 名 (ming) is made up of two components, twilight (xié) and mouth 口 (kou). Before the invention of electric light bulbs, in twilight hours when vision was poor, one needed to speak out his or her name to be identified, hence the concept of “name.”

Even today people subconsciously build up a mental picture of someone based on his or her picture, voice, and name. A good name is an excellent image builder. Names are coined from words that project esteemed character traits, such as beauty, confidence, excellence, grace, happiness, intelligence, a loving and caring nature, loyalty, tranquility, successfulness, trustworthiness, and ability to acquire wealth.

Chinese Naming System
A typical Chinese name has two or three elements. A name usually indicates that the person is of Chinese (Han) origin. The first element is the surname, or family name,  (xing, 姓), the remaining one or two names are
the given name (ming 名). Take the following name as an example: Chin Hon Fah 陈汉华. Chin is the surname and Hon Fah is the given name.

Placing the surname before the given name is consistent with the hierarchy of relationships. It is an acknowledgement that the parents’ and ancestors’ name is more important than one’s own name. Mistaking the surname as a given name or vice versa is often a source of confusion and embarrassment.

If one chooses to address a Chinese person by his or her given name, and that name consists of two words, it is important to realize that both words are used when addressing the person. The concept of a middle name, as it is known in the West, does not exist in Chinese. In the example mentioned earlier, Mr. Chin Hon Fah should be addressed as Hon Fah rather than as Hon or Fah.

Some Chinese names can be written in various ways in English, such as Chin Hon Fah, Chin Hon-Fah, or Chin Honfah. Mr. Chin living in Western society would probably place his surname last. His name would then become Hon Fah Chin or H. F. Chin.

The surname Chin, or Chen 陈, is the fifth most common surname in the Chinese naming system, with some 54.4 million people sharing it. It is the most common surname in Fujian, Guangdong, Hong Kong, Macao, Taiwan, and Zhejiang. Other spellings include Chan (Cantonese); Chang; Chén; Chern; Chin or Ching (Hakka); Ciin Dan (Hainan); Ding; Tan (Hokkien, Teochew); Tchen; Ting; Tjin (Indonesian); Tran (Vietnamese); and Zen.

Chinese Using Christian Names

Many people in Southeast Asia and in the West might know their ethnic Chinese friends by their Christian names. The Chinese are great survivors and adapt easily to new environments. Some have made their name easier for their friends, teachers, employers, and government authorities by adopting a Christian name, even though in some cases they might not be Christian by faith. Nevertheless, most keep their Chinese surname, thereby maintaining their ethnic identity.

If Mr. Chin were to adopt a Christian name such as Peter, his name would become either Peter Chin Hon Fah or Peter Chin or Peter H. F. Chin. In Indonesia and Thailand, most ethnic Chinese were coerced, induced, or otherwise legally required to adopt a local name. (The Indonesian government has relaxed this ruling in recent years.)

Westerners Adopting Chinese Names

In recent years some Westerners, in particular those living or working in China, have acquired Chinese names for academic, business, cultural, personal, or professional reasons. This practice aims to facilitate pronunciation of Western names, in most cases creating better rapport and closer relationships in the host country.

Chinese names can be acquired in two ways: direct translation of the Western name or adoption of a Chinese-style name with three elements, a single word for the surname and two words for the given name. Either way, it is important to be aware of the visual image connected with the name.

Chinese Names and Harmony

The traditional Chinese psyche believes in harmony and balance among various elements or entities in nature. One of the unique features in the Chinese naming system lies in its ability to harmonize with nature, in particular creating balance among the five determinant elements: metal, fire, water, wood, and earth. These elements are reflected in one’s personality, character, relationships with others, health issues, and cycles of ups and downs in life. An individual at birth would have an inherent combination of the five elements. Through a prudent choice of naming words, some people believe that it is possible to supplement any deficiency inherent at birth and rebalance the elements.

Further Reading

Nanjing is the capital of Jiangsu Province. The city for a while was the capital of the Ming dynasty and of Chiang Kai-shek’s Chinese Nationalist Party. In 1937 and 1938 many thousands of residents of the city were victims of war crimes by the Japanese army.

Nanjing (Nanking), the capital of Jiangsu Province in central eastern China, is located on the southern bank of the Yangzi (Chang) River. Nanjing has played an important role in Chinese history. Indeed, the city’s name means “southern capital,” and Nanjing was the capital of the kingdom of Wu (220–280 CE) and several other minor dynasties between the third and sixth centuries before becoming the capital of the Ming dynasty (1368–1644) between 1368 and 1421. In the early 1420s Yung Lo (reigned 1403–1424), the third Ming emperor, moved the capital to Beijing, the “northern capital.”

However, Nanjing continued to play an important role in the administration and economy of the lower Yangzi River area during the later Ming and Qing (1644–1912) dynasties because of its proximity to the major river of central China and the Grand Canal, which linked the southern part of the empire to the administrative north. During the Taiping Rebellion of the mid-nineteenth century Nanjing was the rebels’ capital between 1853 and 1864.

After the October 1911 revolution the new president, Sun Yat-sen, proclaimed the founding of the Republic of China (1912–1949) in Nanjing. Between 1927 and 1937 the city again was the national capital under Chiang Kai-shek’s Chinese Nationalist Party (Guomindang). In December 1937 Nanjing was captured by the Japanese army, beginning the Nanjing Massacre, one of the worst atrocities of the War of Resistance against Japan (1937–1945), known outside China as the Second Sino-Japanese War. The victorious Japanese armies raped and killed many of the local civilian population, which resulted in the name given to the massacre by the Chinese, “The Rape of Nanjing.” Between 100,000 and 300,000 Chinese had been killed by the time order was restored six weeks later. (The exact numbers have been the subject of some dispute, in part depending on whether the source is Chinese or Japanese. The Tokyo War Crimes Tribunal concluded that
Whither the Nanking government?

During the Civil War (1945–1949) between the Communists and the Nationalist Party (Guomindang, also spelled Kuomintang), Nanjing (known as Nanking at the time) became the capital of Nationalist China under Chiang Kai-shek. This extract comes from Mao Zedong’s statement of 4 April 1949, “Whither the Nanking Government?”

Two roads are open to the Nanking Kuomintang government and its military and administrative personnel. Either they cling to the Chiang Kai-shek clique of war criminals and its master, U.S. imperialism, that is, continue to be the enemy of the people and so perish together with the Chiang Kai-shek clique of war criminals in the People’s War of Liberation. Or they come over to the people, that is, break with the Chiang Kai-shek clique of war criminals and U.S. imperialism, perform meritorious service in the People’s War of Liberation to atone for their crimes and so obtain clemency and understanding from the people. There is no third road…The massacre which occurred in Nanking on April 1 was no accident. It was the inevitable result of the actions taken by the government of Li Tsung-jen and Ho Ying-chin to protect Chiang Kai-shek, his sworn followers and the forces of U.S. aggression. It was the result of the absurd trumpeting about “honourable peace on an equal footing” by the government of Li Tsung-jen and Ho Ying-chin and by the sworn followers of Chiang Kai-shek, which had the purpose of countering the Chinese Communist Party’s eight terms for peace, and particularly the punishment of war criminals. Now that the government of Li Tsung-jen and Ho Ying-chin has sent its delegation to Peiping to negotiate peace with the Communist Party of China and has indicated its willingness to accept the Communist Party’s eight terms as the basis for negotiations, it should, if it has the slightest good faith, start by dealing with the Nanking Massacre, arrest and severely punish the chief criminals, Chiang Kai-shek, Tang En-po and Chang Yao-ming, arrest and severely punish the thugs of the secret police in Nanking and Shanghai and arrest and severely punish the chief counter-revolutionaries, who are obstinately opposing peace, actively disrupting the peace negotiations and actively preparing to resist the advance of the People’s Liberation Army to the south of the Yangtze River. “Until Ching Fu is done away with, the crisis in the state of Lu will not be over.” Until the war criminals are eliminated, there will be no peace in the country. Isn’t this truth clear enough by now?

Further Reading
Japanese troops invaded and occupied Nanjing from November 1937 to February 1938. More than 200,000—possibly as many as 300,000, although exact numbers are in dispute—unarmed Chinese civilians and soldiers were killed during the six-week massacre.

The Nanjing Massacre (also known as the “Nanking Massacre” or the “Rape of Nanjing”) is the name given to the war crimes committed by Japanese troops during their invasion and occupation of Nanjing from November 1937 to February 1938. These crimes included the execution or murder of at least 200,000 unarmed Chinese soldiers and civilians, the rape and torture of about twenty thousand women and girls, the dismembering of human bodies, and the slaughter of domestic and farm animals.

The massacre was not restricted to Nanjing, which was the capital of Republican China (1912–1949) but rather occurred along the line of march of Japanese general Matsui Iwane’s Tenth Army and the Shanghai Expeditionary Force from Hangzhou—the landing site—through Shanghai.

The Nanjing Massacre was one of the worst atrocities committed by the Japanese in China during the eight-year period from 1937 to 1945. The massacre—resulting in the deaths of approximately 250,000 Chinese civilians and unarmed soldiers, the rape of many women and girls, and the destruction of cattle and other animals—remains a painful scar on China’s collective memory.
and into Nanjing. The massacre was contained only after establishment of the Japanese puppet government of Nanjing in March 1938. General Matsui was found guilty of crimes against humanity by the Tokyo War Crimes Tribunal and was sentenced to hang.

The massacre was well reported by the English-language press, but its memory was obscured for some years by the refusal of the Japanese government to admit to the massacre and by the failure of the Chinese government to raise the issue internationally. Not until the 1980s did the Chinese begin a serious study of the massacre. After careful research of burial records, documents, and interviews, researchers concluded that the massacre took the lives of nearly 300,000, a figure significantly greater than the estimate of 200,000 given by the Tokyo War Crimes Tribunal.

Corroboration of these numbers is important because the nationalist movement in Japan is attempting to deny the legitimacy of the war crimes tribunal. For the nationalist movement the war was a just and patriotic struggle against Western domination. China confirms and possibly exaggerates the tribunal’s findings in order to convince Asians that Japan has been and remains a threat to other Asian nations. The massacre has inspired artistic representations by both Japanese and Chinese artists, and the International Committee to Study the Nanjing Massacre has commissioned a symphonic requiem entitled Hun Qiao (Bridge of Spirits) to honor the victims. The search for the truth and meaningfulness of the Nanjing Massacre will be remembered in various ways for decades.

National Committee on United States–China Relations

The National Committee on United States–China Relations, founded in 1966 by a coalition of academic, civic, religious, and business leaders, is a network of prominent Americans who have influenced U.S. government policy (unofficially and officially) toward China. Through its educational outreach and exchange programs, it has created communities at all levels amongst people and institutions concerned with Sino–American relations.

Left to right: Robert Scalapino, Stephen A. Orlins, and Lucien Pye, at the 3 May 2006 NCUSCR program “Past as Prologue.” For more than forty years the National Committee on United States–China Relations has sponsored educational and outreach programs aimed to help Americans gain a deeper and more nuanced understanding of China. COURTESY OF NCUSCR.
U.S. Table Tennis Association) the Chinese Ping-Pong team’s famous tour of the United States, an event that captured world attention and was covered by all the major newspapers and television networks.

**Formation of the National Committee**

Diplomatic ties with China moved to Taiwan when the Communist Party took control of the mainland in 1949. Soon after, the “proxy war” (Korean War) put the United States and China into indirect military conflict. Through the 1950s and into the 1960s, the “China Lobby,” staunch anti-Communists said to be funded by the Kuomintang, had the support of many in Congress. An organization called the Committee of One Million actively opposed any U.S. engagement with the PRC.

The Committee was founded soon after two groundbreaking conferences on U.S.-China policy held in 1964 and 1965. A one-day “Institute on China Today” was held in Sproul Hall at University of California–Berkeley on 9
December 1964 with an overflow crowd of over one thousand. Speakers included Clare Booth Luce and Henry Luce, and unprecedented press attention seemed to lift what had been an unofficial ban on public debate about China policy. Buoyed by this success, the organizers soon arranged to hold a “National Conference on the United States and China” in Washington, D.C. on 28–30 April 1965. Participants included China scholars, policy experts, business people, religious and labor leaders, and State Department officials Deputy Assistant Secretary for Far Eastern Affairs Robert W. Barnett and Assistant Secretary for International Organization Affairs Harlan Cleveland, as well as representatives from the Republic of China (Taiwan) Foreign Ministry. Two senators, George McGovern and Peter H. Dominick, who held opposing views on China, nonetheless sent a joint invitation to their Senate colleagues and shared a platform at the conference.

The advisory and program committees for these conferences formed the basis for what was established in 1966 as a nonprofit educational organization, the National Committee on U.S.-China Relations. The Berkeley conference had been jointly organized by the San Francisco–based World Affairs Council, the University of California–Berkeley Department of Political Science, and the American Friends Service Committee (AFSC), a Quaker social justice organization dedicated to alleviating poverty and promoting peace. Cecil Thomas, the AFSC’s associate peace secretary and director of the Berkeley YMCA, considered engagement a means to end bloodshed and help the PRC deal with what was known to be widespread poverty (20–40 million Chinese died of starvation between 1959 and 1962). He became the National Committee’s first executive director.

Members of the Committee had widely different views (on the Vietnam War, for example), and the Committee’s first proposal to the Ford Foundation described it simply as a “group of prominent Americans, representative of industry, the academic world, the professions, labor, the churches, and of the nation’s major geographic areas.” The Committee was vehemently committed to non-advocacy,
balance, and diversity because it was so clear that the public discourse the members sought would not be successful if the Committee’s membership could be tagged as partisan or biased.

While the Committee’s public mission was solely educational, it was connected, focused, and gave a common platform to leaders from many sectors. The result was, many observers say, influence on government policies during a period when there was considerable disagreement about how best to deal with other global powers and with Communist leadership—especially given that the McCarthy era was still fresh in the minds of many Americans. U.S. presidents wanted to move closer to normalization of relations with China but faced much resistance in Congress. By privately advising Johnson in 1968 and Nixon in 1970 in their dealings with Communist China, members of the National Committee played a vital role in the move towards normalization.

**Programs 1970 to 2000**

During the years leading up to normalization in 1979, the National Committee encouraged thoughtful discussion about China policy among Americans. The founders (who included some of the giants of the China field such as Robert Scalapino, A. Doak Barnett, Alexander...
Eckstein and Lucien Pye) also believed that direct dialogue between Americans and Chinese would lead to improved understanding and then to stable and productive relations, and to enhanced academic and business cooperation. Exchange programs, tours with Congressional leaders, and hosting events with visiting Chinese officials has been part of the Committee’s work since its earliest days.

The National Committee became the principal organization conducting public policy and other exchanges between China and the United States, and helped to shift U.S. policy and public opinion during the years leading up to the reopening of diplomatic relations in 1979. It worked with other organizations, such as the Committee on Scholarly Communications with the People’s Republic of China (CSCPRC), also founded in 1966 but focusing on academic, scientific and scholarly exchanges, and helped in the early formation of other sister organizations such as the National Council on U.S.-China Trade (now the U.S.-China Business Council) and the Center for U.S.-China Arts Exchange.

In the 1980s the Committee expanded its work beyond its 1970s exchanges in civic affairs, education, performing arts, and athletics to a variety of fields, promoting sustained interchange between influential Chinese and Americans in governance, the media, urban planning, international relations, and economic planning and management. In the mid-1980s, the National Committee established the first formal, ongoing Track II (unofficial) discussion, the U.S.-China Dialogue, an off-the-record gathering of leading citizens of China and America; it was held another ten times before coming to an end in 2002.

While continuing its programs of the past, the decade of the 1990s saw a focus on rule of law, legislative affairs and the expansion of civil society in China. These programs included regular exchanges of city mayors and municipal and provincial leaders, with an emphasis on urban planning, infrastructure development, sustainable development and related environmental concerns; programs in judicial training and exchanges of senior judges, including a 1996 trip to China by U.S. supreme court justice Anthony M. Kennedy; and exchanges and programs focused on banking and economic policy development, journalism, NGO and foundation development, human rights, public health and economic development.

**Programs from 2000 on: Evolving Role in Global Cooperation**

The National Committee is a network of more than 750 Americans from all parts of the country and nearly one
hundred corporations and professional firms. They bring many different perspectives on issues and priorities in U.S.-China relations, but share a commitment to ongoing public education and the enabling of face-to-face contact. Members of the Committee and its board of directors include many distinguished citizens: former secretaries of state Madeleine K. Albright, Henry A. Kissinger, and Condoleezza Rice and other former cabinet secretaries; all of the former American ambassadors to China; Richard Holbrooke, former chair of the Asia Society and Special Envoy to Afghanistan; leading scholars of the past several decades such as Jerome A. Cohen, Harry Harding, David Lampton, Nick Lardy, Kenneth Lieberthal, Susan Shirk, and Ezra Vogel; and Maurice R. Greenberg and many other corporate executives interested in China.

The National Committee’s continuity of experience and depth of associations in Greater China and the United States continue to support its ongoing mission. New programs are regularly developed in response to shifting needs and opportunities, while the National Committee remains true to the founders’ purpose of helping Americans gain a deeper and more nuanced understanding of China and, thereby, insuring a thoughtful, effective U.S. policy on China. These programs have been developed in relation to three main goals.

**Informing Policy Leaders and Opinion Shapers**

Programs have included delegations of members of congress and congressional staffers to China; special briefings for new congressional members; delegations of municipal and state leaders to exchange best practices in city and state governance; a Policy Leaders Orientation Program.
that provides an in-depth view of American society, history and politics to Chinese officials and consular officers. A series of in-depth briefings on China for military officers are designed to broaden their knowledge and understanding of China, its culture, society, and politics, in an effort to enhance their dealings in the region.

**DEVELOPING THE CAPACITY OF NEXT-GENERATION POLICY LEADERS**

The National Committee is focused on investment in the next generation of American and Chinese leaders by creating meaningful opportunities for outstanding American and Chinese young professionals and students to interact with one another. Programs include the Young Leaders Forum, established in 2002 for under-forty-year-old American and Chinese leaders in many fields, in which those leaders explore substantive issues together and develop collaborative relationships. Annual retreats alternate between a U.S. and China locale. The 2008 Forum, held in Washington State, was designed around the theme of “Discovery.” Young Leaders Forum Fellows, including government officials, authors, university leaders, entrepreneurs, musicians, and artists, discussed with one another how their personal discoveries came about and influenced their lives.

Other programs include the Public Intellectuals Program, which nurtures the younger generation of leading American China scholars, giving them the skills and opportunity to inform policy and public opinion; and the U.S.-China Student Leaders Exchange Program, which provides exchange opportunities for Presidential Scholars (specially selected American graduating high school seniors) and promising Chinese students.

**FACILITATING THE EXCHANGE OF IDEAS**

The National Committee expands knowledge about China by Americans and the United States by Chinese through exchange of professionals in a variety of fields (be it education, energy and the environment, the media, rule of law, etc.). The Teachers Exchange Program provides full academic-year opportunities for Chinese (K–12) teachers to teach (usually Chinese language and culture) in the United States and American teachers to teach (usually English as a second language) in China. One teacher described the experience of American teachers in Chinese middle schools as invigorating personally and professionally: Teachers in this program are loved and respected in China. They bring back more information and understanding of China into the classroom, but they more critically examine what they teach, how they teach, what should change, and appreciate more the very best things in American education.

The Committee also has a rich and varied public education program that regularly provides timely information directly from leading specialists on major issues of U.S.-China relations through seminars, panel programs, publications, e-mail briefings and conference calls. These offerings are coordinated with the National Committee’s Web site (www.ncuscr.org), which provides video, audio, and transcripts from selected programs, as well
as selected publications. Recent public programs have included CHINA Town Hall, a program on China conducted simultaneously in thirty-five American cities in cooperation with the local World Affairs Councils and other policy and educational institutions, and “Once Upon a Time in Beijing,” a panel featuring all five living former U.S. ambassadors to China reflecting on their tenures in China and the future of U.S.-China relations.

The National Committee has long benefited from the experience and expertise of its staff leadership. President Stephen A. Orlins speaks fluent Mandarin and was a member of the State Department legal team that created the framework for the historic opening in 1979. He has also served as president of Lehman Brothers Asia and as managing director of Carlyle Asia. Former presidents and executive directors John Holden, David M. Lampton, Arthur Rosen, and Preston Schoyer also had extensive China experience. Vice president Jan Berris has been with the National Committee since 1971 and has managed and led hundreds of delegations between the United States and China, including the 1972 Chinese Ping Pong Team, the first PRC group to visit the United States. The Committee has had a long line of distinguished chairpersons whose prestige and influence has been of great help to the organization; the latest is The Honorable Carla Hills, former Secretary of Housing and Urban Development and U.S. Trade Representative.

In the early years, the focus of the National Committee was on public education and outreach programs; private talks with leaders at the highest level and public policy conversations contributed to normalization of relations between the United States and the People’s Republic of China. Efforts now are more far-reaching: seminars and exchange programs for public officials, professionals, and students not only provide briefing for current leaders but develop new ones.

The Editors
After the Communist Party of China defeated the Nationalists in the Chinese Civil War (1945–1949), 1 October became National Day, in lieu of 10 October, the traditional anniversary of the overthrow of the last Qing emperor. (Taiwan still celebrates 10 October.) Celebrations of the new National Day on the mainland have gone through various forms in accordance with different political, economic, and social changes.

The Chinese on the mainland celebrate their National Day on 1 October while those on the island of Taiwan celebrate the day the Republic of China replaced the Qing Dynasty, 10 October 1911. (The emperor did not abdicate, however, until February 1912.) The day the Japanese surrendered to the Chinese, 3 September 1945, brought to an end the anti-Japanese alliance between the Communists led by Mao Zedong and the Nationalists led by Chiang Kai-shek; the two factions immediately turned against each other again. After the fall of Nanjing, the seat of the Nationalist government, on 23 April 1949, Chiang Kai-shek and his army retreated to Taiwan. On 1 October 1949, Mao Zedong proclaimed...
the founding of the People’s Republic of China (PRC) on the rostrum of Tiananmen Square in Beijing, in front of 300,000 people gathered there.

On 2 December 1949, the Central People’s Government of the PRC passed a resolution to set aside 1 October as Guoqingjie (National Celebration Day), or National Day, in English. Most Chinese customarily call it Guoqing (National Celebration) or simply Shiyi (October First). Since the return of Hong Kong (1997) and Macao (1999) to the Chinese sovereignty, National Day has also been celebrated in those territories.

From 1950 to 1959, National Day was routinely celebrated with a military parade in Tiananmen Square. The parade was discontinued in 1960 when the central government enforced stringent economic policies to combat widespread famine. Mass assemblies and processions took over in the 1960s. Starting from the early 1970s, organized and voluntary parties took place in parks throughout the country as a major form of National Day celebrations. From 1985 to 1999, organized activities gave way to individual choices. To boost the economy by encouraging tourism, the government created three controversial “Gold Weeks” in 1999 out of the festivals of Labor Day, National Day, and the Chinese New Year, making each a week-long holiday. An increasing number of Chinese people chose to spend the holiday touring the country and the world (first Southeast Asia and later Europe). In December 2007 National Day, along with Labor Day, was reestablished as a one-day holiday.

An unwritten rule regulates the observance of National Day. Every tenth anniversary, there should a grand celebration and every fifth, a lesser one. Inconsistently following this rule, two military parades took place, one on the thirty-eighth anniversary in 1984 and the other on the fiftieth in 1999.

A national reception in the Great Hall of the People, as a token of thanks to foreigners working in China along with Chinese dignitaries, has become part of the National Day tradition. A top national leader customarily presides over the ceremony. Chinese embassies also hold receptions for overseas Chinese and dignitaries of hosting countries. Usually a fireworks display is held in cities nationwide. The one in Hong Kong at the Victoria Harbor is an exceptional spectacle, favored by residents as well as tourists.

Plans for a grand celebration of the sixtieth anniversary of the founding of the People’s Republic of China on 1 October 2009 were muted by the global economic crisis that began in the autumn of 2008. A newspaper report in January 2009 claimed that the traditional military parades would “showcase strength and transparency” and would be a “‘warm but frugal and cost-effective’ show of the most sophisticated current weapon systems.”

National Resources Commission

Guójiā Zīyuán Wěiyuánhuì

The National Resources Commission was the leading Nationalist government economic bureaucracy in charge of heavy industrial reconstruction during the 1930s and 1940s. NRC activities brought about a tremendous expansion of state-owned heavy industries, laid the material foundation for the War of Resistance against Japan, and contributed to the formation of China’s state enterprise system.

The National Resources Commission (NRC) grew out of the National Defense Planning Commission (NDPC) that the Nationalist government created in November 1932. NRC activities brought about a tremendous expansion of state-owned heavy industries, laid the material foundation for the War of Resistance against Japan (1937–1945, known outside China as the Second Sino-Japanese War), and contributed to the formation of China’s state enterprise system.

Japan’s invasion of Manchuria in 1931 and its attack on Shanghai in January 1932 motivated the creation of the NDPC. Recognizing the necessity of preparing China for further Japanese aggression, Qian Changzhao, then deputy minister of the Ministry of Education, suggested to Generalissimo Chiang Kai-shek in late 1931 that a national defense planning commission be created. Chiang accepted Qian’s suggestion and asked Qian to draw up a list of would-be members of the proposed commission. After lengthy preparation the NDPC was formally established on 1 November 1932. Although the commission was placed under the General Staff of the Military Affairs Commission, it reported directly to Chiang, who served as president of both commissions. Weng Wen-hao was appointed secretary-general, and Qian Changzhao deputy secretary-general.

The NDPC was staffed by technocrats of various professions. It had thirty-nine members at the time of its establishment. In 1934 the commission recruited many new members, raising the original thirty-nine to well over one hundred. Among the commission members were humanists and social scientists, economists, industrial and financial leaders, electrical engineers, and mining, chemical, and weaponry experts. Until 1934 the commission consisted of a secretariat and seven sections: military affairs; international affairs; economics and finance; raw materials and manufacturing; transportation and communications; land, population, and foodstuffs; and cultural affairs. The commission conducted investigations and gathered statistics in areas of raw materials and manufacturing, transportation and communications, and economics and finance in preparation for defense planning.

New Name, New Duties

In April 1935 the NDPC was renamed the National Resources Commission (NRC) and placed under the jurisdiction of the Military Affairs Commission. Although Chiang continued to serve as president, and Weng Wen-hao and Qian Changzhao remained secretary-general and deputy secretary-general, respectively, changes
were clearly discernible in the commission’s organizational structure and definition of functions. In addition to the original investigation and statistics divisions, the NRC created three new offices and two divisions: offices of electrical engineering, metallurgy, and mining, a secretariat, and a planning division. At the same time, the NRC’s mission was redefined as investigation, statistical survey, and study of human and material resources; planning and reconstruction of resources; and planning of resource mobilization.

The 1935 reorganization marked an important change in purpose and direction. The original three departments in military affairs, international affairs, and education and culture ceased to exist. During the next three years the NRC changed its orientation from resource investigation and planning to heavy industrial reconstruction. In effect, the organization was transformed from Chiang’s brain trust to an organization in charge of industrial development, a change that manifested itself in the Three-Year Plan for Heavy Industrial Reconstruction completed in 1936. Compared with earlier government plans, it had several distinct characteristics: It was based on a large amount of data that experts gathered through systematic investigation. Heavy industry would receive the lion’s share of investment capital. Geographically most planned factories were to be built in interior provinces such as Hunan and Jiangxi for fear of further Japanese aggression. Finally, unlike in previous plans, most projects went according to the plan. Among some thirty planned factories and collieries, twenty-one had begun to be constructed by the time the war of resistance broke out in July 1937.

The outbreak of war and the relocation of the Nationalist government to Chongqing led to further changes in the NRC’s organization and activities. In March 1938 the Nationalist government placed the NRC under the jurisdiction of the newly created Ministry of Economic Affairs. Although Weng Wenhao and Qian Changzhao continued to lead the commission, their official titles were changed from secretary-general and deputy secretary-general to director and deputy director, respectively. More important, the function of the NRC was redefined to include the creation and management of basic industries, the development of mining resources and management of important collieries, and the creation and management of power plants.

The change of function gave rise to corresponding changes in the NRC’s organizational structure. Under the director and deputy director were four new divisions, four sections, and one committee: the secretariat, divisions of industry, mining, and electric power; sections of technology, economic research, accounting, and material purchase; and a committee of finance. Four years later the NRC further modified its organizational structure to reflect its expansion of activities. By now it had under its
jurisdiction seven divisions and two sections: the secretariat, divisions of industry, mining, electric power, material purchase, finance, and accounting; and sections of technology and economic research. The NRC had by 1938 become a bona fide technocracy in charge of directing heavy industrial development as well as managing enterprises under its jurisdiction.

**National Defense**

During the War of Resistance against Japan (1937–1945) the NRC drafted several plans designed to foster the development of heavy industries and related national defense industries. Overall the NRC established in China's interior roughly 130 state-owned enterprises in energy, petroleum, iron and steel, machinery, alcohol, and electric industries, drawing investment capital primarily from the annual budget appropriation from the state treasury. In 1940 the share of the NRC in the state budget reached its highest point during the war, accounting for 2.8 percent. After the war ended the NRC expanded its operations as it took over or confiscated enterprises controlled or managed by the Japanese and their Chinese collaborators. In June 1946 the Nationalist government removed the NRC from the Ministry of Economic Affairs and placed it under the jurisdiction of the Executive Yuan. In 1949 the NRC was again placed under the jurisdiction of the Ministry of Economic Affairs. By then the NRC had thirty thousand staff members and more than six hundred thousand workers. After 1949 some NRC personnel followed the Nationalist regime to Taiwan, but many stayed in mainland China and joined the Communist government, including key NRC leaders Weng Wenhao and Qian Changzhao. Virtually all NRC enterprises and corporations remained state-owned enterprises or were reorganized as state-owned enterprises after the Communist takeover.

In short, the NRC was the leading Nationalist economic bureaucracy in charge of heavy industrial reconstruction during the 1930s and 1940s. NRC activities brought about a tremendous expansion of state-owned heavy industries, laid the material foundation for the War of Resistance against Japan, and contributed to the formation of China’s state enterprise system.

National Taiwan University, founded by the Japanese colonial government in 1928, is the largest and most prestigious university in Taiwan.

The National Taiwan University is the oldest university in Taiwan. Its antecedent was the Taihoku (Taipei) Imperial University, founded by the Japanese colonial government in 1928. When the Taihoku University was first established, it had only two colleges with sixty students. It was then expanded to include five colleges with 382 students before the end of World War II.

Following Taiwan’s retrocession to Chinese sovereignty in 1945, the Nationalist government resumed the administration of the Taihoku University and renamed it National Taiwan University. Lo Tsung-lo, a Japan-trained botanist, was appointed by the Ministry of Education as the first president. During the 1950s, Japanese-trained scholars gradually faded away in academic circles. Since then, the position of NTU presidency was dominated by American-trained scholars. In the 2000 academic year, the university had in total ten colleges and eighty...
The campus of the National Taiwan University, the oldest university in the Republic of China (Taiwan). Over the past seventy years, the university has produced many prominent people in various fields. Its motto is “Integrity, Diligence, Patriotism, and Philanthropy.” As a symbol of growth and nurturing, the university chose to plant a row of palm trees along the avenue that leads to the library. departments and graduate institutes with a student body of more than 27,000. And in the 2007 academic year, the university had in total eleven colleges and 152 departments and graduate institutes with a student body of more than 32,000.

Over the past seventy years, the National Taiwan University produced many prominent people in various fields. According to 2005 statistics of the U.S. National Science Foundation, 1,190 graduates from National Taiwan University acquired a doctor’s degree in the United States from 1999 to 2003, ranking eleventh in the world. Among them, 376 received doctorates in engineering and life science, ranking second and ninth in the world, respectively. Furthermore, as of 2006, well-known alumni of National Taiwan University includes twenty domestic university presidents and ninety-one members of Academia Sinica, among which one member was awarded the Nobel Prize and at least fifteen were admitted to the U.S. Academy of Sciences. In political circles since the 1990s, its graduates have increasingly replaced politicians trained by universities in the Chinese mainland before 1949, and have occupied most of the minister-level positions within the government.

Natural Preserve Zones were established in 1956 in China. The following years saw a slow increase in numbers, from nineteen zones designated in 1956 to fifty-nine in 1979. As of 2007, 303 natural preserves on the national level had been set up throughout China’s provinces and Autonomous Regions to preserve the unique natural scenic beauty and the biodiversity of rare or endangered animal and plant species.

Natural Preserve Zones were established in 1956 in China. The following years saw a slow increase in numbers, from nineteen zones designated in 1956 to fifty-nine in 1979. As of 2007, 303 natural preserves on the national level had been set up throughout China’s provinces and Autonomous Regions to preserve the unique natural scenic beauty and the biodiversity of rare or endangered animal and plant species.

The establishment of natural preserve zones—also called nature reserve zones—marked a milestone in China’s growing awareness of and efforts at environmental protection. The first such zone was established in 1956. China had nineteen zones by 1965 and fifty-nine by 1979, many of which were later devastated due to lack of attention during the Cultural Revolution (1966–1976). By 1985, 360 natural preserve zones, found throughout China’s provinces and Autonomous Regions (A.R.s), had been designated as a result of the Environmental Protection Law issued in 1979, followed by a series of laws and decrees for natural environment and resources protection.

Natural preserve zones are usually designated by legislatures on different administrative levels, ranging from state departments to provincial governments to county governments. By 1990, 606 natural preserve zones on all levels had been set up after passage of the China Nature Protection Compendia in 1978. As of August 2007, 303 nature reserve zones at the national level had been established, and there were 2,349 nature reserves (of all levels) covering 1.5 million square kilometers, or some 15.6 percent China’s land territory.

Dinghushan (Guangdong Province) was the first national natural preserve zone, established in 1956. Dinghushan has a lake on its summit in the shape of a ding (an ancient cooking and sacrificial utensil with two loop handles and three legs), hence its name. With its lush forests, the preserve is celebrated as a “living museum of natural history” and “the gene reserve” for south China biological species.

Changbaishan Nature Reserve (southeastern Jilin Province) was set up in 1960 and promoted to a national natural preserve zone in 1986. It is the zone in China incorporated into the United Nations Educational, Scientific and Cultural Organization (UNESCO) Man and the Biosphere (MAB) Program. Changbaishan includes forest (16,081 hectares, 87.9 percent coverage), grassland (5,683 hectares), lakes, volcanoes, hot springs, and rare animals and vegetation. Changbaishan is noted for its biodiversity; 59 of its 1,255 known wildlife species and 25 of its 2,277 known wild plant species are classified under first-class national protection. Tianchi 天池 (Celestial Pool, 402 hectares) is a volcanic lake, the deepest lake in China (reaching a depth of 312.7 meters). A dozen hot springs (60°C–82°C) cluster around Tianchi, reflecting the Changbai Waterfall.

Wolong 卧龙 National Nature Reserve (northwestern Sichuan Province, 200,000 hectares), the third largest in the nation, was established in 1963. As the first natural resource-protection special administrative district founded...
in China, Wolong was integrated into the UNESCO MAB program in 1980. As the core area for giant panda protection and research, Wolong was named a World Natural Heritage site in 2006, providing a habitat for more than fifty species of wildlife, three hundred species of birds, and other rare species.

“Pure Buddhist Mountain”

Fanjingshan National Nature Reserve (northeastern Guizhou Province) was established in 1978, promoted to a national nature reserve in 1986, and enlisted in the UNESCO MAB Protection Network in the same year. Fanjingshan, meaning “pure Buddhist mountain,” has had a national reputation since the sixteenth century for its cultural heritage of numerous Buddha temples, attracting pilgrims to its beauty. Its steles (carved or inscribed stone slabs or pillars used for commemorative purposes) showcase the treasures of traditional Chinese calligraphy. In a religious sense the colorful halo appearing on the summit is a sign of auspiciousness.

Wuyishan National Nature Reserve (northern Fujian Province) was established in 1979 and integrated into the UNESCO MAB Program in 1986. The reserve has the largest and best-preserved semi-subtropical forest ecosystem on the same latitude in the world. In addition to the precious animal and plant species that inhabit this reserve, Wuyishan is noted for its scenic landscape.

Xilin Gol National Natural Reserve (Inner Mongolia A. R., 1.1 million hectares) was designated in 1985 and promoted to a national nature reserve in 1997. It was incorporated into the UNESCO MAB Program in 1987. Xilin Gol is the first grassland reserve in the nation established for precious wildlife and plant species.

To date, twenty-eight national nature reserve zones have been incorporated into the UNESCO MAB Program, including the zones discussed earlier. Additional natural preserve zones integrated into the UNESCO MAB Program (listed chronologically and followed by what they are meant to protect) include:

- Shenlongjia Nature Reserve (1990) in Hubei Province (golden monkey, dove tree, and other endangered primitive plants and animals)
- Mount Bogda Nature Reserve (1990) in Xinjiang Uygur A. R. (endangered animals, including swans and leopards)
- Yancheng Nature Reserve (1992) in Jiangsu Province (red-crowned crane and other precious birds)
- Xishuangbanna Nature Reserve (1992) in Yunnan Province (tropical rainforest ecosystem)
Natural Preserve Zones

- Tianmushan Nature Reserve (1996) in Zhejiang Province (subtropical forest ecosystem)  
- Fenglin Nature Reserve (1997) in Heilongjiang Province (red pine)  
- Nanlu Islands Nature Reserve (1997) in Zhejiang Province (wildlife, plants, natural scenery, and cultural landscape)  
- Baishuijiang Nature Reserve (2000) in Gansu Province (giant panda)  
- Gaoligongshan Nature Reserve (2000) in Yunnan Province (subtropical animals and plants)  
- Baotianman Nature Reserve (2001) in Henan Province (temperate-subtropical ecotone [relating to a transition area between two adjacent ecological communities] ecosystem)  
- Foping Nature Reserve (2004) in Shaanxi Province (giant panda and other rare animals and plants)  
- Xingkaihu Nature Reserve (2006) in Heilongjiang Province (high-altitude wetland ecosystem)  

The list of natural preserve zones will enlarge year by year. In January 2008 the SEPAC (State Environment Protection Administration of China) established an additional nineteen national nature reserve zones: Bahuashan (Beijing Municipality); Upper Reaches of the Luanhe River and Maojingba (Hebei Province); Daqingshan (Inner Mongolia A. R.); Zhenbaodaoy Wetland, Hongxing Wetland, and Shuanghe (Heilongjiang Province); Junzfeng (Fujian Province); Poyang Lake Nanji Wetland and Matoushan (Jiangxi Province); Kunyuushan (Shandong Province); Qizimeishan (Hubei Province); Jiemuxi, Bamianshan, and Leizhou Rare Marine Creatures (Guangdong Province); Jinzhongshan Mrs Hume’s Bar-tailed Pheasant (Guangxi Zhuang A. R.); Diaoluoshan (Hainan Province); Haizishan (Sichuan Province); and Tianhuashan (Shaanxi Province).

Natural Resource Preservation

Zirán zīyúán de bǎohù 自然资源的保护

Claiming a land territory of 9.6 million square kilometers and a marine territory of 4.72 million square kilometers, China once was considered to be a vast territory with abundant resources. But since the late 1970s the country has increasingly found its natural resources limited, given its huge population of 1.33 billion.

With the recognition of its limits in natural resources and the impact of these limits on its growth, China has intensified its efforts to preserve natural resources since the 1980s. A legal framework, currently with twenty-five laws and over 2,000 administrative decrees and regulations, has been set up to preserve and rationalize the use of natural resources, but while it needs to be perfected, the country lacks an administrative body to oversee the preservation of natural resources and an efficient regime to enforce the laws.

Limits

Land has been regarded as the source of life in China since ancient times, and inequitable distribution of land ownership was the cause of many peasant uprisings and revolutions. The first action that the new government took after the founding of the People’s Republic of China in October 1949 was to redistribute land among the country’s vast peasantry populace, who accounted for more than 90 percent of the population. Even though China actually annulled private ownership of land in the late 1960s, land has remained its most precious natural resource. Yet, China’s per capita land area is 0.8 hectare, only 29 percent of the world average, although China ranks third in the world in terms of total land mass. Because more than two-thirds of China’s land territory is covered by hills and mountains—many denying accessibility—and deserts, China’s arable farmland is meager at 0.11 hectare per capita, one-third of the world average.

These limited land resources, arable farmland in particular, are giving way to urbanization, mining, and desertification. From 1993 to 2003 alone, according to the Ministry of Land and Resources, China lost 6.6 million hectares of arable farmland, mainly to urban expansion and desertification.

China has felt its disadvantages in other resources as well. China leads the world in reserves of a number of minerals, but after they are divided by its population, the quantity drops below average. Among China’s 171 discovered varieties of minerals, 45 are in low per capita quantity, less than half of the world average. The per capita quantity of petroleum is merely 11 percent of the world average, and that of natural gas is only 4.5 percent.

Since 1949 the People’s Republic of China has basically followed the concept of self-reliance and based its development on its own resources, although since the 1990s it has relied more and more on importation of such resources as petroleum, iron ore, and timber. With the recognition of its limits in natural resources and the impact of these limits on its growth, China has taken efforts to preserve its natural resources.
Legislation

China has yet to enact a general law on the preservation of natural resources, but the revised Constitution in 1978 incorporates the provision that the state protect the environment and natural resources, which marks the first time that environmental protection and preservation of natural resources entered the country’s fundamental law. The Law of Environmental Protection enacted in December 1989 covers all the natural and human elements that may affect human subsistence and development, embracing water, marine, land, mineral, forestry, grassland, wildlife resources, and natural and cultural heritages. This means that the Chinese concept of environmental protection covers natural resources as well. Twenty-five laws and more than two thousand administrative decrees and regulations focus on or are related to the preservation of designated natural resources, including land, mineral, energy, forestry, grassland, wildlife, water, fisheries, marine, and space resources. These laws constitute a legal framework aimed to rationalize the use of natural resources and guarantee a coordinated and harmonious development of human society and nature. China is also a party to the Convention on Biological Diversity and the Cartagena Protocol on Biosafety, two UN documents that call for the preservation of natural resources.
Chinese law stipulates that all natural resources in China belong to the state. Part of forests, land, and water in rural areas can be collectively owned, but individuals can obtain the right only to use rather than to own these resources. Although laws permit legitimate transfer of this "right to use" resources such as with land, no individual or organization can sell land per se.

The main goal of legislation regarding the preservation of land resources is to maintain the size of farmland, preventing its further shrinkage from urban expansion. Governments at various levels must have their respective master plans that divide land into three categories: farmland, land for construction and other use, and barren wasteland. Each category has specific regulations, and deterioration, devastation, encroachment, and acquisition of cropland are not allowed. Although laws encourage organizations and individuals to reclaim wild land under the prerequisite of protecting and improving the ecosystem and guarding against wetland erosion and desertification, with priority given to farming, the laws forbid any reclamation at the cost of forests, grassland, and lakes. Since 1998 action has been taken to return farmland so reclaimed to forests, grassland, and lakes.

The same principle is applied to the preservation of wetlands, wildlife, and marine aquatic products. With a forest coverage of 18.1 percent, compared with the world average of 30 percent, China has yet to enact a general law on the preservation of natural resources, but a 1989 Law of Environmental Protection broadly defines them as water, marine, land, mineral, forestry, grassland, wildlife resources, and natural and cultural heritages. 

**Photo by Wen Bo.**
30 percent, China ranks 130th in forest coverage in the world and is among the most impoverished in forest resources. Between the 1950s and the 1990s the area of natural wetlands shrank by 36 percent, and 15 to 20 percent of wildlife species are on the verge of extinction. In order to preserve these resources, China has adopted laws to ban the logging of natural forests in the upper reaches of main river systems, to stop the reclamation of wetlands in the northeast, to ban the hunting of endangered wildlife species, and to enforce periodic fishing bans along the coast. Meanwhile, a quota system is imposed on logging of artificial forests; the rate of consumption must not surpass the rate of forestation.

Laws on the preservation of grassland resources prohibit overgrazing and digging shrubs or medicinal herbs in desertified or semidesertified grassland areas, lest the vulnerable vegetation be further damaged.

Legislation regarding mineral resources highlights the principles of exploiting resources in the course of protecting resources and vice versa. Although the state forbids private ownership of mineral resources, exploration and mining rights can be granted to qualified investors. Mining enterprises are levied resource taxes and compensations and are obligated to recover any cropland, grassland, or forests damaged by mining. All environmental/resource laws have provisions of legal liability. Violations can incur punishment ranging from penalties to imprisonment or even capital punishment.

**Saving Energy**

China relies on multipurpose and economical use of its natural resources, particularly minerals and energy, as a means to preserve these precious resources. As a rapidly developing country with an annual gross domestic product (GDP) growth rate averaging above 9 percent for the past twenty-eight years, China is an energy-consuming giant. Because of backward technologies, however, China lags far behind industrialized countries in energy efficiency. According to the *Energy Development Report of China 2007*, prepared by the International Energy Agency, China’s energy consumption for every $1 million of GDP is 2.5 times that of the United States, 5 times that of the European Union, and 9 times that of Japan.

However, the Chinese government has always advocated reducing consumption and saving energy. Between 1980 and 2000 the country managed an average GDP growth rate of 9.7 percent at an average energy consumption growth rate of 4.6 percent. At the end of 2005 China went further to set a target of reducing its energy consumption by 20 percent between 2006 and 2010. The central government has signed energy-saving accountability pacts with governors, and failure to reach the energy-saving goal may affect the promotion of concerned officials. In 2006 the yearly growth rate of per unit of GDP energy consumption dropped by 1.2 percent, and during the first six months of 2007 the figure dropped by 2.78 percent. Although these figures fell short of the annual reduction rate of 4 percent, the progress has boosted China’s confidence in accomplishing the 20 percent reduction rate by 2010. Meanwhile, China has accelerated the pace to develop renewable energy resources, including hydropower, wind power, biogas, and solar energy.

**Nature Reserves**

With more than 30,000 species of higher plants and 6,266 species of vertebrates, China is rich in wildlife resources. Yet, low forest coverage, soil erosion, desertification, and deforestation and other human exploitation have led to the reduction of biodiversity and endangered the domains of wildlife. Statistics from the State Forestry Administration indicate that 44 percent of wild fauna and 29 percent of wild flora are yet to stabilize.

China places a priority on setting up nature reserves and takes the establishment of such reserves as a measurement of the nation’s level of civilization. Since 1956, when China set up its first nature reserve at Dinghushan in Guangdong Province, the country has established 2,349 nature reserves covering 1.5 million square kilometers, or 15.6 percent of the country’s land territory. The reserves have preserved ecosystems ranging from forests, grasslands, alpine meadows, deserts, wetlands, and inland water areas to marine and offshore areas. The reserves include rare and endangered species of wildlife, distributed from the “roof of the world” on the Qinghai-Tibet Plateau to marshlands in the coastal areas. The current annual budget for the national reserves is 445 million yuan.

Although the nature reserves disallow any attempt at economic development, dereliction of duty in management does occur, coupled with unauthorized tourism and
other misconduct. These factors constitute challenges to the preservation of natural resources in the reserves. Residents who had lived in the spheres of the reserves before their establishment may also pose problems, and their attempts at subsistence could jeopardize the ecosystem. For instance, in some reserves where vegetation is vulnerable, local residents’ daily need for firewood may conflict with preservation. Measures have been taken to institutionalize the regime so that local communities can share the benefits of the preservation of natural resources and to transform the communities into allies of preservation.

Similar problems occur in legislation. As Zhou Ke, law professor at Renmin University, has observed, most legislation related to the preservation of natural resources has been centered on the prevention of pollution, whereas legislation related to the preservation of natural resources is absent. Although the two often go hand-in-hand, environmental protection and preservation of natural resources cannot be mutually substituted. Some scholars have proposed that China have a basic law specific to the preservation of natural resources.

Xiong LEI

Regime

Although the Environment and Resources Protection Committee of the National People’s Congress, China’s top legislature, is in charge of legislation and supervision of work in preservation, China lacks an administrative body to oversee the preservation of natural resources. The preservation of resources is, in fact, distributed among several government organs, and each organ can be responsible for both the exploitation and the preservation of resources. For instance, the State Forestry Administration is charged with timber industry oversight, forestation, and preservation of forest resources. Likewise, the Ministry of Water Resources taps the country’s hydropower potential, builds hydropower projects, and preserves water resources. This arrangement may raise the issue of conflicts of interest over the exploitation and conservation of resources. The State Environmental Protection Administration is above such conflicts of interest but is believed to be preoccupied with environmental protection rather than preservation of natural resources.

Needham Research Institute

Li Yuēsè Yánjiūsuǒ 李约瑟研究所

Founded by the scholar Joseph Needham (1900–1995), the Needham Research Institute provides facilities and research materials for specialists in the history of East Asian, especially Chinese, contributions to science and medicine. Resources include an extensive document library and other materials on East Asian science and culture and a program of seminars by scholars from around the world.

The mission of the Needham Research Institute, founded by scholar Joseph Needham (1900–1995), is to provide scholars with excellent facilities for research into the history of science, technology, and medicine in East Asia, most prominently China. The Institute, which houses the East Asian History of Science Library and is home to the Science and Civilisation in China project, is situated in west Cambridge, England, on the grounds of the University of Cambridge’s Robinson College.

History

The Institute was founded in 1976 by the Cambridge University biochemist Joseph Needham, who focused his work beginning in 1937 on investigations of the scientific and technical contributions of the Chinese people to human culture. These investigations became the Science and Civilisation in China project, which resulted in the publication of an ongoing series of volumes by Needham and his collaborators covering Chinese accomplishments in science and applied technology throughout history. Joseph Needham assembled a unique collection of Chinese, Japanese, and Western language materials. The collection is the basis of the East Asian History of Science Library. The Institute’s building, completed in 1987, was designed to include references to Chinese architecture as a way to reflect the nature of the work done there. Temple-like columns, octagon-shaped door and window openings, and the use of traditional Chinese colors on the exterior are among such features.

Resources for Scholars

Scholars working in the Institute typically include collaborators on the Science and Civilisation in China project, established academics on sabbatical, doctoral and post-doctoral researchers on one-year fellowships, and other shorter term visitors from around the world. The Andrew W. Mellon Foundation is one of several organizations who fund fellowships to United States–based East Asia scholars and researchers for study at Needham Research Institute.

Open to all scholars, the library collection contains primary and secondary works in Chinese, English, Korean, Japanese, and other languages on the history of traditional East Asian science, technology, and medicine. The core of the collection includes correspondence, notes, photographs, maps, and other material assembled by Needham and Lu Gwei-Djen as part of their research.
for the series of publications *Science and Civilisation in China*. Since the early 1990s, the library has invested in purchases of recent Chinese publications, especially in the areas of the history of Chinese mathematics, astronomy, medicine, and archaeology. The Library also has a modest collection of several hundred traditional Chinese thread-bound books, with some old and rare editions. The library is working to develop its collection of materials on the history of science, technology, and medicine in other parts of East Asia, such as Japan and Korea.

The Institute sponsors a program of seminars held weekly throughout the academic year. Seminar topics for 2009 include, among others, “Peacocks and Poetry: Image and Text in Qing Illusionistic Painting,” and “Agricultural Technologies for the Alleviation of Natural Disasters in *Qimin yaoshu*” (an early Chinese monograph on agriculture).

### Administration and Funding

Responsibility for the management of the Institute rests with the Trustees of the Needham Research Institute, which is a registered charitable trust. Until 2002, the Trust was directed by Professor Ho Peng Yoke, a member of Academia Sinica, who worked without salary to develop the Institute’s international contacts and to investigate fund-raising possibilities. In October 2003, the Institute appointed a full-time salaried Director, Christopher Cullen. Professor Cullen, who originally trained as an engineer, is an Honorary Professor of the Chinese Academy of Sciences and president of the International Society for the History of East Asian Science, Technology, and Medicine. The Institute, as an independent foundation, receives no public funds. Its main income comes from its endowment, which is administered by the Trustees of the Needham Research Institute, but it is also active and successful in obtaining funding from foundations, including the East Asian History of Science Trust. A substantial donation from the Chinese Civilisation Educational Trust in Hong Kong funded the new full-time Directorship.

**The Editors**

### Further Reading

Joseph Needham, a biochemist from the University of Cambridge, became fascinated with Chinese culture. His major work, *Science and Civilisation in China*, documents Chinese achievements in science, mathematics, technology, and medicine. Denounced in the West for supporting claims of Americans’ use of biological weapons in Manchuria, his continued work on *Science and Civilisation* brought renewed respect.

Needham in China

Needham’s interest in China was piqued by the three visiting scholars, so he started learning Mandarin Chinese from one of the young women, Lu Guizhen, who became his mistress and lifelong companion. During World War II, Needham was sent to China to work with Chinese scientists escaping the Japanese invasion. The scholars were attempting to re-establish their universities away from the invading forces, and Needham arrived to aid in their escape and to help preserve archives and artifacts that belonged to the universities. Needham traveled on eleven expeditions throughout China and had many remarkable adventures along the way. During his first stay in China, Needham was a fellow of both the Royal Society and British Academy, and the director of the Sino-British Science Cooperation Office in Chongqing (1942–1946). During this time he wrote his first publication, *Chinese Science*, which combined the two subjects which engrossed him throughout his life: Chinese civilization and science.

In 1946 Needham left China and took up a position as the chair of the Natural Sciences division at the United Nations Educational, Scientific, and Cultural Organization (UNESCO)—a division that had not previously existed, but with Needham’s insistence was initiated in Paris that same year. After two years in this position he returned to England to teach and begin work on his *Science and Civilisation in China*, one of the most ambitious historical projects of the twentieth century. It was to be a complete exploration of China’s scientific and technological past. At first, Needham thought that his survey might be no more than eight hundred pages long, but he later expanded the work to seven volumes embracing all aspects of Chinese physics, mathematics, chemistry, astronomy, agriculture, and engineering. As he investigated each tradition, Needham uncovered more and more evidence...
of Chinese contributions in these fields. Joined in his effort by many leading Chinese, European, and American experts, *Science and Civilisation in China* includes seventeen volumes with an additional dozen in preparation under the supervision of the Publications Board of the Needham Research Institute. Other important works by Needham and his collaborators include *The Grand Titration* (1969), which explores the reasons why the Chinese, whose achievements in science and technology were the most advanced the world from the first through the fifteenth centuries, were overtaken by Europeans in the Renaissance, and *Heavenly Clockwork* (1960), a detailed and fully illustrated account of astronomical and mechanical clocks in medieval China.

**Needham's Grand Question**

The encyclopedic scale of *Science and Civilisation in China* is explained by the scale of the central question Needham sought to address in his work: why, despite China’s early scientific and technological sophistication, the scientific and industrial revolutions were experienced first in Europe, and not in China. Needham’s answer was to look at the imperial bureaucracy. This official elite, he believed, might have initially supported technological innovation, but later stifled curiosity and prevented the widespread application of new ideas and techniques in areas outside of elite interests.

**Needham’s Worldview**

Needham’s reputation is marred by criticisms of his politics and his work. He supported the Chinese revolution in the late 1940s, and after 1949 became sympathetic to the Communist government. During the Korean War, he supported Chinese claims that Americans used biological warfare against the Communists, a claim that has never been proven. He was blacklisted by the United States government until the 1970s.

Outside Cambridge, Joseph Needham’s interest in the history of Chinese science also stimulated many Asian scholars’ exploration and documentation of their own scientific past. The founding of many prominent research institutes and museums in China, Japan, and Korea devoted to Asian science, technology, and medicine are in part due to Needham’s enthusiasm and encouragement.

Joseph Needham died at the age of ninety-four at his home in Cambridge. In 2008, the University of
Cambridge chair of Chinese was renamed the Joseph Needham Professorship of Chinese History, Science, and Civilisation.

Neo-Confucianism, beginning in the eleventh century, was a revival of classical Confucian values with new interpretations. It focused on self-cultivation, emphasizing development of rational, moral, and affective natures so that the heart and mind entered into “one body” with Heaven and Earth and all creation.

Beginning during the Song dynasty (960–1279) in the eleventh century, neo-Confucianism was a major reformulation of Confucianism that brought a revival of classical Confucian study and thought. Confucian values, texts, and practices were reworded and reinterpreted, mirroring the changed cultural conditions of the Song dynasty. Neo-Confucianism also reacted to the religious and philosophical challenges from Daoism and Buddhism in the postclassical age of the Zhou dynasty (1045–256 BCE) and Han dynasty (206 BCE–220 CE).

The late Song scholar, philosopher, and teacher Zhu Xi (1130–1200) summed up many of the contributions of this Confucian revival. His teachings became so dominant in East Asia that Zhu’s “learning” came later primarily to be identified as neo-Confucianism. Earlier this learning had been known as the “Learning of the Way” (dao xue), the “Learning of Human Nature and Principle” (xingli xue), the “Learning of the Sages” (sheng xue), the “Learning of Principle” (li xue), and the “Learning of the Mind-and-Heart” (xin xue). These referred to important aspects of the larger learning that inspired a new cultural era in East Asia and subsequently came to represent its tradition. To modernizers of the twentieth century it represented the past from which they wanted to break.

“Great Peace and Order”

Neo-Confucianism sprang from a revived concern for civil government as opposed to warlordism during the late ninth and early tenth centuries. It sought to bring about “Great Peace and Order” (Taiping) by establishing civilized institutions. The statesman Fan Zhongyan (989–1052) expressed the ideal of public service at this time in his characterization of the Confucian ideal of the noble person as “first in worrying about the world’s worries and last in enjoying its pleasures” (de Bary and Bloom 1999, 596). Using the rulership ideal of the Confucian philosopher Mencius, Fan articulated the solicitude that a ruler should have, placing first the welfare of the ruled, in contrast to the Buddhist bodhisattva (a being that refrains from entering nirvana in order to save others and is worshipped as a deity), who first sought the peace of nirvana before returning to share it with others.

Fan attempted reforms in education and the political economy, but he also invited the scholar-teacher Hu Yuan (993–1059) to court. Hu as an educator emphasized the principles and implementation of classical Confucianism through studies in mathematics, law, military arts, and water control. The statesman Wang Anshi (1021–1086) advocated many of Fan Zhongyan’s reformist ideals, especially in the civil service and education. Wang stressed government intervention in the economy and a policy that
Neo-Confucianism, which sprang from a revived concern for civil government as opposed to warlordism during the late ninth and early tenth centuries, sought to bring about “Great Peace and Order” by establishing civilized institutions. It brought together theories from the philosophies of Confucius, Laozi, and Buddha. Here we see the premier philosophical leaders of China portrayed as “three vinegar tasters,” each reacting to the taste of the vinegar in their own way.

would achieve a type of welfare state. His policies, which claimed the approval of the Confucian classics, especially the Zhou li (Rites of Zhou), nevertheless were considered “New Laws” because of their innovations.

Several philosophical speculations, in response to the challenge of Mahayana Buddhism, sought a better metaphysical foundation for the new civil order. These speculations later were incorporated in Zhu Xi’s system. Zhou Dunyi (1017–1073), in contrast to the Buddhist view of impermanence and the insubstantiality of all things, based his philosophy on the I Ching (Classic of Changes) and characterized the Way (dao) as a process of creation and re-creation in which change is marked by growth and renewal rather than by continual negation. Zhou perceived this Way not only as limitless (wuji) but also as a path to perfecting the natures of all things (taiji). As an alternative to attaining Buddhahood (a state of perfect enlightenment sought in Buddhism), Zhou advocated the cultivation of sagehood—the perfection of spirituality based on intellectual and moral values.

Zhang Zai (1020–1077) was another thinker of the Song dynasty. His ideas were incorporated into Zhu Xi’s later synthesis. Zhang affirmed qì—the psychophysical substance—as the vital force in all things and advocated an ethical cultivation designed to achieve unity with all creation in his Xi ming (Western Inscription). The Cheng brothers were two other thinkers of the Song dynasty. Cheng Hao (1032–1085) and Cheng Yi (1033–1077) advocated cultivating sagehood to achieve the “Humanness which forms one body with Heaven and Earth and all things” (de Bary and Bloom 1999, 694). The Chens perceived the “one body” to be a compound of qì and a generic and genetic principle (li) inherent in all things, which forms an inner principle for growth. People were to deal with principle, in both a rational and a moral sense, in both its diversity and unity. Humanness meant the empathetic attraction among all things and was differentiated according to the relations of factors such as rightness in relation to rulers or filiality (relating to a son or daughter) in relation to parents.

Zhu Xi compiled these concepts and others of his predecessors in a guide for self-cultivation entitled Jinsi-lu (A Record of Recent Thought or Thinking about Things Near-at-Hand). In addition he wrote commentaries on classic texts—the Analects of Confucius, the text of Mencius, the Da Xue (Great Learning), and the Zhong yong (Doctrine of the Mean). These are referred to as the “Four Books.” The Zhong yong and the Da Xue were chapters taken from the classic Li ji (Record of Rites). Zhu, in his prefaces to the Zhong yong and the Da Xue, urged individual cultivation and universal schooling as the basis for all public morality and governance. He urged using moral judgment and intellectual investigation to reach an empathetic understanding of all things. In the Zhong yong preface he wrote of the succession to or repossession of the Way of the Sages as being based on classical texts and on the recognition of basic principles in those texts by insightful people, in contrast to private experience communicated from mind to mind through Zen lineages. In
addition Zhu urged a technique of self-control and self-examination, called the “Method of the Mind.” It encouraged people to exercise proper value judgments to achieve unity with all things.

Zhu wrote another anthology, *Xiao xue* (Elementary Learning) in further pursuit of the educational ideal at the center of his philosophy. This anthology addressed self-development and the training of young people in the home and in social relations. *Xiao xue* and the Four Books became standard texts in the neo-Confucian curriculum, along with *Zhu Zi jiali* (Family Ritual of Zhu Xi), which was Zhu’s simplified guide to family rituals.

Zhu, through these new versions of old texts, reshaped the classical Confucian tradition into a form that could be disseminated easily through the new medium of printed books. As a local official, Zhu also created guidelines for local schools, for the organization of community organizations, and for community granaries. These organizations became models for village life in much of East Asia. His lectures to the emperor on the classics became a standard practice in the courts of China and Korea. In short, neo-Confucianism, as Zhu Xi shaped it, was not only a systematic philosophy but also a cultural program.

Zhu Xi was often at odds with the Song court, which condemned his teachings as heterodox. Thus, the propagation of his ideas depended on his followers in local schools. The Mongol emperor Kubilai Khan (1215–1294) recognized the wide acceptance of Zhu’s teachings among Confucian scholars and authorized the teachings as official instruction in state schools. In 1314–1315 Zhu’s texts became the basis of the Chinese civil service examinations and remained so until 1905, when they were abolished. Meanwhile, Korean scholars at the court of the Yuan dynasty (1267–1368) returned to Korea with Zhu’s teachings. In Korea the Choson dynasty (1392–1910) made these teachings the official state teachings.

**Ming and Qing Dynasties**

Wang Yangming (1472–1529) during the Ming dynasty concentrated on the inner sources of moral sensibility to inspired a teaching that he perceived as being too given to book learning and too routinized in conduct. Wang encouraged disciples to respond spontaneously to the moral promptings of the heart-and-mind (which he called “innate knowledge or knowing”). Luo Qinshun (1465–1547), Wang’s contemporary and critic, tried to restore the balance in favor of objective learning and normative standards that were less given to subjective interpretation. The Donglin school subsequently reacted against the moral relativism that the more subjective branches of the Wang Yangming school seemed to fall into. However, the attempt to rescue the late Ming dynasty from both moral and intellectual decline did not prevent the dynasty from falling to the Manchus, who, after conquering China, reaffirmed Zhu Xi’s teachings as orthodox.

In fact, during the Qing dynasty (1644–1912), with Zhu Xi’s texts established in the civil service examinations and neo-Confucian scholarship promoted by the Manchu court, neo-Confucianism dominated the official scene. But in independent scholarly research the resolution of philosophical issues brought more critical scrutiny of the classics as the basis of authority on matters of orthodoxy and authenticity. The school of evidential learning, which developed during the seventeenth and eighteenth centuries, had mastered textual criticism that advanced this critical scrutiny. The leading figure in evidential learning was Gu Yanwu (1613–1682).

Such critical scrutiny extended to some of the metaphysical elements in Zhu Xi’s philosophy of human nature. The moralistic rigor of the early Zhu Xi school yielded to a perspective more accepting of human desire. However, the basic curriculum in most schools remained the texts as edited and interpreted by Zhu Xi. Into the late nineteenth century the general frame of intellectual reference...
and the terms of educated discourse, even among Zhu Xi’s critics, remained within the orbit of his thought. Also, because he had paid so much attention to the reform of social and political institutions, the encyclopedic learning and historical scholarship he encouraged continued to manifest themselves in statecraft studies, increasingly critical of many institutions of the dynasty. An example is Waiting for the Dawn (Mingyi daifanglu) by Hung Zongsi (1610–1695). Its critical stance later would have a bearing on the readiness of late Qing scholars to consider alternatives to established institutions and corrupt practices.

Korea and Japan

This great variety of neo-Confucian activity existed as well in Korea’s Choson dynasty. The new teaching had already been introduced to Korea under the preceding Koryo dynasty (918–1392), which had long been dominated by Buddhism. The new teaching inspired a new generation of scholars. They installed neo-Confucianism as the official ideology of the Choson regime.

One of the leading Choson neo-Confucian scholars was Yi Toegye (1502–1570), who stressed self-cultivation through the emphasis of reverence as a basic virtue and quiet sitting as a form of personal exercise. Yi also presented a variety of scholarly studies similar to those of Zhu Xi and became the model of Zhu Xi learning in Korea.

Shortly after Toegye, Yi Yulgok (1536–1584) expanded studies in the Zhu Xi school and laid the foundation for silhak (substantial learning or practical learning), which in the late eighteenth and early nineteenth centuries expressed an interest in the Western studies that were made available through Jesuit missionaries in Beijing. The neo-Confucian texts and curriculum remained standard in Korean education and provided the terms of educated discourse throughout this time.

In Japan the texts of Zhu Xi became available through Japanese Zen monks traveling in China during the thirteenth and fourteenth centuries. However, for the most part the study of Zhu’s works had a low priority until Japan’s unification and contacts with Korean scholarship in the late sixteenth century gave a new impetus to neo-Confucian studies. Former Zen monks such as Hayashi Razan (1583–1657), Fujiwara Seika (1561–1619), and Yamazaki Ansai (1618–1682) promoted neo-Confucian studies. Razan established a school under the patronage of Tokugawa Ieyasu (1543–1616), founder of the Tokugawa shogunate (1600/1603–1868), and Razan’s successors were given the hereditary patronage of the shoguns until the Tokugawa era ended.

Tokugawa Japan had no institution equivalent to the examination systems and civil bureaucracies in China and Korea to be a standard of official orthodoxy. Instead independent schools embraced different lines of study. For example, Yamazaki Ansai stressed culture of the mind-and-heart with adherence to Zhu Xi and the practice of quiet sitting. Kaibara Ekken (1630–1714) popularized neo-Confucian ethics as shared by different classes and status functions but also participated in empirical studies of nature. The Mito school emphasized the Confucian concepts of loyalty and dynastic history. In Osaka residents supported a local school, the Kaitokudo, that taught neo-Confucian ethics oriented to the merchant class.

Scholars eventually challenged some Song era aspects of neo-Confucianism as being manifestations of the subversive influence of Buddhism rather than true innovations of original Confucian ideals. A military instructor of the samurai class, Yamaga Soko (1622–1685), decried the contemplative tendencies of Song neo-Confucianism, especially quiet sitting. He felt they were unsuitable for a samurai. Ogyu Sorai (1666–1728) proclaimed that Confucianism could be understood only in the context of early Chinese history and society as shown in the Chinese classics and that Confucianism was applicable to Japan only in the context of Japanese institutions and their historical development. Ito Jinsai (1627–1705) taught a fundamentalist brand of Confucianism that emphasized humaneness as taught in the texts of Confucius and Mencius. Each of these forms of Confucian revisionism made a claim to a fundamentalism based on new readings of classical texts.

During the late Tokugawa shogunate independent schools proliferated and created a wide variety of scholarship. Some of the scholarship was oriented toward Japanese tradition and some of it toward Western learning. The basic texts used in most schools were based on the neo-Confucian curriculum set by Zhu Xi until the imperial restoration and renovation of the Meiji period (1868–1912). The moral and intellectual formation of most
educated east Asians continued to be based on this neo-Confucian discourse into the late nineteenth century. This teaching concentrated on self-cultivation in a social context and emphasized the development of rational, moral, and affective nature so that the mind-and-heart entered empathetically, through practical action and shared principles, into “one body” with Heaven and Earth and all creation.
